THIRTY-THREE.

JANUARY—
JUNE.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

THE ARCHITECTS' & BUILDERS' JOURNAL.

*A Weekly Journal for Architects Surveyors
Builders and Constructional Engineers.*

*It is our aim, our ambition, our aspiration even,
to build our Journal worthily and well, not
for the hour only, but for future years; for the
few men in the forefront of an enduring and
a laborious art; for the disciplined ranks of a
distinguished profession; for the young men—
Architects to be—and for all who love a clustered
column or a flying buttress, a traceried window
or a Greek frieze; for the man, too, who honestly
plumbs a jam.*

CAXTON HOUSE, WESTMINSTER.

CONTENTS.

See also Concrete and Steel Section.

ABBEY ANNEXE, WESTMINSTER,

241, 355.
Abbey, Selby, Completion of, 591.

The New Architectural Centre in London.

VERY now and then there develops, in some quarter of London, a building movement, generally connected with some large street improvement or the laying out of a new building estate, which tends to a local architectural development with a local character of its own. The formation of the Bloomsbury squares and streets was one

instance, which perhaps would hardly be regarded now as an architectural development; it was an architecture of negation, of prim, plain brickwork externally, concealing a great deal of charming and tasteful interior detail, but admitting hardly anything of exterior architectural embellishment. Plain as it is, however, this architecture has a certain character, and whatever exterior detail was admitted in the shape of fanlight designs, front-door casings, and iron railings, was, in its quiet way, in excellent taste. The alterations which have been made in some of these Bloomsbury streets and squares, with a view of rendering them, it is supposed, more attractive to possible residents, have not been improvements; and the great gewgaw hotel in Russell Square makes the unspoiled Bedford Square quite attractive by comparison. Harley Street and Wimpole Street come into the same category; once fashionable streets, in days when interior refinement and taste in a town home were more prized than external display.

The Regent Street epoch followed, the largest and most important London street architecture development of the last century, which extended its influence also to Portland Place and the terraces of Regent's Park. Brick had given way to cement now; it had been discovered that the charms of Classic architecture could be realised, after a fashion, without the expense of stone; and things went on merrily on this line, the example spreading widely to the squares and streets of the Hyde Park and Kensington districts. But the notable point about Regent Street was that it was a conscious and elaborate attempt to treat a long street as one comprehensive architectural design. So important was this considered, that long panoramic elevations of both sides of the street were made and are now preserved in the Crace collection at the British Museum. The comprehensive design has been much cut into of late years, which, considering modern commercial conditions, was perhaps unavoidable. But on architectural grounds it is to be regretted. Nash's design was an interesting attempt to treat an important street as a connected whole; in that respect it is unique in London, and it is a pity that it should not have remained untouched.

Then came the return to brick architecture in a very different fashion; the formation of neighbourhoods of large and picturesque brick houses of the type which gives special character to Pont Street and Cadogan Place and Collingham Gardens; an architecture in many respects very effective, and most of it in good taste, many of the houses being the work of eminent architects, but perhaps somewhat deficient in

repose. It is the opposite extreme from the brick architecture of Bloomsbury.

And now we have a new architectural centre in formation about the new street lines of Aldwych and Kingsway, an architecture which, like that of Nash's Regent Street, is mainly that of shops and business buildings, not of residences. There is nearly a century between the two, and fully a century in architectural difference. Cement is quite at a discount now; brick is not good enough; everything in this last new quarter of London is of stone, and is a far more costly architecture than was thought possible, in the days of Regent Street, for any but public buildings of the first importance. But in a manner one is reminded of Regent Street, for the problem is a good deal the same. In the one case there is a quadrant leading up to a long line of straight street running north; in the other case there is a crescent with a long straight street running northward from the centre of it; the more dignified arrangement of the two. And there was in contemplation another point of similarity between this and Regent Street, for it was evidently intended at first that the crescent and the street should each form a comprehensive symmetrical design.

Architecturally speaking, it is a thousand pities that this intention was abandoned; in the circumstances it was perhaps unavoidable. But the abandonment was made too lightly, and without giving the subject sufficient consideration. Of course it may be said that the example of Regent Street shows how difficult it is to keep a general design complete under altered conditions of trade. It is easier to make a symmetrical design in a residential street than in a commercial one, because it can there be assumed that the houses are mostly for the same class of requirements, and the same class of tenants, and at all events it is easy to combine smaller and larger houses in groups which may architecturally alternate and contrast with each other, thereby giving variety along with symmetry; while in buildings for trade purposes one can never predict precisely what will be wanted by different tenants. Architectural unity in trade streets of the higher class has, however, been successfully adopted and maintained in Paris; and one cannot help thinking that what has been done in Paris could have been done in London, with a little more determination.

A certain harmony of style, however, does seem to be maintained so far in this new central architectural quarter of London. Classic types so far prevail, which is natural in a case where stone fronts appear to be *de rigueur*; and in fact we may probably conclude that the County Council authorities, though they have given up symmetrical design, would not sanction in either of these streets a front violently in contrast with those already erected, however good it might be in itself. The keynote seems to have been set by the first two buildings erected at the western extremity of Aldwych, the "Morning Post" offices and the Gaiety Theatre. The former was built, we believe, under rather rigorous municipal compulsion, and at a cost not altogether welcome to the proprietors. But considering the extremely prominent position of these two buildings in the approach to the new quarter

from Waterloo Bridge, the County Council were justified in demanding an important architectural treatment. Both buildings are bold and effective in general composition, though neither of them is altogether satisfactory or refined in detail. The block of offices immediately east of the Gaiety is, in refinement of detail, far superior to either of them, and is undoubtedly the best building yet erected in the crescent. It is to be hoped that the cupola feature on the Gaiety Theatre will be compelled to be repeated in a sufficiently similar manner at the east end of the island of buildings; the whole form and laying out of the building land requires that in order to justify and explain it. It was a great mistake architecturally that the Strand building line was not kept further northward to begin with, which would have left a fine place with St. Mary's Church in the centre of it, and St. Clement Danes at the eastern end, and would have avoided the method of junction with Fleet Street about which so much fuss has been made; but the western end of the block being already built the eastern end is bound to be carried out on lines symmetrical with it.

Of the new buildings in Kingsway, Mr. Belcher's Holy Trinity Church, which forms the subject of our principal illustration this week, is a remarkable and unusual example of Classic church architecture. The concave line of the lower portion of the façade may have been suggested by the façade of the memorial church in the Rue Jean Goujon at Paris; it at least recalls it. The tower is a good and picturesque attempt to give an expression of vertical and soaring character to an erection which, in accordance with the genius of classical architecture, must almost inevitably consist of separate storeys superposed, in contradistinction to the type of continuous tower which is available in Gothic architecture. The lofty proportions of the lower storey, and the gradual diminution in height of the two others, combine to produce a tower of pleasing and harmonious proportions; the only feature which we regret in it is the introduction of those unmeaning vertically hanging swags, as they may be called, depending from between the equally unmeaning projecting slabs of masonry. This is a detail which is merely a trick of the time, a kind of draughtsman's detail which seems to be inserted almost mechanically, and which an architect of Mr. Belcher's standing might have afforded to omit. It is, however, as a whole, a far superior façade to that of the other church in the new street, SS. Anselm and Cecilia, which is but a poor piece of design, although the interior has considerable merit and originality of treatment.

The business buildings, of which we publish some illustrations, show the kind of adherence to a similar type which renders them suitable for juxtaposition in the same street, as keeping up a certain prevalent character in the architecture. With one exception, Messrs. Gordon and Gunton's is the best and most coherent design; it is simply massed, and gains a good deal of dignity from the slightly projecting pavilions running the whole height of the building, and crowned by a curved pediment. Mr. Gibson's "Koh-i-noor House" has also the merit of simplicity and breadth of design, only we think the lofty arches in the ground storey, embracing two stories of floors (a feature which he has also employed in the elevation of Caxton House at Westminster) look rather too stilted as a base for a high building. Mr. Tanner's Craven House is less compact in design than these, and the varied shape and proportions of the openings in the ground floor, perhaps necessitated by the uses of the building, give it rather a broken-up and uncertain expression, though the whole building takes its place very well as part of the architecture of the street.

Mr. Lutyens's façade of Lincoln's Inn House must be classed apart from these. Though comparatively small and plain, this is a very unusual façade, showing a scholarly and thoughtful treatment of the materials of Classic architecture. The rusticated lower storey, with its Doric order and cornice, is admirably designed, and contrasts very happily with the

simpler treatment of the upper stories and the decorative pilasters and balustrade of the attic. This is a building in which every detail seems to have been carefully considered, and which must be regarded as something exceptional in modern street architecture. One would be glad to meet with more examples of the same refined character.

Site and Soil Troubles.

AT the annual general meeting of the Yorkshire Federation of Building Trades Employers, as reported on p. 680 of our issue of December 28th, attention was called to the judgment in the case of Boyd and Forrest v. The Glasgow and South-Western Railway Company. Although this case arose out of an engineering contract, it would appear, from the reference at the meeting in question, that the points involved are of equal importance to builders, and that therefore a brief summary of the case may be usefully placed on record in the Journal. It appears that Messrs. Boyd and Forrest, contractors, Kilmarnock, had sued the Glasgow and South-Western Railway Company for payment of £106,688 odd for work done in carrying out their contract for the construction of the Dalry and North Johnstone Railway, and the widening of the up-line between Dalry and Swinlees Junctions. Having contracted to do the work for £243,000, the firm found that in certain sections the material to be excavated turned out to be hard, whereas the schedules had led them to expect that it would be soft, and they sued for the extra cost entailed. Lord Johnston's opinion in the court of first instance was upheld. The Lord Justice-Clerk pointed out that, since the first advertisement of the contract appeared at the end of February, 1900, and the last on March 5th of that year, while tenders were required to be lodged on March 19th, it was obvious that the contractors were expected to rely on the information supplied by the railway company respecting the soils. His lordship thought it was proved that "many of the bores that the railway contractors put forward as information to intending contractors were not taken by competent borers, but by ordinary railway servants." There was a stringent clause in the contract debarring the contractors from redress in case of errors or discrepancies in the schedules; but this clause could not cover such misrepresentation as the case seemed to reveal, the information supplied by the borers differing in material particulars from that which was supplied to the contractors. This information turned out to be misleading to the contractors, and therefore vitiated the contract. That there was, on the part of the company or their agents no intention to cheat or injure the pursuers, Lord Ardwall declared, did not matter. Lord Dundas concurred, and the contractors were awarded the amount of their claim, with expenses. The case is doubtless of great importance so far as it goes; but the judgment should not be allowed to have the effect of lulling contractors into a sense of security which might in very slightly varying circumstances betray them into enormous loss. In the case under notice, the judgment obviously depended on the vitiation of the clause as to errors and discrepancies. In cases in which due care is taken to avoid such errors and discrepancies, the clause would probably hold good as against the contractor, who, generally speaking, is expected to take ordinary risks of this kind, and must therefore not expect to be indemnified for errors that in the nature of the case are unavoidable. Contractors should therefore insist on being given sufficient time in which to test the accuracy of the data upon which the contract is to be based, and on an equitable arrangement with respect to the cost of such verification. In builders' work, the difficulties usually arise with regard to sites and soils; and considering the numberless instances in which builders have suffered heavy loss and sometimes absolute ruin in consequence of unforeseen hindrances, as from springs, rocks, and treacherous strata, it would seem that they might profitably address them-

selves to the establishment of some more equitable provision against such contingencies. Granted that the client, like the builder, has not foreseen the treacherous character of the soil, why should the contractor be called upon to bear the whole burden of the unhappy and belated discovery, and even be further penalised because of the consequent delay for pumping, or shoring, or deeper excavation, or "rafting"? Setting aside legal refinements, the common sense of the matter would seem to be that the builder contracts to put a proper building on a proper site, and that a bad site should be the client's misfortune rather than the builder's. That this is not yet the authoritative view is because, to put the matter somewhat bluntly, the laws on the subject were conceived and framed before the builder had acquired the wholesome corrective influence with which organisation and publicity have but lately invested him; but that the interpretation of the law with regard to troublesome sites and soils is, generally speaking, extremely unsatisfactory from the contractor's point of view, and much too favourable to the client whose property is the fundamental cause of the mischief, is quite notorious.

The Burlington House Exhibition.

THE Royal Academy, instead of collecting an exhibition of "Old Masters," have varied the programme this year by an exhibition of the works of five deceased artists of the British School; namely, Orchardson, Frith, Macbeth, Swan, and David Farquharson; all of them painters belonging to a recent period. Such a collection is not equal in interest to an exhibition of Old Masters, and the five names make a rather curious combination. But there are a good many fine pictures on the walls, and the collection of a number of works by the same painter forms a good opportunity of judging of his merits and of the probable future position of his works.

One thing this exhibition leaves in no doubt; it is J. M. Swan, who is the most distinguished artist of the five. Orchardson's subjects, many of them, at least, are more important; Swan's subjects are mostly of very slight human interest, and he is least successful in his most serious subjects. "Orpheus" is mainly an animal picture, with a nude youth, whom we entirely decline to regard as a personification of Orpheus, capering among them; and "Dante and the Leopard," from the prologue to the "Divina Commedia," is a total failure as an illustration of that mystic poem; it is too realistic and matter-of-fact. Swan seems to have had no poetic conception, but he was emphatically an artist, with the true artist's power of handling slight subjects so as to give them beauty and significance, and one never realised this so fully as on seeing this roomful of his works. His exquisite little picture of the nude "Piping Fisher-boy" has that quality of completeness and inspiration in design and colour which makes it a possession for ever, a picture that it will always be a joy to look at, for future generations as well as at the present day. Such work as this is safe. The same exquisite painting is to be seen in "Nymphs Bathing," and "The Siren Ship," work to be valued for its artistic quality, not for its literary meaning; and this is what true art means. His animal pictures are quite apart from the ordinary class of animal painting. The two pictures of polar bears give the impression that the animal has been realised in painting for the first time; not the mere texture of its coat, but the essential nature of the animal; and the bronze of the "Puma and Macaw" is one of the most perfectly successful things that have ever been seen in the Academy sculpture room. In the Water-Colour room are a number of his studies of figures and animals.

Orchardson, as observed, painted more important subjects than Swan ever attempted, and it is in his most important pictures that he is at his best. "The Borgia," one of his most successful works, seems like a summing up of the refined wickedness of the Italian Renaissance, and it is really fine in

colour, and "The Young Duke" is a masterpiece of brilliant execution of detail, without losing breadth of effect. Orchardson had his own scheme of colour, too, which enabled him to give fine colour effect even to a portrait of a man in everyday dress, as in the half-length portrait of Mr. Henri Riviere. It must be felt, however, that a good many of his subject pictures here seem, in the artistic sense, rather commonplace after Swan's work; the literary element in them seems rather to overpower the artistic.

David Farquharson's fine night landscape, "Full Moon and Spring Tide," keeps its place completely, and strikes one as much as when it first drew everyone's attention on the walls of one of the annual exhibitions; and almost equally fine is his "Dartmoor," full of air and sunlight. These are examples of the real poetry of landscape painting, and one is glad to have an opportunity of seeing them again.

In comparison with such works, what is one to say of Macbeth and Frith? Macbeth is very largely represented not only by his paintings, but by a small roomful of his etchings (mostly from his own paintings), a branch of art which he handled with great success as far as execution went. But the collection together of a number of his paintings is an unfortunate experiment. It leaves on the mind no doubt that he is a painter who is done with. He pleased his generation more or less, in spite of his mannerism, but there is no life for the future in any of these things; they are paintings for the crowd, not for the artist. Frith, in one sense, has a better chance of remembrance, because some of his pictures, such as the "Railway Station," and the "Derby Day," may be called historical documents, careful representations of the manners and dress and general appearance of a generation which has passed. His large picture of "The Last Sunday of Charles II." is indeed a perfectly awful example of the kind of thing that used to be dignified by the name of "historical painting," but the "Railway Station," despite crude colour and utter vulgarity of style, is really an interesting and very faithful reproduction of the typical English crowd of the middle of the last century struggling for places in the train; and if the picture is examined in detail, it is surprising to find what a variety of carefully studied expression there is in the numerous faces portrayed; and in the figures of the two detectives there is a degree of real character beyond what Frith usually attained to. He seems to have been totally without any serious aim in art or the perception of anything higher than the merest commonplaces of life; but this subject was on a level with his intellect, and it is to his credit that in treating it he spared no trouble to make it, from his point of view, as complete as possible; and so the picture, in its own way, has a permanent value. There is a moral in this, perhaps, for painters of higher things. Careless painting does not last.

Public Works in Rome.

A LIST has been published of the public works effected by the State in Rome, since it became the capital of Italy, and of the sums expended on them. For work actually carried out by the State a sum of nearly £7,000,000 has been spent. To this must be added a little over £5,000,000 granted from time to time to the Roman municipality for improvements and embellishments in the city, making in all a total of about £12,000,000. The principal work carried out by the State has been the regulation of the Tiber, which up to the present date has cost, with bridges and embankments, a little over £4,000,000. This vast work is now nearly completed; only a small portion of the embankment remains unfinished, while the last new bridge, to be called the Victor Emanuel, will be opened at the beginning of next year, and has cost £1,280,000. The same sum, almost exactly, has been spent on the enormous monument raised to the memory of Victor Emanuel, which will be inaugurated in 1911. The great mass of this monument, with all its architectural ornament,

the Rome correspondent of the "Times" reports, has been finished, and many of the groups of statuary which adorn the approach will be in place before its inauguration. In the case of this monument, as in that of the new Chamber of Deputies, which should also be completed in 1911, at a cost of about £560,000, unexpected difficulties and consequent expense were found in laying the foundations. Another work, which has already cost but little short of £500,000, the carrying through of the Via Cavour to the Piazza Venezia, is very far from completion.

Wimbledon's New Theatre.

Mr. J. B. Mulholland's new theatre, in Merton Road, Wimbledon, which was opened on Boxing Day, is in Georgian Renaissance style, and the main feature is a tower, surmounted by a dome, above which is a balcony with columns and entablature, which in turn support a crystal ball with a winged figure above. The height of this figure is roof-top above the pavement. At night the ball is illuminated by the Mercury Vapour process, which throws out violet rays, and it may be seen for many miles round. The figure also is illuminated, and there are numerous arc lamps arranged round the building. Inside the theatre is shaped like a fan, the proscenium opening forming the handle end, and the width at the back of the pit being nearly double that at the front of the stalls. The house holds over 3,000. The decorations of the auditorium are also in a Georgian style, though not a pure example, Italian Renaissance having been incorporated. The main ceiling contains panels painted with allegorical groups. There are no boxes on the ground floor. The fronts of the boxes and of the tiers are of pierced and hammered brass with bronze enrichments. The circles are constructed on the cantilever system. Both the stage and the auditorium are heated equally, in order to prevent draughts. The lighting is by electricity from two sources. The plans have been drawn by Messrs. Cecil Masey and Roy Young to Mr. Mulholland's own designs.

THE ARCHITECTURAL PROFESSION IN REMOTE PROVINCIAL DISTRICTS.

By A. W. S. CROSS, M.A., V.P.R.I.B.A., and GEORGE HUBBARD,
F.S.A., F.R.I.B.A.

[In the case of signed articles it must of course be understood that we are not responsible for the personal opinions of the writers.]

IT has been said, with a considerable amount of truth, that one-half of the community does not know how the other half lives, and probably to no body of men is the saying more applicable than to the architectural profession. We do not know by whom, or by whose authority, the figures have been compiled, but the number of practising architects throughout the United Kingdom is usually estimated at about 6,000; and of these 6,000 architects, considerably more than a third of the number are unattached either to the Royal Institute of British Architects or to one of its allied societies, or the Society of Architects.

Thus cut off from active participation in the excellent work carried on both by the Institute itself and by the provincial societies in alliance with that body, or the Society of Architects, the architect in a remote country district exercises his avocation under conditions which are anything but conducive to his material welfare.

He is in all probability badly or imperfectly trained in the technique of his art, and his opportunities of improving his knowledge of design are strictly limited, inasmuch as works of great architectural importance are seldom, if ever, placed in his hands.

An architect of the type we are discussing rarely comes into personal contact with his fellow practitioners, and it is thus impossible for him to benefit by that frank discussion on

topics of professional interest which is often of the greatest value to the young or inexperienced man. The opportunity of substantially improving his position being thus denied to him, it is by no means a matter of surprise that the architectural products of a practitioner enjoying so few facilities for enabling him to make any real advance in his professional education should, often, be of an extremely indifferent nature. In addition, the professional standing of the country architect is becoming more and more insecure, through the ever-increasing competition of the architect of the "semi-tradesman" type. This gentleman's efforts to displace the legitimate practitioner often compel him to supplement his income from extraneous but more profitable sources, such as house and land agencies, valuations, etc. Thus the country architect is often compelled, against his personal inclination and predilection, to leave the narrow and rough paths of architecture, and to follow the wider and smoother high-roads of commercialism.

During the course of conversation with more than one country architect, the writers have been told how impossible it is for the country practitioner to live upon the proceeds of his purely architectural work, and they attribute this unfortunate circumstance to the great want of *esprit de corps* prevalent among the so-called "architects" of their district. A striking example of this absence of professional feeling was given in a recent case in which an employer was able, by the simple process of inviting competitive tenders from architects, to find one who was willing to prepare the working drawings and supervise the erection of a house costing £500 for a fee of thirty shillings! Country architects insist that in such circumstances there is an impelling force which causes them to take up extraneous work, and otherwise adopt practices which they frankly admit are not compatible with the profession of an architect. The gentleman who gave, in public, the information we have quoted, expressed his personal feeling of gratitude to the Institute for having at length seriously taken up the burning question of registration. The general feeling appeared to be that the deplorable want of unity among architects had ruined the art of architecture in this country, and very nearly ruined its practitioners.

During their tour of some twelve hundred miles, by road, the writers had every opportunity of observing the decadence in our domestic and civic architecture, which was constantly apparent.

Unfortunately, the work of the "specialist" seemed to be ubiquitous, and is discernible in almost all the towns and villages which were visited. It was not thus that the designers of the beautiful, unostentatious Georgian buildings, which, fortunately for the art of architecture, are still to be seen side by side with typical examples of the flaunting vulgarity of modern work, were wont to shirk their labour and responsibilities by delegating them to tradesmen and subordinates.

The depths to which modern architecture has sunk are fully proved by this clear evidence of the absence of the master controlling mind of the artist, exhibited in the internal finishings of many recent buildings, and their designers' lack of early training and want of artistic perception are no less indelibly stamped upon the general design of most of the modern structures to be seen in almost any town or village in the kingdom. But whilst no architect of to-day can justly aspire to take rank with the prominent English architects of the eighteenth century, yet increased educational facilities would do much to raise the artistic standard of modern work.

The profession can only be judged as a whole. Individualism is of small account in assessing its artistic standard of merit, and it is only by using registration as a means of instituting a definite and thorough course of practical tuition in the art and science of architecture that the æsthetic tone of the profession will be raised. For this and other reasons, the R.I.B.A. is to be congratulated upon having at length turned its attention to this important subject.

BABYLONIAN ARCHITECTURE.

In an interesting lecture on "The Architecture of Bible Lands," recently delivered by Dr. Theophilus G. Pinches, before the West End Jewish Literary Society, the lecturer, as reported in the "Jewish World," said that, notwithstanding the want of elegance in their great buildings, the Babylonians were born architects. Gudea of Lagas, who lived about 2,500 years before Christ, had at least two statues of himself carved in that character. On his knees rests a board bearing, in one case, a plan of either his capital or his palace, and in the other a rule marked with the scale used, and what is to all appearance the stilus with which the plans were made. If the plan on his knees be that of his palace, the design must have been changed in the course of its erection, for it did not greatly resemble the plan of the building found. It was to be noted that here, as in the case of the plans of the temples, there was the same necessity of passing through rooms to reach the apartment required. This, of course, implied a considerable want of privacy, which was realised by the late occupant of the palace, not on account of having to pass through the rooms, but because of some of the entrances from the courtyard being too exposed. He therefore had blocks of brick-masonry erected before two of the entrances, shapeless masses, it was true, but they served the purpose for which they were erected. Primitive as were Gudea's architectural notions, they were advanced and clever in the extreme compared with those of the builder of these massive screens. But in this palace again, the idea of power inherent in Babylonian and Assyrian buildings came out, as was exemplified by the fourfold brick columns of the buildings as originally erected. Apparently the structure had to support a great weight. But, notwithstanding its massiveness, the way in which the column was constructed was noteworthy, for special bricks were moulded wherewith to form it.

One of the great wonders of Babylon which their forefathers must have seen during the Captivity was the Hanging Gardens. These were said to have been built by Nebuchadnezzar to gratify his Median queen, who, tired of the monotonous Mesopotamian plain, desired something in the nature of the mountains of her native land. These were shown on a slab from Nineveh now in the British Museum. It showed trees growing on a terrace supported on pointed arches, and from the upper part streams of water flow down to water a well-wooded park. At the top, beside the arches, was a temple, with a monolith of a king at the left-hand side, and some little distance from the monolith an altar, with the usual decoration of gradines such as appear bordering the walls of fortified places, etc. As was well known, the Babylonian and Assyrian kings were often regarded as divine, and it was for this reason that offerings were made to them.

Of domestic architecture very little could be said; the middle classes, apparently, had no beautiful or even noteworthy houses, and the lower classes probably lived where they could. The picture of the street in Niffer, unearthed by the American excavations, was very instructive. It would be noticed that it was very narrow, but there was a well-formed gutter to carry off the rainwater down the middle. What the nature of the upper parts of these Babylonian houses were like was not known, but, in all probability, they were sometimes domed. Houses

THE LATE MR. HOWARD COLLS.

with these domed and strange tall conical roofs were said to be usual in the nearer East even now, and, as they knew, the people of Bagdad slept on the flat roofs of their houses in the summer time. The Assyro-Babylonians had not attained to such perfection in architecture as the European nations, but that would probably have come later. They had only to look at some of the sculptures, notably Assurbanipal's lion hunts, to see what they were capable of, and realise that they might have become great architects.

OBITUARY.

Mr. J. Howard Colls.

We deeply regret to announce the death (which took place on Thursday last at Buenos Aires) of Mr. John Howard Colls, the eminent builder and contractor. Mr. Colls, accompanied by his son-in-law, Mr. Nield, has taken a sea voyage for the benefit of his health, and died of heart failure two days before the date fixed for the return journey. He leaves a widow, one son and seven daughters. Mr. J. Howard Colls was a leading partner in the firm of Messrs. George Trollope and Sons and Colls and Sons, Ltd., and had constructed some of the largest and handsomest buildings in London. He was a past President of the National Federation of Building Trades Employers of Great Britain and Ireland, of the Institute of Builders, and of the London Master Builders' Association. His exertions in defending a case of "light and air"—Colls and Sons v. Home and Colonial Stores—which he carried to the House of Lords and won, and which now stands as an historic legal precedent, were so much appreciated by his colleagues in the Institute and Association that they presented him with his portrait in oils, by Mr. W. Q. Orchardson, R.A. He has been characterised as a man of the highest ability, of boundless energy, and extreme geniality.

M. Eugene Boverie.

The death, at the age of 40, has occurred of M. Eugène Boverie, the sculptor. M. Boverie first exhibited at the Salon in 1893, and among his works may be mentioned the well-known bronze statue of Camille Desmoulins, now in the gardens of the Palais Royal.

Mr. Uriah Cummings.

Mr. Uriah Cummings, who died at his home in Stamford, Connecticut, U.S.A., on November 11th, 1910, was prominently identified with the development of the natural cement industry of the United States, giving practical proofs of his firm faith in the material at a time when most people were sceptical upon the subject. He was president of the Cummings Cement Co., of Akron, and an authority on many matters relating to cement and concrete, having for many years had charge of the investigations conducted by the Government of the United States. He was a frequent contributor to the technical magazines and journals, and was the inventor of more than thirty successful mechanical devices. He was born at Akron, New York, in 1833.

Mr. Joseph Pratt.

The death occurred on December 23rd, after an operation, of Mr. Joseph B. Pratt, the mezzotint engraver. Mr. Pratt was born in London in January, 1854, the son of Anthony Pratt, who was also a mezzotint engraver. He was apprenticed in his 15th year to Mr. David Lucas, a noted mezzotint engraver. His best work in his prime was generally considered to have been the preparation of plates from the works of Landseer, Peter Graham, Rosa Bonheur, Briton Riviere, Paton, David Cox, and Heywood Hardy. In later years Mr. Pratt engraved from pictures by Gainsborough, Romney, Hoppner, Raeburn, and Sir Thomas Lawrence, invariably choosing subjects which had not been reproduced by the 18th century engravers.

Mr. Robert Mawson.

Particulars of the career of Mr. Robert Mawson were given in last week's Journal. We now present a portrait of the deceased gentleman, who was a brother of Mr. Thomas H. Mawson, Hon. A.R.I.B.A., much of whose architectural garden designing Mr. Robert Mawson had carried out; the brothers being in this way associated with many of the most beautiful and stately garden designs of modern times. Mr. Robert Mawson died at Windermere on December 15th, at the early age of forty-six.

THE LATE MR. ROBERT MAWSON.

NEW BUILDINGS IN KINGSWAY.

The Holborn-Strand improvement scheme represents London's most notable achievement in town planning. Although it was conceived on utilitarian lines, with, for its chief object, the establishment of through communication between north and south London, the obvious opportunity for dignified building has been by no means neglected. In the present article some of the chief buildings so far erected are illustrated and described.

AS Mr. G. W. Humphreys, M.Inst. C.E., observed in a recent paper read at a meeting of the Institution of Civil Engineers, the London County Council's Holborn-to-Strand improvement not only removed a great cause of congestion of traffic from east to west, but purged the insanitary areas that disgraced a large portion of central London. The scheme comprised also the very remarkable feature of a shallow tramway-subway, which, the first of its kind in England, effected a junction between the tramway systems north and south of the Thames—a connection which had previously seemed to be impossible, owing to the necessary intersection of main arteries of traffic.

The scheme in question, which may be described as the amalgamation of three distinct and separate endeavours, consists, as Mr. Humphreys pointed out, of, first, the widening of the Strand between Wellington Street and the Law Courts; secondly, the construction of a new main thoroughfare, 100 ft. wide and about 3,000 ft. long, from the Strand to Holborn, intersecting the numerous narrow and squalid streets formed in the past according to no recognised scheme of planning; and, thirdly, the widening of Southampton Row in continuation of the new street. There is, further, the construction under the new street of the shallow tramway-subway, and its continuation under the Strand and Wellington Street to the Victoria Embankment, thus enabling tramcars from the northern system to pass through the subway from its egress into Southampton Row near Theobald's Road to the Embankment, and thence, via Blackfriars or Westminster Bridge, on to the southern system.

The whole of the works, both of street- and subway-construction, were, with some slight exception, executed by the London County Council by the direct employment of labour through its late Works Department, of which Mr. Humphreys was chief, and to the designs of and under the general supervision of Mr. Maurice Fitzmaurice, the London County Council's Chief Engineer.

The formation of the new street calls for little comment, save for the fact that the work had to be spread over some time, and a great deal had to be carried out in crowded thoroughfares. In connection with the formation of the street, however, the electric-power, gas-, water-, and other mains and pipes had to be carefully preserved, with a view to their reception in the subways formed beneath the new thoroughfare, and the diversion of old and the construction of new sewers formed also an important part of the undertaking. It is noteworthy that during the progress of the work practically no interruption to vehicular traffic was caused, nor was diversion of traffic necessitated, particular care being taken to provide access for vehicular traffic on the main roadways affected by the improvement.

The main portion of the subway was constructed in "cut-and-cover," but the portions under Holborn and under the Strand and Wellington Street were constructed by means of a shield. The portion of the undertaking which called for the greatest care was the

subway under Wellington Street, a thoroughfare found to be constructed on brick arches, the piers of which had to be cut at varying angles to admit of the formation of the subway. The normal roofing of the subway is steel troughing, a bricked arched roof being substituted in the deeper portions; the walls are composed of Portland-cement concrete with an envelope of $\frac{3}{4}$ inch of mastic asphalt embedded in the concrete. A double line of tram-rails is laid in the subway, and two stations, the entrances to which are utilised also as street-refuges in Kingsway, afford means of access to the tramways.

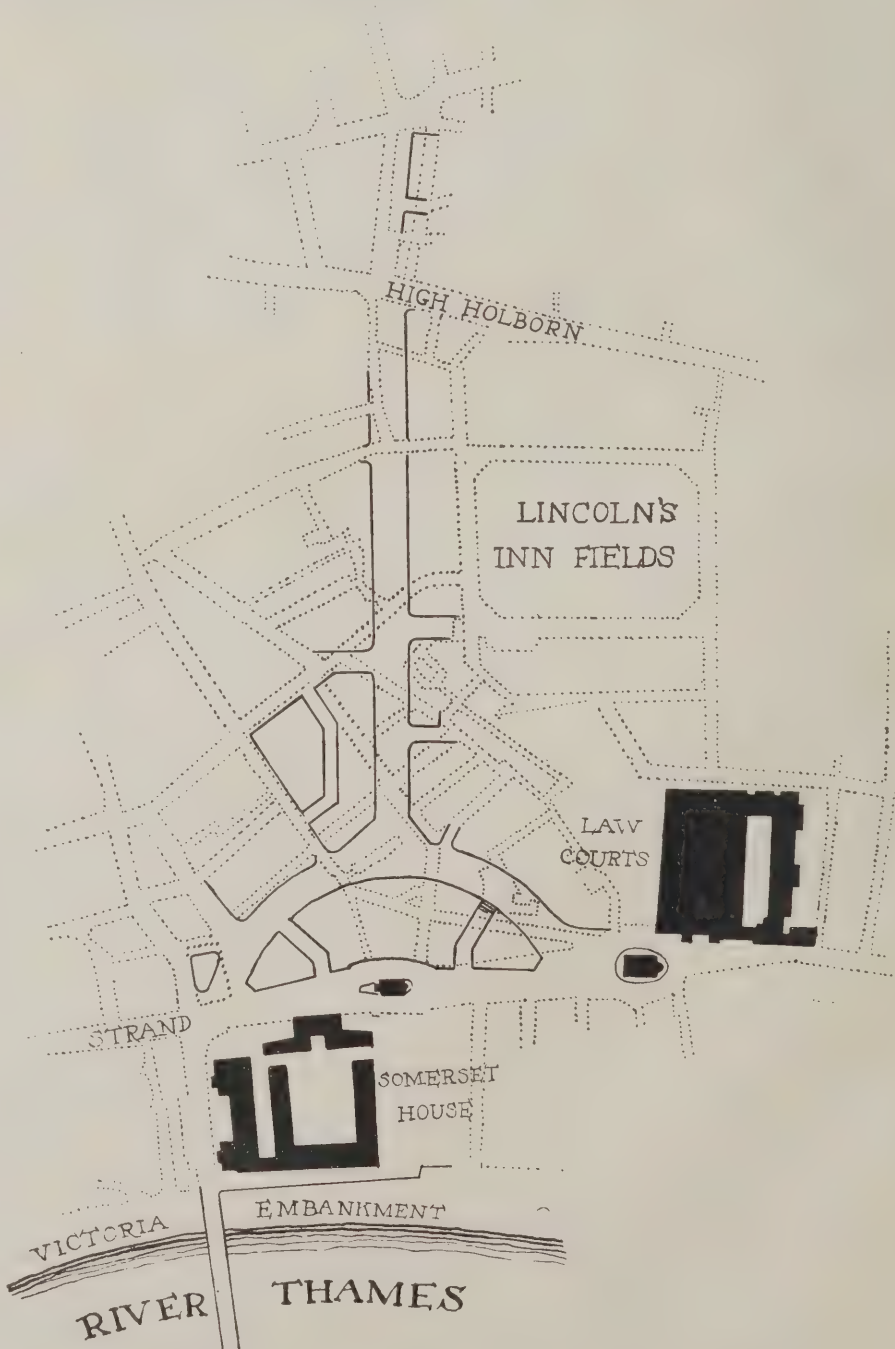

The magnitude of the undertaking may be judged by the fact that the gross cost is approximately £6,078,324, of which £385,041 was for works, which were

executed well within the limit of the estimates of the Council's officers.

Kingsway will, no doubt, soon be one of the show places of the metropolis—a wide street of handsome buildings, conspicuous among them being

Koh-i-Noor House,

the home of the Koh-i-Noor pencil and Waterman's Ideal fountain pen. The ground storey comprises a shop level and a mezzanine contained in six lofty openings or bays, with bold semicircular arches surmounted by a flat cornice running the width of the building; the wall spaces are rusticated in treatment. There are two entrances, one in Kemble Street for merchandise and the upper floors, through a rusticated doorway, and the other, the principal one, at the corner of the two streets. This latter entrance is a portico, flanked by two columns having plain shafts and capitals of modern composite detail. These shafts support an entablature bearing a balcony, having on its front face decorated scroll work exhibiting the name of the

PLAN SHOWING THE LAY-OUT OF KINGSWAY AND ALDWYCH.

house, carved, amid cherubs and artists' material, all in low relief.

In the recess above, reaching to the mezzanine cornice and supporting it at this point, are two marine figures—a mermaid and merman—surrounding the window opening. These figures and the decorative details are from the chisel of Mr. Gilbert Seale. The attic storey is varied with truss-shaped chimney stacks, and the whole building is surmounted by a high-pitched roof of concrete and steel, covered with grey slates, showing a row of dormer windows. The architectural features of the building culminate in a cupola immediately above the angle of the corner of the two streets, an elegant structure composed of four groups of engaged columns, supporting a dome partially gilt, each group, above frieze, terminating in an urn. The elevation of the building is further enriched with three metal railed balconies on the first floor level. The ground level will be used as a shop and stock rooms, and have been beautifully fitted up for this purpose in oak panelling, etc. The basements will be used for packing and despatching goods; the offices for the various departments of this extensive business, such as export, etc., are located in the floors above, where also the offices of the National Federation of Master Builders, the London Master Builders' Association, etc., are concentrated. Messrs. J. S. Gibson, Skipworth and Gordon, Old Bond Street, W., are the architects.

Holy Trinity Church.

Considerable progress has been made with the erection of the new Church of the Holy Trinity in Kingsway, of which the foundation stone was laid on October 27 by Lady Mary Glyn, and it is expected that the building will be completed in less than a year. The old church, which was built in 1831 and restored in 1887, had been rendered unsafe by certain excavations which had been made in the neighbourhood, and it was found necessary to demolish it. This is one of the few examples of church rebuilding in the centre of London in recent years. The City churches of London are generally of one type, having been, for the most part, re-erected by Sir Christopher Wren after the Great Fire. The new Church of the Holy Trinity will resemble Wren's buildings. The architect, Mr. John Belcher, R.A., has designed a tower, which will be in harmony with those of St. Mary-le-Strand and St. Clement Danes at the other end of Kingsway. The architect's drawing was exhibited in last year's Academy. Holy Trinity Church will have a recessed curved front facing into Kingsway. Here, at the east end, will be the main entrance, surrounded by the tower; the altar will be placed at the west end. The chancel will be octagonal in form, and will contain oak choir stalls, screen, and pulpit. The body of the church will be of reinforced concrete, but the front and tower will be faced with Portland stone. The main roof will

"KOH-I-NOOR HOUSE," KINGSWAY. GIBSON, SKIPWORTH AND GORDON, ARCHITECTS.

be semicircular in form, and so will the roofs of the north and south transepts. The roof and tower will be supported on fourteen piers of ferro-concrete, with brick walls between. The open tower will have three stages. There will be balconies in the two lower ones, and the upper one will be constructed for a peal of bells. The church will afford seating capacity for 750 people; its length will be 140 ft., and its width 75 ft. The height of the tower will be 200 ft. Beneath the church a large hall will be provided, and there will also be accommodation for a boys' club, with a recreation room and a miniature rifle range. The cost of the church is estimated

at £11,000, apart from the tower, which will entail a further expenditure of about £5,000.

The London Opera House.

The foundations of the new opera-house which is to be built at a cost of £150,000 in Kingsway, for Mr. Oscar Hammerstein, are now nearing completion, and it is expected that the building will be finished in less than a year. Mr. Bertie Crewe's design shows that the exterior has for its main feature a row of coupled pilasters of Greek Corinthian design, resting on a heavily rusticated base of Portland stone. The building will cover an area of 25,000 superficial ft., and have a frontage to

CROSS-SECTION SHOWING SUBWAYS UNDER KINGSWAY.

"LINCOLN'S INN HOUSE," KINGSWAY.
E. L. LUTYENS, F.R.I.B.A., ARCHITECT.

Kingsway of 260 ft. in length. At each end the sky-line will be broken by groups of statuary.

The interior of the Opera House will be decorated in the French Renaissance style. There will be no columns or stanchions to obstruct the view of the stage, as the cantilever system will be adopted. A tier of boxes will be suspended from beneath the circle, and above this will be one of the largest galleries in any London theatre. There will be a special entrance for Royalty in Kingsway, leading to the suite of retiring rooms reserved for the King. The stage is to be 90 ft. wide and 60 ft. deep. The Opera House is designed to accommodate over 3,000 people.

"Lincoln's Inn House."

This is another notable addition to Kingsway. It is on the eastern side of the thoroughfare. The façade is carried out in Portland stone, and exhibits the hand of a very cultured architect, Mr. E. L. Lutyens, F.R.I.B.A., who here combines the distinguishing qualities of some American buildings of this type with the individual character expressed with great skill in his many domestic buildings. The

building is intended for business purposes, and comprises a large room—for shop, bank, or other purposes—on the ground floor, a finely panelled large room above, and numerous suites of offices. Over the entrances are some delightful children's heads as keystones, very skillfully carved by Mr. Broadbent.

Another large new building on Kingsway is that nearly opposite "Lincoln's Inn House," and occupied largely by the International Correspondence Schools. It was designed by Messrs. Gordon and Gunton, F.R.I.B.A.

On the same side—the western side—is a tall building at the southern end of Kingsway, occupied by Messrs. W. H. Smith and Son; while at the northern end, next the new Trinity Church, is the block of business premises illustrated on page 14 of this issue, designed by Mr. Henry Tanner, junr.

On the curved arm of the new street, Aldwych, which leads right and left into the Strand, several new buildings have been erected, though, like Kingsway itself, the thoroughfare is far from complete. On the western side the new Gaiety Theatre and Restaurant (of which Messrs. Ernest Runtz and Ford and Mr. Norman Shaw were the joint architects) is faced by the new "Morning Post" offices (Messrs. Mewès and Davis, architects)

and the Waldorf Hotel (Messrs. A. Marshall Mackenzie, architects), flanked by the Aldwych and Strand Theatres (Mr. W. G. R. Sprague, architect); on the centre portion of the "island" site it is expected that the new Palace of French Arts and Industries will arise from the designs of M. Gerard; while on the eastern arm a fine new building is now being completed for an insurance company from designs by Messrs. J. J. Burnet, A.R.S.A., F.R.I.B.A., and Son.

Church of SS. Anselm and Cecilia.

This church takes the place of that which was long known as the Sardinian Chapel, Lincoln's Inn Fields, the latter having been acquired by the London County Council in connection with the formation of Kingsway. There was a tradition that the old church was designed by Inigo Jones, who did so much other work in the vicinity; but having been completely wrecked during the Gordon riots, and afterwards restored at the expense of the Government in apparently as cheap a way as possible, the building bore no trace of any architectural character that could be attributed to Inigo Jones. It was, however, the oldest post-Reformation Catholic Church place of worship in London, and existed under the protection of the Sardinian Ambassador until such help was no longer required.

DETAIL OF ENTRANCE TO "LINCOLN'S INN HOUSE," KINGSWAY.

The new church is designed in Early Renaissance style (as being most in accordance with its traditions), and consists of a nave and chancel with one wide aisle on the south side, the sacristies being beneath the chancel. The roofs are all of unvarnished pitch-pine, that to the nave being of barrel form, divided at each bay by large arched ribs resting on stone wall shafts with carved capitals. A lofty arch divides the nave from the chancel, the carved capitals being studied from those in the chapel built by Sir Thomas More at Chelsea church, while the arched stone rood-loft is on a small scale arranged somewhat in the manner of that in the

Blessed Virgin under a richly-carved canopy, having on either side figures of St. Anselm and St. Cecilia in niches with tall carved canopies. The whole is surmounted by a carved and moulded cornice from which is supported the back portion of the baldacchino, the front being supported from the ceiling. The altar rail and any furniture from the old church fit for removal were refixed in the new one, the old altar being placed at the end of the south aisle, and the font at the west end. A clergy-house for three priests has been erected at the rear of the church to take the place of the old one in Lincoln's Inn Fields.

PRESENTATION TO MR. JOHN SLATER, F.R.I.B.A.

The Council of the R.I.B.A., as an expression of personal regard for their former colleague, Mr. John Slater, and of appreciation of his many years' service as a member of their body, have presented him with a pair of handsome silver loving-cups. Mr. Slater has been a Fellow of the Institute for nearly thirty years, and was for twenty-five years a member of the Council. He retired from the latter position at the end of last Session, to the regret of his colleagues on the Council and of the very

BUSINESS PREMISES ON WEST SIDE OF KINGSWAY. GORDON AND GUNTON, F.R.I.B.A., ARCHITECTS.

church of St. Etienne du Mont, Paris. The chancel is paved with black and white marble, and the whole of the east end is filled by the high altar, with its reredos and carved and gilded baldacchino. The altar and retablo are detached from the wall, the former having a moulded black marble base with square carved pillars supporting the mensa in the style of those of Torregiano's altar in Henry VII.'s chapel in Westminster Abbey. The reredos is almost plain in the lower part, save for two panels carved with instruments of the Passion. Above, the central portion is occupied by a sculptured group of the Coronation of the

The church seats about 500 persons, and, together with altar, etc., and the clergy-residence at the rear, has cost about £12,500. Externally it is faced with Portland stone, while internally Bath stone has been freely used. Mr. Frederick A. Walters, F.S.A., of Old Queen Street, Westminster, was the architect, and Messrs. James Smith and Sons, Ltd., of South Norwood, were the contractors. The altar and reredos, with all other carving, were carried out by Messrs. Earp and Hobbs, of Lambeth. The metal casements and leaded glazing were executed by Messrs. R. E. Pearse and Co., Ltd., of Upper Kennington Lane, London.

large number of outside members to whom his invaluable services to the Institute in various capacities had been known and appreciated.

Mr. Slater has taken part in practically all the numerous activities of the Institute since he first joined as Associate in 1879. He has served on most of its committees: the Science Committee, the old Library Management Committee, the Light and Air Committee, the Competitions Committee, the Board of Professional Defence, the Prizes and Studentships Committee, the Finance Committee, of which he was for many years chairman,

and various special committees. His knowledge and experience have always been at the service of the Council in the settlement of questions from time to time referred to them.

In a paper on "Building Legislation," read before the Institute some years before the London County Council took the matter in hand, he advocated the codification of the various Buildings Acts relating to London, and the passing of a measure which should lead to better building both from a constructional and a sanitary point of view. Many of his proposals found place in the subsequent Act of 1894. For several years he has been a member of the Tribunal of Appeal under the London Building Act, holding the appointment from the Council of the Institute. Mr. Slater, with the late Mr. Arthur Cates, has had a large share in the initiation and carrying forward of the educational work of the Institute, notably the scheme of progressive examinations. He was a member of the old Board of Examiners from the year 1882 until its supersession in the past year by the present Board of Architectural Education, serving for many years as vice-chairman and afterwards as chairman, and rarely missing a meeting. When the Board of Architectural Education was initiated in 1904 he acted as joint Hon. Secretary, with Professor Reginald Blomfield, A.R.A., and helped to draw up the scheme of education which has since been adopted in the principal institutions of architectural training throughout the country.

Mr. Slater still retains his position on the Board, and at the last examination was to be seen, as for so many years past, taking his turn in presiding at the *viva voce* examination of candidates. Mr. Slater represented the Institute on the Lightning Research Committee (1901-1905), and acted as its chairman during the five years of a peculiarly difficult and laborious investigation. His linguistic attainments have often served the Institute in good stead, especially in the entertainment of foreign guests and as representative of the Institute on Congresses abroad. He is one of the Institute's best speakers, and few members are more regular in attendance at the general meetings of the Institute.

NOTES FROM DUBLIN.

Sir Joseph Downes, J.P., T.C., merchant baker, Nos. 5 and 6, North Earl Street, having purchased the premises adjoining his own shops, is about to spend between four and five thousand pounds on re-building. The architect is Mr. Geo. T. Moore, M.Inst.C.E.I., 1 and 2, Foster Place, and the quantities are being taken out by Mr. James Mackey, J.P., surveyor, of 58, Dame Street.

A new Roman Catholic college for the Jesuit fathers, for students in connection with the national university, is proposed to be built in Hatch Street. The cost of the shell of the building will be some £16,000. Mr. Francis Bergin, B.E., Westmoreland Street, has prepared one set of designs, and the quantities were taken out by Mr. Mackey, surveyor. Mr. Chas. B. Powell, Rathmines, has got out another set of drawings, the quantities for which were issued by Messrs. Mumby and O'Rourke, surveyors, College Green.

Messrs. Manfield and Sons, boot and shoe manufacturers, Sackville Street, have taken over the large corner premises, 44, Sackville Street and Abbey Street, and will immediately proceed with re-building and structural improvements.

P. T.

NEWS ITEMS.

Church of St. John the Baptist, Holland Road, Kensington.

Messrs. E. A. Roome and Co., of 36, Basinghall Street, E.C., were the builders of the additions to this church referred to on page 666 of our issue for December 28th.

* * *

A Tinworth Exhibition.

A series of sketches in terra-cotta and other examples of the work of Mr. George Tinworth, sculptor, will be on exhibition in the Cuming Museum, at the Southwark Central Library, Walworth Road, S.E., for a few weeks. Admission is free.

* * *

Notice of Removal.

The offices of Mr. Charles R. Price (late S. J. Scott), builder and contractor, have been removed from 139, Bishopsgate Street Without to 87, Bishopsgate, E.C. Additional premises have been taken in Bishopsgate Avenue to increase the facility for dealing with the City work. Telegraphic address and telephone numbers remain as before. (Telephone: Head Office, 2565 London Wall; Works, 224 Dalston. Telegrams, Priconia, London.)

The Buried City of Meroe.

Mr. J. Garstang has recommenced excavations at the buried city of Meroe on the Nile. He has discovered a palace, a bath room in perfect preservation, the walls of an acropolis, quays, and a harbour. A bronze head with inlaid eyes, larger than life—an excellent piece of Greek art—was also unearthed.

* * *

The Architectural Association.

There seems to have been some curiosity as to what was intended by the title of Mr. Statham's paper to be read at the meeting on the 9th, "Architecture as plan and section." The meaning will perhaps be clearer by the title under which the paper will actually be given—"Architecture considered as plan and section," i.e., in its general conception, apart from any question of details of style. The main object of the paper is to suggest a way of escape from "The battle of the styles."

* * *

Builders' Clerks' Benevolent Institution.

A special general meeting for the election of three pensioners was held on Tuesday, 20th December last, William Downs, Esq., President, in the chair. At the declaration of the poll the result was as follows:—Mr. Soper, 914 votes; Mrs. Thompson, 761 votes; Mr. Stratton, 723 votes; Mrs. Hawkins, 567 votes.

The three highest on the list were duly elected. Mrs. Hawkins, widow, was receiving half her late husband's pension, and she having been unsuccessful at three elections, it was proposed and unanimously agreed that the full pension of a widow should be granted her, the Committee feeling that the donors and subscribers would endorse their action, the additional cost to the funds of the Institution being £9 per annum.

New Cure for Damp Walls.

A new method of drying humid walls, devised by a Belgian architect, M. Knapen, consists in embedding inclined porous tubes in the walls, the direction of the tubes in plan being perpendicular to the wall surfaces. By capillary action these tubes continually absorb the moisture from the wall, for the air which they contain, being in the same hygrometric

condition as that of the interior of the building, is relatively dry, and readily takes up moisture. The act of vaporisation ensuing therefrom reduces the temperature of the air passing from the tube and being constantly replaced by drier and warmer air. The tubes are placed sufficiently close together to leave no intervals between their zones of influence. In new buildings the places for the tubes are left, but the tubes themselves are not inserted until the mortar has set. It is stated that the method has been tried at Versailles.

COMPETITIONS

Ruislip Manor.

Premiums of £150, £100, and £50 were offered to architects and surveyors for the laying out of the Ruislip Manor Estate; the author of the first premiated design to be appointed to supervise the carrying out of the work as architect to the promoting company, on terms agreed by the R.A.B.A. Sixty-two designs were submitted to the assessors, Sir Aston Webb, C.B., R.A., and Mr. Raymond Unwin, F.R.I.B.A., whose award is now announced, as follows: 1, A. and J. Soutar, 37, Westover Road, Wandsworth, S.W.; 2, George Hornblower, 2, Devonshire Terrace, W.; 3, H. R. Gardner, Reigate Road, Leatherhead. The successful competitors have had exceptional experience in this branch of their profession, having been engaged for the past ten years under Mr. W. E. Kiley, F.R.I.B.A., on the development of the various large housing estates of the London County Council. They have also won three first premiums in three similar competitions. Further particulars are reserved for next week's issue.

LIST OF COMPETITIONS OPEN.

JAN. 21. SCHOOL FOR TAUNTON.—The Education Committee of the Borough of Taunton invite architects practising in that borough to submit designs for a provided school for 440 children. No premium is offered, but the author of the selected design may carry out the work at the commission of 5 per cent. Address George H. Kite, Town Clerk, Municipal Buildings, Taunton.

JAN. 31. GLASGOW PUBLIC LIBRARY.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Saracen Street and Allander Street, Possilpark. Premiums of £50, £30, and £25 respectively will be awarded to the authors of the designs adjudicated first, second, and third in order of merit. Designs must be lodged on or before Tuesday, January 31. Particulars from A. W. Myles, Town Clerk, City Chambers, Glasgow.

FEB. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK.—Particulars in our issue for October 12.

MARCH 1. MUNICIPAL OFFICES, COVENTRY.—This competition is open to all architects, and the assessor is Mr. E. Guy Dawber. Particulars (on receipt of two guineas) from Geo. Sutton, Town Clerk, 10, Hay Lane, Coventry. See our issue for November 23.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 26.

JUNE 10. SEWERAGE SCHEME, ASPATRIA, CUMBERLAND, U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

LOCAL GOVERNMENT BOARD REPORT.

The second part of the Report of the Local Government Board (Cd. 5275), which was issued on December 21st, deals with the administration of county, municipal, district, and parish councils, with the public health, local taxation, and valuation. The first part, which relates to the administration of the Poor Laws, the Unemployed Workmen Act, 1905, and the Old-Age Pensions Act, 1908, was issued three months ago.

Maintenance of Roads.

Next to elementary education, the largest separate item in the accounts of county councils other than the London County Council in 1908-9 was in respect of main roads. The sum directly or indirectly paid by county councils in respect of 27,749 miles of such roads amounted to £2,739,591. The expenditure on roads other than main roads included £2,160,492 spent by rural district councils on maintenance and repairs, and £52,067 spent on improvements. In addition £16,085 was spent out of borrowed moneys on roads of the same class. The total length of these roads was 95,144 miles. A feature of administrative importance to which attention is drawn in the report is the Development and Road Improvement Act, 1909, under which the Road Board constituted under the Act is empowered, with the approval of the Treasury, to make advances by way of

grant or loan to county councils and other highway authorities in respect of the construction of new roads or the improvement of existing roads, and to construct and maintain new roads. Any new road constructed by the Road Board will be a public highway, but it will be maintained by and at the cost of the Road Board. For this purpose a Parliamentary grant will be available. It may be assumed from the foregoing that there will in the near future be a considerable further increase in the cost of maintaining, repairing, and improving the main roads of the country. Probably this increase will be put down to the development of motor traffic in this country.

Loans to Urban and Rural District Councils.

During the year 1909 loans to the amount of £6,252,889 were sanctioned by the Board on the application of urban and rural district councils. Urban councils are responsible for £5,700,432 of that sum, £2,100,119 being for sewerage and sewage disposal; £1,257,457 for street improvements, making up private streets and construction of new streets and bridges; whilst £464,877 was sanctioned on account of waterworks in urban districts.

Housing.

Important advances have been made during the year towards the provision of improved housing for the working classes and for others. The Housing, Town Planning, etc., Act., 1909, is not, like its predecessors, limited mainly to the wants of the labouring or even the working

class population. The early Acts dealing with the subject were known as the Artisans and Labourers' Dwellings Acts. They were replaced by the Housing of the Working Classes Acts. Now we have reached a third stage, in which local authorities are empowered to provide and supervise houses of a better class than under the former enactments, and to regulate more effectually the planning of all classes of dwelling-houses in urban areas. "The object of the town-planning part of the Act is to ensure, by means of schemes which may be prepared either by local authorities or landowners, that, in future, land in the vicinity of towns shall be developed in such a way as to secure proper sanitary conditions, amenity, and convenience in connection with the laying out of the land itself and of any neighbouring land."

It is a noticeable feature of the new Act, and one to which the report draws special attention, that it applies, to houses of much higher rental, those provisions of the Act of 1890 which imply a condition in the contract for letting that the house is fit for habitation, and includes in the implication a condition that during the tenancy the landlord shall keep the house in a state reasonably fit for habitation. The passing of the new Act has greatly increased the work of the Department.

Water Supply of London.

The report contains the usual particulars relating to the water supply of London. Year by year the amount of water consumed in the area supplied by the Metropolitan Water Board shows a considerable increase. In the year 1909 the average number of people supplied was 7,064,013, or about 30,000 more than in 1908. The total average daily supply in 1908 and 1909 respectively was 223,777,747 and 226,481,907 gallons, the average daily consumption per head being 31.98 gallons per head in 1908 and 32.06 gallons per head in 1909.

The water is obtained from the rivers Thames and Lea, from gravel beds in the Thames valley, from springs in the Lea valley, and from 52 wells. The reports of the Board have for many years past drawn attention to the necessity of providing additional storage accommodation for water supply purposes, and it is satisfactory to learn that great progress has been and is being made in this direction.

During the year 1909 no fewer than 13,888 samples of water were examined in the Water Board's laboratories, mostly by bacteriological methods. The results are briefly summarised in the appendix to the report under review, which also gives an interesting résumé of Dr. Houston's report to the Water Board on his experiments to determine the effect of storage on the life of cholera germs artificially introduced into samples of various kinds of water. In the Board's report for 1908 similar information was supplied as to the effect of storage on typhoid germs. The result is said to form another link in the chain of evidence which Dr. Houston has sought to establish, namely, "That by adequately storing the raw impure river waters which constitute the chief sources of London's water supply, antecedent to their filtration, safety of the metropolis as regards water-borne epidemic disease (apart from the possibility of accidental infection of the works, or subsequently in the pipes) is almost, if not quite, assured." The loans sanctioned on the application of the Metropolitan Water Board during the year 1909 amounted to £69,961, as compared with £722,393 sanctioned in the previous year.

CHURCH OF SS. ANSELM AND CECILIA, KINGSWAY, LONDON: VIEW LOOKING EAST, TOWARDS ALTAR AND REREDOS.

R.I.B.A. : NEW REGULATIONS FOR COMPETITIONS.

The R.I.B.A. Regulations for Architectural Competitions, revised and amended in accordance with the resolutions passed by the general body at the meeting of the 21st November, have now been issued as an Institute paper and the old regulations withdrawn.

The new regulations are as follows :—

It is assumed that the object of the promoters is to obtain the best design for the purpose in view. This object may best be secured by conducting all Competitions upon the lines laid down in the following regulations, which have been framed with a view to securing the best results to the promoters with scrupulous fairness to the competitors.

and that the drawings have been prepared under his or their own supervision. A successful competitor must be prepared to satisfy the assessor that he is the bona-fide author of the design he has submitted.

- (D) The premiums shall be paid in accordance with the assessor's award, and the author of the design placed first by the assessor shall be employed to carry out the work, unless the assessor shall be satisfied that there is some valid objection to such employment, in which case the author of the design placed next in order of merit shall be employed, subject to a similar condition. The award of the assessor shall not be set aside for any other reason.
- (E) If no instructions are given to the author of the design selected by the assessor to proceed within twelve months

made with the greatest possible care, as the successful result of the competition will depend very largely upon his experience and ability.

The President of the Royal Institute of British Architects is always prepared to act as honorary adviser to promoters in their appointment of assessors.

2.—The duties of an assessor are as follows :—

- (a) To confer with and advise the promoters on their requirements and on the questions of cost and premiums to be offered.
- (b) To draw up instructions for the guidance of competitors and for the conduct of the competition, incorporating the whole of the clauses of these regulations which are applicable to the particular competition.

CRAVEN HOUSE, KINGSWAY, LONDON. H. TANNER, JUNR., F.R.I.B.A., ARCHITECT.

Members of the Royal Institute of British Architects and Allied Societies do not compete excepting under conditions based on these regulations.

The conditions of a competition shall contain the following regulations (A) to (F) as essential :—

- (A) There shall be appointed for every competition one or more fully qualified professional assessors, to whom the whole of the designs shall be submitted.
- (B) No promoter of a competition, and no assessor engaged upon it, nor any employee of either, shall compete, or assist a competitor, or act as Architect, or joint architect, for the proposed work.
- (C) Each design shall be accompanied by a declaration, signed by the competitor, or joint competitors, stating that the design is his or their own personal work,

from the date of the award, then he shall receive payment for his services in connection with the preparation of the competition drawings of a sum equal to $1\frac{1}{4}$ per cent. on the amount of the estimated cost. If the work is subsequently proceeded with, the $1\frac{1}{4}$ per cent. previously paid to him shall form part of his ultimate commission.

- (F) The selected architect shall be paid in accordance with the schedule of charges sanctioned and published by the Royal Institute of British Architects.

1.—The promoters of an intended competition should, as their first step, appoint one or more professional assessors, architects of established reputation, whose appointment should be published in the original advertisements and instructions. The selection of an assessor should be

Note.—It is essential in drawing up the instructions to state definitely which of the conditions must be strictly adhered to, under penalty of disqualification from the competition, and which of them are optional.

- (c) To answer queries raised by competitors within a limited time during the preparation of the designs, such answers to be sent to all competitors.
- (d) To examine all the designs submitted by competitors, and to determine whether they conform to the conditions and to exclude any which do not.
- (e) To report to the promoters on the designs not so excluded and to award the premiums in strict adherence to the conditions.

3.—Competitions may be conducted in one of the following ways:—

(a) By advertisement, inviting architects willing to compete for the intended work to send in designs. For competitions for public works of great architectural importance this method is recommended.

(b) By advertisement, inviting architects willing to compete for the intended work to send in their names by a given day, with such other information as they may think likely to advance their claims to be admitted to the competition. From these names the promoters, with the advice of the assessor, shall select a limited number to compete, and each competitor thus selected shall receive a specified sum for the preparation of his design.

(c) By personal invitation to a limited number of selected architects to join in a competition for the intended work. Each competitor shall receive a specified sum for the preparation of his design.

Note.—Where a deposit is required for supplying the instructions it shall be returned on the receipt of a bona-fide design, or if the applicant declines to compete and returns the said instructions within a month after the receipt of replies to competitors' questions.

4.—The number, scale, and method of finishing of the required drawings shall be distinctly set forth. The drawings shall not be more in number, nor to a larger scale than necessary to clearly explain the design, and such drawings shall be uniform in size, number, mode of colouring and mounting. As a general rule a scale of 16ft. to 1in. will be found sufficient for plans, sections, and elevations, or in the case of very large buildings a smaller scale might suffice.

Unless the assessor advises that perspective drawings are desirable, they shall not be admitted.

5.—No design shall bear any motto or distinguishing mark; but all designs shall be numbered by the promoters in order of receipt.

6.—A design shall be excluded from a competition—

(a) If sent in after the period named (accidents in transit excepted);

(b) If it does not give substantially the accommodation asked for;

(c) If it exceeds the limits of site as shown on the plan issued by the promoters, the figured dimensions on which shall be adhered to;

(d) If the assessor shall determine that its probable cost will exceed by 10 per cent. the outlay stated in the instructions, or the estimate of the competitor, should no outlay be stated. If the assessor be of opinion that the outlay stated in the instructions is inadequate, he shall not be bound in the selection of a design by the amount named in such instructions, but the question of cost shall nevertheless be a material element in the consideration of the award;

(e) If any of the conditions or instructions other than those of a suggestive character are violated;

(f) If a competitor shall disclose his identity or attempt to influence the decision.

7.—All designs and reports submitted in a competition for a public building, except any excluded under Clause 6, shall be publicly exhibited after the award has been made, which award shall be published at the time of exhibition; and all designs

and reports submitted in a competition for a private building shall be similarly exhibited to the competitors.

8.—All drawings submitted in a competition, except those of the design selected to be carried out, shall be returned to the competitors.

The usual R.I.B.A. scale of charges for assessing competitions, whether by jury or otherwise, is the sum of thirty guineas, plus one-fifth per cent. upon the estimated cost of the proposed building.

The regulations are not intended to apply to small, limited private competitions.

THE R.I.B.A. NOVEMBER EXAMINATIONS.

The Preliminary.

The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., was held in London and the provincial centres mentioned below on the 14 and 15 November. Of the 125 candidates admitted, claims for exemption from sitting were allowed to the number of thirty, and the remaining ninety-five candidates were examined with the following results:—

Centre.	Total Exam'd.	Passed.	Relegated.
London	41	26	15
Birmingham	5	5	0
Bristol	8	4	4
Cardiff	6	4	2
Leeds	9	7	2
Manchester	22	9	13
Newcastle	4	4	0
	95	59	36

The Intermediate.

The Intermediate Examination, qualifying for candidature as Student R.I.B.A., was held in London and the under-mentioned provincial centres on the 14th, 15th, 17th, and 18th November, when 107 candidates were examined, with the following results:—

Centre.	Total Exam'd.	Passed.	Relegated.
London	72	34	38
Bristol	5	1	4
Cardiff	3	1	2
Leeds	7	4	3
Manchester	18	5	13
Newcastle	2	1	1
	107	46	61

The Final and Special.

The Final and Special Examinations were held in London from the 24th November to the 2nd December. Of the 122 candidates examined, 54 passed, and 68 were relegated in various subjects. The following are the names of the passed candidates, the † prefixed to a name signifying that the candidate entered for the Special Examination, which is designed for architects in practice and chief assistants exempted by the Council from the Preliminary and Intermediate Examinations and from submitting Testimonies of Study:—

(The initial s.=student.)

Adam, Alexander (s. 1907), Paisley; Arnott, Charles Dudley (s. 1906), Gorleston-on-Sea; Barnish, Leonard (s. 1903), Blundellsands; Beswick, William (s. 1908), Chester; Birkett, Stanley (s. 1905), West Didsbury, Manchester; Bunce, Henry Edgar (s. 1908), London, N.E.; Butt, Charles Frederick (s. 1908), London, W.; Carter, George Ralph (s. 1908), Leicester; Chaundler, James Hubert (s. 1905), London, S.W.; Cloux, Frank Louis Whitmarsh (s. 1906), Brixton, S.W.; Coates, William Victor (s. 1908), Grimsby; Coqk-

rill, Kenneth Arthur (s. 1908), Gorleston; †Collins, Alfred Francis (special), Windsor; †Coombs, Leslie Douglas (special), Bowling Street, Dunedin, New Zealand; Cranford, William Harold (s. 1907), Finsbury Park, N.; Davis, Philip Wolf (s. 1907), London, W.; †Drysdale, George (special), Strand, W.C.; Evans, Thomas Glynne (s. 1908), Liverpool; †Glanfield, Ernest Budge (special), Bond Street, W.; Hall, Edwin Stanley (s. 1907), Bedford Square, W.C.; †Hathaway, Percy William (special), Rochdale; Hett, Leonard Keir (s. 1909), Hampstead, N.W.; Higgins, William Thomas (s. 1906), Stony Stratford, Bucks; Hodges, Claude Vivian (s. 1905), Leicester; Hughes, Thomas Harold (s. 1909), Aberdeen; Hulbert, Francis Seymour (s. 1909), London, S.W.; Jones, Cyril Montagu (s. 1906), London, W.C.; Kipps, Percy Kingsford (s. 1906), Lewisham, S.E.; Lodge, Thomas Arthur (s. 1909), Thames Ditton, Surrey; Lyon, Maurice (s. 1907), Edenbridge, Kent; Mansfield, Leslie (s. 1908), Bickley, Kent; Martin, John Gray (s. 1906), Oldham; Matheson, Kenneth William (s. 1904), Clapton, N.E.; Matthews, Bernard Frank (s. 1909), Stockwell, S.W.; Moore, Ernest Josiah Edwards (s. 1906), Newport, N.W.; Munt, Francis Edwin Spencer (s. 1906), Balham, S.W.; †Peascod, Joseph (special), London, E.; Pywell, William Jackson (s. 1907), Brighton; Robertson, Norris Bathgate (s. 1908), Leicester; Schofield, John Frank (s. 1905), London, E.; Shanks, Norman Fraser (s. 1907), Old Trafford, Manchester; Slater, John Alan (s. 1908), London, N.W.; Smith, Frank William (s. 1908), Newark-on-Trent; Sutton, Cecil Alfred Leonard (s. 1909), Nottingham; Tanner, Edwin John (s. 1909), London, W.; †Thompson, Charles William Ward (special), Chatham; †Tugwell, Sydney (special), Bournemouth; Walker, Marshall Eyre (s. 1907), Woking; Welch, Herbert Arthur (s. 1907), Hendon, N.W.; †Wellburn, George Taylor (special), Redcar, Yorks; Wheatley, Joseph Horace Lynchem (s. 1906), Petersfield; Wilson, Herbert John (s. 1905), Accrington; Winch, Arthur (s. 1909), Leeds; Wright, Edward Leslie (s. 1906), Cardiff.

The following table shows the number of failures among the relegated candidates in each subject of the Final Examination:—

I. Design	46
II. The Principles of Architecture	43
III. Building Materials	9
IV. Principles of Hygiene	27
V. Specifications	14
VI. Construction: Foundations, etc.	36
VII. Construction: Iron and Steel, etc.	39

Street Lighting in Liverpool.

The success of the experimental system of automatic street lighting in Liverpool has led to its extension, and its use promises to become universal in that city. It was feared that owing to the varying temperature and the heavy street traffic the number of stoppages of the controllers would be very great, but these fears have not been realised, the failures amounting to 16 per month out of a total of 272. The cost of maintenance of the lamps should be reduced under this system, as the use of the controller abolishes the shock to the lamps due to the turning on and off of the taps, the opening and closing of the spring lighting door, and the mechanism of the anti-vibratory arrangement.

LONGSTOWE HALL

DETAIL OF ELECTRIC BELL-PULL

This bell-pull at Longstowe Hall, Cambridgeshire, is of "armour-bright" iron, with a small bronze figure of "Charity" on the ball within the handle.
JOHN W. SIMPSON, F.R.I.B.A., AND MAXWELL AYRTON, A.R.I.B.A., ARCHITECTS.

CONCRETE AND STEEL SECTION

(MONTHLY.)

L.C.C. DRAFT REGULATIONS FOR REINFORCED CONCRETE CONSTRUCTION.

The Council of the Royal Institute of British Architects having received a request from the London County Council to consider and report on their Draft Regulations for Reinforced Concrete Construction, formed the opinion that it would be most desirable to discuss the question of these draft regulations with representatives of the various bodies chiefly concerned with the subject to whom the London County Council had sent copies and requests for reports. The Council accordingly invited these bodies to join in a conference to discuss the matter, and the following representatives were appointed:—

Edwin T. Hall, V.-P. R.I.B.A., Chairman,	Royal Institute of British Architects.
Wm. Dunn (F.)	
H. D. Searles-Wood (F.), Hon. Sec.	Institute of Builders.
F. Higgs	
G. B. Godson	London Master Builders' Association.
Thomas Holloway	
William King	Concrete Insti- tute.
Frank May, J.P.	
Charles Marsh	Surveyors' In- stitution.
T. B. Short	
Sir Alex Stenning (F.), Past President Sur- veyors' Inst.	District. Surveyors' Association.
Howard Chatfield Clarke (F.), F.S.I.	
E. B. l'Anson (F.), F.S.I.	
Percival Currey (F.), F.S.I.	
Bernard Dicksee (A.)	
Ed. Dru Drury (F.) F.S.I.	
Wilfred Hardcastle (A.) F. A. Perkins	

The conference held four meetings, and discussed the draft regulations in detail, and certain observations were made and amendments suggested and set out in a report which was forwarded to the London County Council.

In forwarding this report, it was pointed out that the report of the Joint Committee on Reinforced Concrete issued by the Royal Institute of British Architects required revision owing to the progress of knowledge and experience, and that the Reinforced Concrete Committee is again sitting to consider what alterations are desirable.

The conference was of opinion that it would be best still to use the methods of calculation given in the report of the Royal Institute of British Architects on Reinforced Concrete, or subsequent reports made by the same body, and not to introduce formulæ into regulations, which would tend to stereotype these particular formulæ, and hinder the development of new modes of construction.

[The example of the London County Council is thus wisely seeking the co-operation and advice of those who should be in the best possible position to render such service will not, we trust, be lost on other local authorities.]

Systems of Reinforced Concrete.

The architect who has occasion to employ reinforced concrete for the first time will perhaps, if he has not paid some particular attention to the subject, be nonplussed by the number and variety of the systems of reinforced concrete he sees advertised and pressed on his notice, and he will probably not quite know what he should do in the matter. He hears, perhaps, vague rumours about the necessity for great care and the value of experience, and he feels nervous of entrusting the work to anyone who cannot point to a large number of executed buildings in which this system has been employed; and, indeed, he may feel that he had better remain conservative and stick to some form of construction of which he has had experience, and that has the warranty of general usage.

The Position of the Specialist.

Now, such an attitude is reasonable in the absence of sufficient information, and we therefore propose to offer a little advice on the subject. Reinforced concrete, though it has only become prominent in this country in the last few years, can hardly now be described as a novel form of construction. It is, as a matter of fact, quite sixty years old, and consequently a great deal of knowledge and experience has been accumulated among those who specialise in the design and execution of such work. It is well to go to specialist designers in this material, just as much as for steel work or heating and ventilation, and the other special trades; for it is a somewhat intricate business, and needs special knowledge to secure efficiency. In time doubtless it will become more of a commonplace of building construction, and architects and civil engineers may be able to employ it for simple cases without the intervention of a specialist, as they do steel to-day; but in the majority of cases we think that reinforced concrete will always need special study, for it is more intricate than steel work. Whether, as in the case of quantity surveying, the work will be done by a professional specialist, or whether it will be still the subject of competitive designing and tendering, as steel bridges often are, as well as mechanical engineering, must remain for the future to determine, but at least for many years to come it will be left to trade specialists with the advantages and disadvantages of competition in design and price. As at present there is so much general knowledge and experience available, the old objection to entrusting work to those who cannot point to many completed works is removed, and it would be safe as a rule to employ any of the specialist firms, provided that a guarantee is obtained.

Concerning Contractors.

As regards contractors, here again education has made such strides that almost any of the reputable firms of general builders are quite competent to undertake such work. An experienced clerk of works is always a desirability, however, and if he cannot be employed, then it may be required that the contrac-

tor shall take responsibility for both design and execution—a course which is theoretically the best, but may in practice not prove so desirable. Some of the well-known specialists undertake both design and execution, others the design only. In any case, the architect will require to have either a clear understanding as to the prices to be charged for any special commodities that may be employed should he entrust the firm with the designing without competition; or, if he throws the work open to competition in price and design, he should provide a very clear and detailed specification of the basis upon which the design is to be prepared, the safe working stresses that must not be exceeded, with various qualities of concrete and steel, the modular ratio of steel and cement, and so on, pending the adoption of municipal regulations in the district in question. Afterwards the design should be checked before final acceptance—not checked throughout, perhaps, but in important particulars, and allowing a certain degree of latitude. If that course is not pursued, it may be that risks will be taken in order to get the job, and as that is obviously very undesirable to all concerned, the more careful firms will welcome such stipulations, which are really safeguards for themselves.

Choosing a System.

No one can properly say at present that any one system is the best, and will suit all circumstances. It is therefore advisable at present that competition should be quite open, and this can be either done by writing to all the firms or by advertising for designs and estimates. Before requiring details of the designs to be submitted, however, the architect or engineer ought to supply the fullest particulars with drawings which can now be supplied cheaply by the many duplicating processes. The prices should be compared, and first the lowest satisfactory tenderer asked to furnish drawings and details for general checking before any others are put to that trouble. Those details will not be very full at first, for it would increase the cost of work unduly if every firm went into every job elaborately in the early stages. Sufficient time should be given to prepare a few working drawings if it is desired to check closely before acceptance; but in such a case it should be possible from the first general details received to give a provisional acceptance that will warrant the firms going to the expense. Some of our Government departments have not regarded this quite rightly in the past, and have led the specialists to incur much unnecessary expense by asking for too much in the preliminary stages. It is obvious that all such work has to be paid by someone, and that it eventually comes back to the consumer, and it is a bad policy for the community to foster ineffective or useless labour in any direction.

There seems a tendency with many persons to talk disparagingly of concrete, and especially of reinforced concrete. Such disparagement, however, really betrays ignorance.

The truth is that such ignorance is a legacy of the past, and the real cause of the objections to concrete in its modern employment is the opinion gained from experience years ago with inferior cement, and in the early days of usage, when little or no science was employed in concrete making. Perhaps the chief misconception that our users to-day have to get out of their heads is that concrete is a material made with a large amount of any old rubbish and a small amount of cement that serves to fill up holes, cover up delinquencies, and serve as a cheap and weak bearing surface. Concrete to-day is becoming recognised as an opportunity for care, science, and proper manufacture. The cement of to-day is very different from that supplied generally a few years ago. We know now that the materials of the aggregate must be clean and well graded, as well as properly proportioned and mixed. We know also that whereas about 50 tons per square foot was the average ultimate crushing resistance of good concrete, the best concrete of to-day will withstand 350 tons on an average, and even 600 tons as a maximum per square foot. Poor quality concrete to-day should have a resistance of 150 tons. It is therefore in consideration of modern concrete of the best that we should reconstruct our ideas.

Improvements in Material and Methods.

By all means let us use concrete as a filler when we want it for that purpose, and let it be as poor as may be—the proportions may now, however, by the exercise of a little science, be such as to show economy over older ways; for we can use proportions such as 15 to 1 with advantage. Cement has been steadily falling in price for many years past, and improving in quality, so that we find it economical to employ strong mixtures, and now that we can employ steel in conjunction we find we can construct satisfactorily from every point of view at much reduced prices. In reinforced concrete the materials are scientifically proportioned and graded, so that maximum density is obtained, with the minimum of voids, and the cement therefore goes further. The proportions are seldom weaker than 1 cement, 2 sand, 4 larger material, and often 1:1½:3 or 1:1 1-3rd:2 2-3rd is employed, and sometimes 1:1:2. The older concrete was made 1 cement to 6 Thames ballast (a material that is not well graded naturally, containing too much sand, and so letting the cement get lost in the voids), and for poor quality 1 to 10. Then also no attention was paid to cleanliness, and such proportions are not properly to be compared with modern ones of the same figures, for as before mentioned the cement was inferior, in great part consisting of coarse particles which were no better than sand, the cementitious property really depending upon the "flour"—i.e., the particles that pass the finest woven sieves. The word "concrete," then, in the term "reinforced concrete" means a very different material from that understood in the general conception of concrete.

The Architectural Treatment of Concrete.

The proper use of concrete architecturally is a subject that must increasingly attract the attention of architects. Experience and understanding of the material are primarily necessary to an elucidation of the problems that are arising in the architecture of the present and future with ever greater insistence because of the growth of

the use of concrete in modern buildings. We continue to employ concrete as the mere bones—the skeleton—of our construction, and bedeck it in clothes of any other material than that most nearly allied to itself even, and we seldom let it be seen in its nakedness where we attempt at all to treat it architecturally. Thus we see solid concrete walls built in situ and in blocks plastered with plaster of Paris or allied products internally, and rough cast outside. It is true that of late moulded hollow concrete blocks have pressed themselves forward into notice, but they have simply taken on the forms of—copied—stonework or brickwork. There are a number of cottages, built many years ago, at Croydon, from designs by Mr. Norman Shaw, R.A., in which the walls are of concrete slabs cast with a red-coloured face moulded into the shape of weather-tiling, and it must be confessed that they are an excellent copy and look very well until we find that like the stone villas built with hollow blocks to-day they are mere shams, pretending to be what they are not, a fact which soon becomes noticeable to even the ordinary layman who has "eyes to see." That, then, is not the way of architectural salvation.

Alternative Treatment.

The alternatives offered are to deal with the concrete itself, and in considering that we will exclude for the moment the plastered surface where cement mortar is used, though that is allied to that body. The methods that are offered at present are to secure texture if we cannot form by employing selected aggregates, working the material with paddles or blades inside the shuttering to bring the finer material to the face, and then removing the centering as quickly as possible so as to enable the surface to be scrubbed with a wire brush while green, thus exposing the aggregate and doing away with the glossy cement skin. If the work should have been unavoidably set too hard for this process we may employ scabbling hammers, muriatic acid (spirits of salts), or a sand blast to effect much the same effect. Another method that has been adopted is to cast the work in forms covered with a rough canvas which leaves its impression on the surface, and so gives a roughness that possesses "texture."

Surface and Form.

This last consideration suggests that patterned surfaces from the moulds might be legitimate, provided they clearly showed the material was concrete, and did not attempt to imitate some other. However, texture is not all—we must have form in architecture too—and by "form" is here meant detailed treatment, and not mass. We must, to express our ideas, have an architectural language, and texture is but a very elementary tongue. So then we come to the great stumbling-block with concrete. It must be confessed that in great part here we must leave tradition, which the architect feels so bound to, and so unsafe without, and it remains for the architects now and to-morrow to experiment with forms that shall fit themselves to the methods of manufacturing or manipulating concrete. We cannot employ the same mouldings as in joinery or in masonry, though we can still use some of a kind, for projections and indentations are easily cast. We could certainly employ repeated ornament or pattern the same as has been done for terra cotta, but that bears the stamp of the machine—as indeed does much of our pre-

sent day masonry and joinery—and lacks interest and does not befit the highest emotional art, but even here concrete should not entirely fail us, as indeed would be regrettable with so durable and strong a material that lends itself to the construction of gigantic buildings with such freedom.

Modelling in Relief.

There seems no reason why concrete, if we used a properly prepared cement, should not be modelled in low and high relief like clay. It would certainly lend itself to sgraffito. There is a white cement that is now being produced which removes the reproach of the grey colour so usually associated with cement, though we can by a choice of strongly coloured aggregates get permanent colour effects that look quite well in practice. Then, when it comes to ornament, we can insert in the concrete or apply to the surface in places marble, stone, terra-cotta, mosaic, and faience. Indeed, a good deal of work is being, and has been, done recently in the United States, where tiles have been embedded in the form of panels and strings to relieve the plain concrete surfaces, and we have seen some charming effects illustrated of treatments of chimneypieces, and other interior work in houses. Reinforced concrete is being employed now in England for several churches, and we see no reason why it should not be brought into the scheme of architectural treatment without being hidden under a skin of plaster, or covered externally with slates, tiles or lead.

Interesting Problems.

There is, however, much room for experiment in this direction; but considering that we are in the midst of the first real constructional innovation in durable building that permits of architectural treatment, which steel, no matter how important it was commercial, yet by reason of its impermanence could never be, it warrants the serious attention of the whole architectural profession for a solution of the problems it raises. Every material, of course, has its proper place and usage in architecture, and concrete can never replace any or all, but it must, and will, be employed for its own distinct sphere, which is, we can now see, a very wide one. It would be foolish to prophesy, but it seems most probable that our architecture will be transformed by reinforced concrete in a way which no other material or method of construction has done since the Middle Ages and the day of Gothic—which was primarily the period for the full development of the use of stone as a structural material. The architects of that day took the new methods, and gave an architectonic form that rose to the greatest heights of emotion, and we should see if we cannot do the same with concrete, both plain and reinforced. The Romans had concrete, of course, but it was not the same quite, and it was certainly not made in the way it is now, and their concrete did not, therefore, possess the possibilities of ours, so that the Romans, though they offer us a few hints as to how it may be used, by no means carried it to full development in any direction. Hence the future of reinforced concrete construction is a most interesting one from the architectural point of view, and there is every likelihood that the manner of treating it will ultimately be wholly successful in the hands of designers who possess the requisite knowledge.

ELEVATION TO MANOR GARDENS

NEW MONEY ORDER BUILDING, HOLLOWAY. (H.M. OFFICE OF WORKS.)

THE NEW MONEY ORDER BUILDING.

The new Money Order Department, Holloway, is the latest of a series of large buildings for the extension of Post Office facilities in London. The entire construction is in reinforced concrete on the Coignet system.

The building is composed of a main body with three wings. The total length of the front measures approximately 291ft., and the main body has a width of 50ft. The dimensions of the three wings are respectively 88ft. by 42ft.; 101ft. by 42ft.; and 76ft. by 42ft.

The total height of the structure from the ground level to the roof is approximately 85ft., and the structure comprises a basement, five reinforced concrete floors, and a flat roof. There are also a large number of mezzanine floors throughout the height of the main body. The walls of the

wings from ground floor are also in reinforced concrete, with a thickness of only 5ins. The front elevation is at present being executed in brickwork and masonry under a separate contract, by Messrs. Leslie and Co.

The elevations to Manor Gardens, and the west return of the front block are being executed in red brick and Portland stone. The sashes and casements throughout the building are of steel. The internal surfaces of the walls generally will be tiled, and the floors, which will have an area of about three acres, will be laid principally with maple blocks.

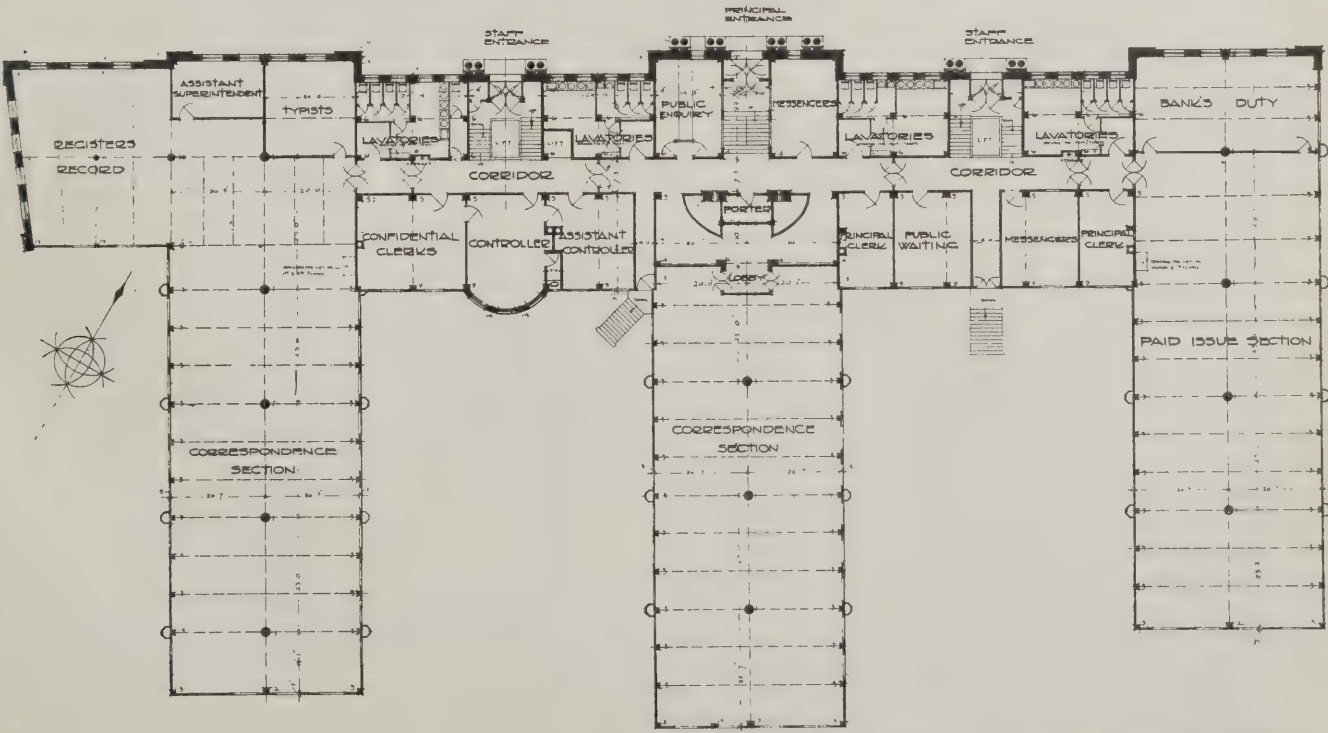

The stairs, balconies, and ventilation shafts are entirely in reinforced concrete, and a boiler house in the same material has been built partly underground at the back of the building. The dimensions of the boiler house are approximately 47ft. in length, 36ft. in width and 26ft. in height. The chimney shaft to the boiler-

house is by Messrs. Ingles, Warner and Company.

Owing to the nature of the ground, which is composed of clay, it has been necessary to make the walls of the boiler house in the shape of strong retaining walls. An underground passage provides means of communication between the boiler house and the various wings of the building. An underground water tank, of about 7,000 gallons, has also been erected in reinforced concrete.

The contractors for the reinforced concrete work, Messrs. William King and Son, who have also erected on the Coignet system the new Western District Post Office in Wimpole Street, have succeeded in completing their contract well within the time specified for the execution of the work. The concreting operations were begun about the middle of the month of December, 1909, and the building was practically completed at the end of July,

NEW MONEY ORDER BUILDING

GROUND FLOOR PLAN

H.M. OFFICE OF WORKS
CARLISLE PLACE
LONDON S.W.

MONEY ORDER BUILDING, HOLLOWAY: GENERAL VIEW SHOWING REINFORCED CONCRETE CONSTRUCTION.

1910, the time required for the execution being only about eight months.

The rapidity with which this large building was erected should go far to prove that reinforced concrete structures may, in certain cases, be erected more quickly than steel structures. It must be remembered also that the work was carried out during the winter, which is, of course, an unfavourable season for the execution of buildings, more particularly in reinforced concrete.

The Coignet system of reinforcement consists of round bars of varying diameters between 3-16in. and 1½in. embedded in the concrete in a suitable position to take up the tensile and shearing stresses. The reinforcement of the pillars consists of a certain number of longitudinal rods bound by a spiral wire of small diameter. The floors are composed of a meshwork of principal bars about 5in. diameter, and distributing rods of ½in.

The reinforcement of the beams is composed, in the lower or extended portion, of one or several groups of bars. Each group is composed of seven bars. The ends of six of the bars are bent upwards at an angle of 45 degrees, and hooked over a longitudinal bar of small diameter, placed in the upper compressed portion of the beam. By this arrangement the section of steel in tension is greater in the middle portion of the beam where the bending moments are higher, and the section

is gradually smaller towards the supports where the bending moments are less. The ends of the bars, which are bent up and gradually spaced closer together towards the supports, are intended to counteract the shearing stresses in the beam. The reinforcement of the walls is simply composed of a meshwork of ½in. bars. Several portions of the flooring were tested by the application of a load 50 per cent. in excess of the specified superload. The results obtained were entirely satisfactory in every case. "Ferrocrete" cement, supplied by the Associated Portland Cement Manufacturers (1900), Ltd., was used for this work.

The round bars of mild steel were supplied by the Earl of Dudley's Round Oak Works. The architects are Mr. J. Wager, A.R.I.B.A., and Mr. J. Rutherford, both of H.M. Office of Works; Mr. Rutherford superintending the execution of the work; Mr. W. Elliott being the clerk of works.

New Bridge at Earl's Court.

The great bridge at Earl's Court, which connects the eastern or lagoon end of the grounds with the middle portion, is to be demolished at once, and a new one built to serve both as a bridge and as an exhibition building or promenade. It will be 40ft. wide, with granolithic footways. The old bridge was erected in 1887 in celebration of the first Jubilee of Queen Victoria's reign.

POINTS IN GENERAL CONCRETE PRACTICE.

BY THOMAS POTTER, M.C.I.

The following is an abstract of a paper under the above title which was read by Mr. T. Potter, at the meeting of the Concrete Institute held on Thursday, December 15, 1910, at the Royal United Service Institution, Whitehall, London, S.W.; Sir Henry Tanner, President, in the chair.

Concrete practitioners in the past, engaged in building practice, appear to have kept their experience very much to themselves, except in connection with engineering works and specialities in connection with reinforcement for walls, floors, roofs, and similar purposes, which have been dealt with in a voluminous manner by specialists and patentees. This paper, therefore, has been confined to the use of concrete in connection with buildings, apart from any association with reinforcement or steelwork, for the consideration of which the limited time at disposal is insufficient.

Theory and Practice.

Concrete and its application appear to set most theories at defiance—many that have been proposed hitherto, with every good reason for acceptance, have been negated in practice. No doubt, eventually, there will be much valuable information and data made common in connection with the use of concrete that may be relied on by the architect, builder, and clerk of works. At present the information available is not altogether of that character. For this reason treatises on concrete, written only a few years ago, even, based principally on theoretical deductions, should be read with caution. Its very simplicity has led to its abuse; for it has been, and is still often, considered that anything nearest to hand—for instance, pit gravel of any description, broken stone and brickbats mixed with all kinds of rubbish—will do for an aggregate, that the cheapest cement in the market is quite good enough for a matrice, and that the cleanliness of the water requires no consideration—anything will do. This is altogether wrong.

The Human Equation.

Another factor is the human equation. The cement may be good, the aggregate of a suitable nature and well graded, and the water clean; but if the materials are not thoroughly mixed, and the water is not suitably proportioned, the value of the concrete is seriously diminished. Machine mixing remedies this to a great extent; but for many building purposes mixing machines do not seem as yet to find much favour. The mixing of concrete is not a favourite occupation with workmen; it is laborious work, which can be lessened if the materials are not wrist-turned, but simply lifted in the shovel and deposited close at hand without being turned over. Workmen who are efficient as labourers in most directions are not always equally so as concrete workers.

In the author's experience, the better class of country labourers are by far the best for the purpose; they are willing, have no preconceived notions as to the fitness of things, and are tractable. Many town labourers are very much the reverse.

Suitable Aggregates.

The principal materials more or less adapted for aggregates, most of which the author has used, are granite and other stone quarry chippings, broken brick or tile-yard debris, burnt clay, slag from iron ore, flints, furnace or boiler ashes, coke-breeze, and chalk. Chalk would be rarely used in an ordinary way, more

especially the top stratum, which is soft, porous, and easily affected by frost; but the author had used it where it was difficult to obtain any other except from a long distance. For small holdings in chalk districts, no doubt good substantial dry walls can be made with chalk concrete if better aggregates are difficult to obtain.

Coke Breeze.

Coke breeze as an aggregate is thought by many to be beneath notice. It was extensively used for many years, principally for floors, but, the author thought, undeservedly lost its character some time since through a letter in the "Times" telling of its failure in Germany, where it had been prohibited. It was not stated, Mr. Potter believed, of what class of coal it formed the residue, and this is an important point. He had seen some in Scotland totally unfit for concrete purposes, but not in England. This letter was followed by others telling how it was of such an inflammable nature that if exposed to a severe fire it was second only to coal in assisting combustion. Another letter stated that it disintegrated in the course of a few years, and crumbled away. The author thought that this backing up of the first statement was a case of giving a dog a bad name.

So far as its strength is concerned, Mr. Kirkaldy made some experiments for the West Ham Corporation some years since, with the following result: A brick pier 18 in. square, and 18 in. in height, made with best stock bricks and blue lias lime mortar, crushed at the end of two years with 46 tons per sq. ft.; a similar pier of Harold Wood bricks and blue lias lime mortar crushed with 75 tons per sq. ft.; another pier, made of six parts of coke breeze to one part of Portland cement, crushed with 131 tons per sq. ft.

As to inflammability, the tests made by the Fire Prevention Committee with various kinds of floors, each under similar conditions exposed for three hours to an increasing and ultimate temperature of 1,900 deg. F., and water played on them from a hose pipe, gave the following results: Coke-breeze and burnt ballast equal and best; each was found, after being allowed to cool, practically free from cracks of deflection, and Thames ballast and granite chips the worst.

The author had used some thousands of tons of coke-breeze for floors, and did not remember a failure of any kind therewith. He was aware that coke-breeze is condemned by many as an unsuitable aggregate, but could only speak from his own experience; and, although it is not, taken altogether, the best material for floors and roofs, he had found it one of the best. But, as with other materials, there are good, bad, and indifferent qualities; he had known ashes from dust-holes to be mixed with it.

Boiler Ash.

One of the best aggregates for most purposes is ash from locomotive boilers. It contains no impurities, is obtainable at most railway stations, and is inexpensive; but one company allow their engine drivers, when passing through a lias limestone district, to use fragments of limestone in the furnaces to economise the coal consumption. How they obtained it the author could not say, but it is not very perceptible among the ashes, and does not shake perhaps for some time after the concrete has been in place; but when it does it entirely ruptures the concrete. The author had known floors and stairs to be entirely reconstructed as a result. He believed no other railway company sanc-

tioned this, but where locomotive ashes are employed enquiry should be made relative thereto.

Plaster of Paris.

As is well known, plaster of Paris was used as a matrice previous to the employment of Portland cement. Where alterations have been made to buildings with floors of this description, the old concrete has sometimes been re-used as an aggregate, with the result that expansion has taken place, and the concrete has been ruined.

Aggregates that have passed through fire are charged more or less with sulphur, and slag from iron ore more than any other. The only way to liberate the sulphur is to expose it to the atmosphere for as long a period as possible. The author had used slag that had been aerated for a long period, which made concrete less susceptible to change of form than any other aggregate. United States Government tests have proved that the carbonate of lime which forms so large a constituent of Portland cement neutralises the effect of sulphur in aggregates to a great extent.

Parts of Aggregates Equivalent to Sand.

It is usual to specify that the sandy and dirty element in some aggregates shall be screened out and replaced by coarse, sharp sand, but the author could never understand the object of this. The coarse sandy element of suitable aggregates, such as slag furnace ashes, brick debris, or crushed stone chippings, is in every way as good as pit or Thames sand, but it is desirable to eliminate the portion below the size of coarse sand, and perhaps it is considered impracticable to remove one without the other. But the author's experience is that it is more economical and effectual to wash out the fine dirty and dusty particles, and leave in the coarse sandy ones. He could not call to mind ever at any time mixing sand with an aggregate, or being called upon to do so. River gravels as a rule contain sufficient, and a stone-crusher can be set to reduce any material to make quite fine enough for the purpose.

Grading Aggregate.

The size of the aggregate has long been a disputed point, but United States Government tests have confirmed what has always been the author's practice—namely, that, no matter the purpose for which it is used, the coarser the aggregate, provided perfect homogeneity or denseness is secured, the stronger the concrete. The size, however, depends upon the nature of the work. A very coarse aggregate, so that it is graded by intermediate sizes down to that of coarse sand, would be the best for wide and deep foundations, but far too coarse for floors, roofs, walls, or partitions—it depends entirely upon their thickness.

It has been attempted to standardise the size of aggregates for various purposes, but the author contended that it depends entirely upon good grading, and that there are few materials which come to hand in their natural state, or converted by a crusher, that are well graded.

Cleanliness.

The cleanliness of the aggregate is another factor of the greatest importance. Most aggregates are unclean, except, perhaps, river gravel from a quick-running stream. Very few pit gravels are clean, and as a rule they are the most difficult to wash. They are usually mixed with unctuous clay, which is difficult to get rid of, and which is injurious to cement. If

clean, the particles are usually of a rounded shape, the result of attrition at some former period, and not a desirable one for an aggregate.

It may be thought that quarry waste, brick-yard debris, slag, and materials generally that have passed through fire, are quite free from deleterious matter, but they are not. If they have passed through fire, and been broken by hand, or by a stone-crusher, the particles will be found covered with a fine impalpable dust, almost imperceptible. If they are washed in a tub, as an experiment, and kept well stirred, the water will be found charged to a considerable extent with this dusty element, which is injurious to cement.

Practically nearly all aggregates are very much improved by washing, which is an economic process if measured by strength.

Mixing Concrete.

The aggregate and matrice should be turned over twice dry, and twice while water is being added, and never less; the more they are mixed, the better the concrete, and the more readily the various sized particles find their respective positions in the mass. For many years it was advocated that only as much water should be used as will coat the aggregate with the cement, and render the concrete of a sticky character. Actual practice is convincing enough to prove that this is wrong. The particles of the aggregate do not slide easily into place, and the concrete is not dense. But if the concrete is in a sloppy condition, better homogeneity or denseness is the result. It is almost needless to say that the water used in mixing concrete should be clean; if otherwise, the effect is equal to that of using an unclean aggregate.

Plums or Packing.

What are known in the United States as "plums," but which the author had always called "packing," are pieces of broken stone or quarry waste, or other suitable materials of considerable size embedded in the soft concrete as the work proceeds. Packing may be any size so long as it does not reach the vertical faces of foundations of monolithic walls by at least 2 in., and the particles are kept apart at least 2 in., and are well rubbed in the soft mass, not merely laid on the concrete. Obviously the material must be clean. Some practitioners claim that packing adds to the strength of concrete; and, if carefully dealt with, it certainly does not diminish it so far as the author's experience goes, and it lessens the cost.

Concrete Walls.

The disadvantage of building monolithic concrete walls is the cost of the forms or shuttering necessary for forming the troughs in which the concrete is to be deposited. In some cases it is common knowledge that it has cost as much as the concrete. In addition, unless it forms a backing to stone or brickwork, it has to be cemented or rough-cast externally, so that the cost is often more than that of brickwork.

For buildings of some magnitude—of a plain character, free from irregularities of plan, and of simple design, such as warehouses, farm buildings, and factories—it can be used in most cases to advantage, so far as regards cost, while it possesses much greater strength and durability and freedom from the necessity of repairs—more so than ordinary brick walls. It is too early to affirm how long monolithic Portland cement concrete

buildings are going to last, but there is not much doubt on that point. The oldest in this country probably does not exceed forty-five to fifty years.

With regard to monolithic concrete walls being weather-proof, the author had never known an instance of their being otherwise, if they were cemented or rough-cast externally.

We are told at times that plastered concrete walls are subject to condensation, but they are not more so than walls of stone or brick, or as much; with the further advantage that after a period of six months, or thereabouts, condensation very rarely occurs in an ordinary house, owing to the walls being of a more equable temperature. The concrete walls of a public building, when the latter is crowded, may give evidence of condensation, but that does not come within the author's experience.

As a hygienic material, concrete is superior to any other. If we go into the rooms of a brick house after they have been shut up for some time, there is often a musty, fungusy smell prevailing. The author had never found this in a concrete house or a cottage after it had been closed for a time. The rooms in a well-built concrete house are cooler in summer and warmer in winter than those of a brick house, as concrete walls are more equable in temperature.

The Future of Concrete.

With regard to the future of concrete for buildings, and allied purposes in large towns, its present use seems to indicate that it will be confined principally to floors and roofs, and in connection with skeleton steel-frame construction, and certain purposes for which cement and granite chips can be employed, such as pavings, steps, stairs, sills, lintels, etc. Monolithic reinforced walls will possibly not find much favour; there is the difficulty of external surface treatment, the cost of temporary forms, and minor difficulties which would not occur in most districts. In the country there should be more scope for the use of concrete. Eventually concrete building may be, and should be, a distinct occupation. The walls of factories, workshops, warehouses, and a similar class of buildings where no great architectural efforts are needed, and which are simple in plan and arrangement, can be built at a less cost than with brick or stone; and for farm buildings it is still better adapted, as it is applicable not only to walls, but to pavings for livestock places, and for floors, and almost the entire fitments. Mangers, feeding-troughs, water-troughs, tanks for storing rainwater, stable stall divisions, channel gutters, and manure pits, are all better executed with concrete than with any other material, and at a less cost.

Buildings of this class are practically free from the farmer's enemies, rats and mice, or can be made so with a little care. Rats, the most cunning of rodents, very much dislike concrete buildings. They can bore their way through a brick-wall, but they never attempt to practise on a well-constructed concrete wall, and are averse from occupying buildings that afford better retreat than open doors, and harbours of refuge which are not out of reach of man and dog.

For cottages and buildings, for small holdings, it is also well adapted. Where low-lying grass lands and meadows are intersected by running streams, there is a necessity for foot-bridges, cattle bridges, sluices, hatchways, sheepways, etc., and for which there is nothing can compare with concrete for economy of cost and durability.

Mr. E. Fiander Etchells, Mr. S. Bylander, Mr. R. W. Vawdrey, Mr. E. Wait, Mr. Henry Puplett, Mr. L. Serrailier, and Sir Henry Tanner took part in the discussion which followed the reading of Mr. Potter's paper.

PROPORTIONING CONCRETE.

What is called the "density of a mortar" is the total volume of solid particles—exclusive of water and voids—entering into a unit volume of mortar. If the term "density" be applied to sand alone it means the proportion of the measured volume of the sand that is occupied by the solid sand grains. For example, a sand having 40 per cent. voids would have a density of $1.00 - .40 = 0.60$.

The "elementary volumes" in a unit volume of fresh mortar consist of the absolute volumes of the cement, sand, water, and voids, each expressed in the form of a decimal. To illustrate: the "elementary volumetric composition" of a mortar mixed 1 part cement to $1\frac{1}{2}$ natural sand by weight was:

Cement (c)	= .226
Sand (s)	= .499
Water (w)	= .234
Air voids (v)	= .041

Total volume = 1.000

Expressing this in more familiar terms: 22.6 per cent. of the unit volume of the given mortar consisted of solid particles of cement, 49.9 per cent. of particles of sand, 23.4 per cent. of water, and the remaining 4.1 per cent. of air voids. The "porosity," represented by the sum of the water and air voids was 27.5 per cent., and the "density" of the mortar was 72.5 per cent.

The following is a list of specific gravities of various aggregates used in concrete, and by weighing a cubic foot of material in the state in which it is to be used, we can from these data, calculate the density and porosity.

Weight of solid	cubic foot of rock.	
Sand ...	2.65	165
Gravel ...	2.66	165
Conglomerate	2.6	162
Granite ...	2.7	168
Limestone ...	2.6	162
Trap ...	2.9	180
Slate ...	2.7	168
Sandstone ...	2.4	150
Coke Breeze	1.5	95

We can calculate the volume of materials required to make any volume of concrete by the following formulæ:

Let c = absolute volume of cement.

s = absolute volume of sand.

g = absolute volume of gravel or stone.

w = absolute volume of water.

a = absolute volume of air.

m = ratio of absolute volume of water plus air voids of cement to absolute volume of cement. (The absolute volume of a material is that obtained by deducting the voids.)

n = ratio of absolute volume of water containing grains of sand plus air entrained in gauging to the absolute volume of sand.

p = ratio of absolute volume of water coating particles of aggregate plus air voids (due to imperfect mixing) to absolute volume of aggregate.

v = volume of concrete produced.

Then $V = c + mc + s + ns + g + pg$;
or $V = (1 + m)c + (1 + n)s + (1 + p)g \dots (1)$

The ratio n is composed of two variables, one depending on the coarseness of the sand, and the other upon the ratio of cement to sand, since a lean mortar contains more air voids than a fat one.

It so happens that this ratio, by a coincidence, can be expressed as a factor, experiments showing that the variation of voids caused by different proportions may be provided for by taking the cement and sand together. For different proportions of the same cement and sand the sum of water and air voids is approximately a constant.

Where there is no sand formula (1) must be used, but we can reduce it for ordinary working conditions to the following:—
Let

r = ratio of absolute volume of water plus air to volume of cement plus sand.

Therefore, by definition,

$$r = \frac{1 - (c + s)}{(c + s)}$$

From which

$$1 + r = \frac{1}{c + s}$$

Then $V = c + s + r(c + s) + g + pg$
 $= (1 + r)(c + s) + (1 + p)g$.

Substituting average values for r and p we get $V = 1.34(c + s) + 1.08g$.

If extremely fine sand is used, then we have $V = 1.65(c + s) + 1.08g$.

The constant $(1 + p)$ varies between about 1.04 and 1.08, so it may be varied also if desired. If we substitute for the absolute volumes c , s , and g , the measured volumes C , S , and G , multiplied by their density d_c , d_s , or d_g , (i.e., proportion of solid material therein) we get the formulæ into a working form. Thus as cement is assumed to weigh under average conditions in practice 90 lbs. per cub. ft., and the specific gravity is 3.1, and water weighs 62.4 lbs. per cub. ft., we have

$$d_c = \frac{90}{62.4 \times 3.1} = .466.$$

Thames sand again weighs about 102 lbs. per cub. ft. Therefore its density is $d_s = \frac{102}{165} = .617$. In the same way we may find d_g .

The formula then becomes—

$$V = 1.34 \times .466 C + 1.34 \times .617 S + 1.08 G d_g$$

Supposing we require to know the amount of cement, sand, and aggregate in a cube yard of concrete we substitute 27 cub. ft. for V and express the proportion of S and G in terms of C . Thus for a 1:2:4 mixture we put $S = 2C$, $G = 4C$, and we then ascertain the value of C in cub. ft., and having that, can get S and G . As it is best always to specify cement by weight, we first multiply the number of cub. ft. thus ascertaining by 90 to bring it to lbs. This rule is simple to use and enables us to tell very exactly the amount of materials entering into a cubic yard of concrete, which varies with the kind of materials and the proportions. It will avoid the mistakes often made by contractors who work on rough assumptions. Indeed, many have made the mistake of supposing that 1 yard of cement, 2 yards of sand, and 4 yards of gravel will yield 6 yards of concrete, thinking that only the cement is lost in the interstices, whereas most of the sand disappears also. But not all goes, and we should determine the exact amount by making a few experiments, and using the foregoing formula, if we are to be scientific and estimate closely.

A BELATED ATTACK ON REINFORCED CONCRETE CONSTRUCTION.

In the "British Clayworker" for November there is an article entitled "Some Disadvantages of Reinforced Concrete." The title is sufficiently frank; and the article itself is a perfectly legitimate piece of special-pleading—only that, and nothing more. The writer's statement of the case against reinforced concrete must be somewhat heavily discounted in view of the fact that he holds a brief for bricks. Nevertheless, he has the temerity to speak of "the exaggerated claims of commercially interested persons!"

As this journal happily does not labour under any such embarrassing disqualification, but has for its sole object to serve faithfully all sections of the building trade, and to state only what we believe to be strictly true with regard to any and every kind of method and material, it is very far from our intention, now or upon any other occasion, to take up the cudgels of any one section against another. Besides, what we have seen of the newspaper war on this subject, which is waged with intermittent fury in the rival trade organs of the United States, leads us to deprecate any approach to a similarly futile and exasperating controversy in this country. Consequently, we do not care to traverse point by point the altogether one-sided statements of the writer in the "Clayworker." Almost every point that he raises has been dealt with in these columns; with the all-important distinction that whereas he sets forth only one side of the question, we, being absolutely free from the slightest reason for bias one way or the other, have always tried to keep the balance level, and have, therefore, felt ourselves entirely free to state both sides of the question without fear or favour.

We have, for instance, constantly insisted on the necessity for careful supervision of the work and testing of the materials; and we have also never denied the difficulty of the problem of architectural treatment of the material. On the other hand, unlike our contemporary, we have never exaggerated these points. Difficulties are to be overcome; and in both these respects there is to be noted a constant tendency towards increased efficiency on the one hand and improved appearance on the other; but this tendency our contemporary, approaching the subject in a partisan spirit which cannot be disguised, has seen fit to ignore. It is much too late in the day to advance these objections; because, at the present time, there is no dearth either of expert designers or of skilled workers in reinforced concrete. Our contemporary's contention, therefore, that "workmen will not, and, moreover, cannot reasonably be expected to realise the responsibility thrown upon them," is not only belated, but quite gratuitous. Very much more delicate and difficult operations than those exacted from the workmen trained in reinforced concrete work are conscientiously and successfully performed daily and hourly in many other industries by persons who are less highly paid and less sedulously watched.

Our contemporary's rather lame deduction from this wholly one-sided and by no means deadly indictment of reinforced concrete is: "Having regard to all these circumstances, it would appear that brickmakers have no reason to fear the

This is an example of a reinforced concrete construction carried out with stone walls. The elimination of external scaffolding not only saves a considerable amount of money, but its construction would prove impractical, even impossible, in structures which run to thirty and forty storeys high.

HOTEL TRAYMORE, ATLANTIC CITY N.J.

extensive use of reinforced concrete in the near future." But why shut one's eyes to the facts? We regret exceedingly the depression under which the brickmaking industry is at present suffering; but we cannot regard it as being wholly accounted for by slackness in the building trade. Surely it is quite obvious that the many large and important reinforced concrete buildings that of recent years have sprung up all over the country must have had a very seriously restrictive effect on the output of the brickyards. But surely it is better to face the fact than to pretend to ignore it. Almost alone among the professional journals we were quick to recognise the possibilities of what can be no longer called the new system of building. It is because we discerned that its rise and progress would be inevitable that we urged—as we still urge—upon architects and builders to take every possible means of mastering its peculiarities. Events have justified the attitude that we have consistently assumed. Reinforced concrete construction has largely and will increasingly supersede brickwork building

in the circumstances to which it is peculiarly adaptable. That it will ever wholly supersede brickwork we neither believe nor desire. The two systems, we feel perfectly confident, will exist coevally as long as man requires huge business premises and comely habitations; and he who aspires to be a complete builder will not be so foolish as to take sides in an unholy war between the two systems—for that way madness lies—but will wisely avail himself of every opportunity of turning both to his advantage. Hence we deprecate any and every attempt to exalt one at the expense of the other. There is room for both; and a mere partisan attack on the newer but no longer novel method is curiously behind the times, considering that, to mention only two most significant facts, the London County Council has not only procured an Act of Parliament sanctioning its adoption but is actually teaching its principles and practice at the Brixton School of Building; while the Government Departments have given the most convincing proofs of their confidence in reinforced concrete construction.

REINFORCED CONCRETE BRIDGE. MOORTOWN ROAD

(Particulars on next page.)

COLOURING AND WATER-PROOFING CONCRETE.

The colouring of concrete, which has been a very perplexing problem, is, like the other uncertainties that have attached to concrete construction, gradually becoming simplified and certain. At the same time, the demand for artistic and satisfactory exterior colour treatment has become very general, at all events in the United States, owing both to the uncertainties of tone produced by the natural concrete and its variation, and to the cold and cheerless monotony that prevails where a large number of concrete buildings are grouped together.

The experimenters in concrete colouring have, says Mr. March G. Bennett, in the "Cement Age," groped and tested for years, with many failures and few successes, but the failures have been almost as educational as the successes, and the natural result is a much more definite and clear idea of the requirements than ever before. Probably the first attempts at colouring were made by mixing ordinary mortar colours into the concrete or plaster. Occasionally this was successful, but in the vast majority of cases the colouring was patchy and uneven, and off shade. It is almost impossible to make a good even tone by such mixing. Another fundamental objection to this method of colouring is that it certainly weakens the bond to a greater or less degree, and engineers and architects are agreed that even the slightest weakening by such a mixture is objectionable. The next method was by the use of ordinary paint, but the alkali in the cement promptly put an end to this, because the almost universal result was destruction of both the colour and the fixative, causing the compound to fade, and the surface to peel off.

Then came the special coatings, compounds that avoid weaknesses of paint, but which are essentially painty in their character and form a thick coating over the surface of the cement, entirely covering it up, and substituting the colouring material for the cement surface.

In cases where colour only is desired, and texture is of no consequence, these coatings have proved quite satisfactory, but for those who desire to preserve the natural texture, and at the same time to get an artistic colouring effect, such a material will not be satisfactory. The problem is precisely the same as that of woodwork, so far as artistic value of the results is concerned, and those who prefer the smooth even surface of a heavy paint will find the cement paints or coatings satisfactory, while those who prefer the transparency, and depth, and softness of the stain effect will not be pleased with anything that is opaque and painty.

Therefore, it is this large and increasing group of cement users that the cement stains have been designed to please. The stains are transparent, and colour the surface of the concrete without covering it with a thick coating like paint. They sink into the pores and preserve the natural texture of the cement almost as completely as though nothing had been applied, while at the same time colouring it in rich, deep tones that are infinitely more artistic in their character than any opaque coating can be. Many other advantages are claimed for stains as compared with all other colouring agents for cement work. Prominent among them are the ease and rapidity with which they can be applied. Any intelligent workman can apply them, using a broad flat brush, and doing the work more than twice as quickly as a heavy painty material can be put on. Then, they

cover from twice to three times as much surface per gallon as the heavy paints, and their original cost is very much less. This makes the job more economical in every item, but in addition to this it is maintained that the wearing qualities of the stains are much more satisfactory than those of any other colouring agents. The fact that they do not form any skin or coating over the surface makes it impossible for them to crack or peel off. They, therefore, grow gradually softer with age, and the result of this is so agreeable that many users are contented to let them stand for many years without renewing. "Growing old gracefully" is one of the phrases used in setting forth the merits of these compounds.

But, in addition to these colouring advantages, the stains waterproof the surface completely and permanently. The vehicle contains an indestructible waterproof compound, which enters and seals the pores of the concrete, and as it does not oxidise by age, this waterproofing effect lasts for all time. In this respect, of course, the stains have an argument that cannot be used in favour of the coatings, none of which claim to be really waterproof. The waterproofing ingredient used in the stains has been tested upon actual work of various kinds for more than twenty years, and has thoroughly demonstrated both its efficiency and its permanence.

Vice-Consul A. A. Williamson quotes from a Manchurian paper the statement that "an official of the South Manchurian railway has, by dint of application, invented a new use for soya-bean oil as material for preparing a waterproof liquid which is pronounced by the experts of the Dalny central laboratory of that line to give greater durability at a cheaper cost."

THE ADAPTABILITY OF CEMENT.

With reference to the Cement Exhibition recently held in Madison Square Garden, New York, the editor of the "Cement Age" said that visitors from a distance will find at every stage of their journey increasing evidences of the multi-fold uses to which the product is being put. They will cross viaducts and bridges of reinforced concrete; they will see water tanks of cement; there will be an occasional suburb in which there is a colony of neat "poured houses," almost as if they had been hewn out of solid blocks of cement; barns and cribs with cement floors will be found all along the routes. As they cross the ferry from Jersey City they will see, jutting out along the waterfront, the magnificent new docks of the city of New York, built of concrete and steel. They will ride through the concrete subway, walk on cement sidewalks, and sleep in fireproof hotels built of reinforced concrete.

Mother Invention has been active in causing the civil engineers and the architects of the 20th century to develop the possibilities of this artificial compound as our supply of timber rapidly decreases. The initial high cost of granite and sandstone, as well as the difficulty of handling large blocks of the heavy material, has caused builders to use cement wherever possible. The relative superiority of the higher grades of Portland cement over all the cheaper grades of brick has brought about an ever-increasing popularity of the artificial compound which was invented by an Englishman—Joseph Aspdin—in 1824. This manufacturer from Leeds took out a patent on a cement which he made by calcining a mixture of limestone and clay. He gave the resulting product the name of "Portland" because of a fancied resemblance between the set cement and the famous limestone at that time extensively quarried for building purposes at Portland, England. The name has adhered because the product looked like Portland stone, and not because it originally came from Portland. As a matter of fact, there never has been a cement manufacturing plant at Portland, England; Portland, Oregon; or Portland, Maine.

The most gigantic project for which American Portland cement has ever been used is, of course, the Panama canal. In this work it is estimated that 8,000,000 cubic yards of concrete will be used, chiefly in the construction of the six mammoth locks, in duplicate, 1,000 feet long and 110 feet wide, two of which will be $41\frac{1}{2}$ feet deep and the other four 30 feet. Concrete also will line the great spillway of the artificial lake at Gatun. The contract for furnishing this enormous amount of cement was let after open competition. Most of it is being made in Northampton, Pa., and is being shipped through Jersey City. The contract calls for 4,500,000 barrels of cement, and not more than 10,000 nor less than 2,000 barrels per day must be ready for shipment.

The great dam which is to be thrown across the Mississippi river just below the rapids at Keokuk, Iowa, is exceeded in size only by the great Assuan dam across the Nile. This American dam will require 500,000 barrels of cement and 7,000 tons of structural steel. It will be 37 feet high, seven-eighths of a mile long, and 43 feet thick at the base. When it is completed the dam will enable the harnessed "Father of Waters" to supply 200,000 horse-power to a territory which will embrace St. Louis, a distance of 170 miles to the south.

Cement has been put to an entirely different use at Cambridge, Mass., where it was the material selected for the Harvard stadium, an enormous structure seating 40,000 people, which was built at a cost of 475,000 dollars. This is the largest athletic arena of its kind in the United States. Last summer a similar structure of cement and steel was completed in Tacoma, Wash., and presented to the city. It is a stadium seating 30,000, and will be used for high school athletic and similar events. The cost of 130,000 dollars was met almost entirely by popular subscription.

The steel and concrete steamship docks which have recently been completed in New York harbour at a cost of 10,000,000 dollars demonstrate how well cement lends itself to decorative architecture. There are nine of these piers, seven double and two single, and their substantial architectural lines, as well as their pleasing yet unobtrusive ornamentation, are in striking contrast to the old docks which were an eyesore along the river front so many years. The initial cost of 10,000,000 dollars was not so great when it is remembered that the city is receiving an annual rental of 565,000 dollars from the steamship lines using the docks.

Except in such cases as the one mentioned above, cement has played only a small part in decorative architecture up to the present time, but after the successful moulding of a colossal statue of an Indian in Illinois, it would be unsafe to say that the greyish powder will not in the future be adapted to artistic uses. This statue is of Blackhawk, chief of the Sacs and the Foxes. It is 48 feet high, and stands on a rocky bluff 250 feet high, near Eagle's Nest across the river from Oregon, Ill. The artist was employed for three years in its construction, but he believes that he has created a work of such enduring art that it will be in existence long after the Egyptian sphinx has crumbled into dust.

The United States Department of Agriculture recently gave a great impetus to the cement industry by issuing a bulletin setting forth the truly startling losses suffered by farmers, grain merchants, and others through the depredation of rats. This bulletin gives in detail plans for laying cement floors to all barns, corncribs and cellars. A national warfare is to be waged against the rodent, not only because he is a ravenous feeder and exacts an annual toll of millions of dollars worth of farm products, but because as a spreader of disease and epidemics he is a paramount pest. The ravages of the bubonic plague are said to lie solely at the door of the rat. The cement floors, making impossible any ingress to the grain bins, will, it is believed, effectually check the career of the tiny but terrible devastator.

The cement or "poured" house is gradually attracting attention throughout the country. These houses are made by erecting steel or iron moulds and literally pouring them full of "house." When completed the building is fireproof, absolutely sanitary, and can be washed out with a hose. Many big manufacturing concerns which require numerous small houses for the use of their factory hands, are considering the advisability of adopting the "poured" house as an economic move. Where a number of dwellings are to be poured in the same locality the cost is materially lowered, as the taking down and setting up of the mould more than once is avoided, it being possible to move it from lot to lot intact.

In the Far West, where so many irrigation projects are being fostered, cement is being put to even more uses than in the eastern States. The largest fence in the world has recently been built in one of the Rocky Mountain States. It is 7,400 feet long, 8 feet high, and 4 inches broad at the top. Cement telegraph and telephone poles have been used successfully, and have met with some favour. Heretofore, the railroads have been unable to make use of the concrete tie in railroad construction, because they found it too rigid for long service. Recently, however, it is asserted that George Gates, of San Jose, Cal., has sold to a syndicate of eastern railroad men for 17,000,000 dollars the patent right for a process of concrete tie-making.

In all cases where compressive rather than tensile strength is required, cement has been found to be highly satisfactory, the comparative resistance to forces of compression and tension being 10 to 1. Five years ago one barrel of cement was used to every 1,000 feet of lumber. To-day there are 16 barrels used to every 1,000 feet. It is estimated that for the year ending December 31st, 1910, 75,000,000 barrels of cement will have been used. And the cost has decreased with the increase in demand. In 1880 the manufacturer received 3 dollars a barrel for his product. Last year the average price was 81 cents.

Cement is made by heating a mixture of lime, silica, and alumina in certain fixed proportions to a point of incipient or semi-fusion. After the burning process the resulting "clinker" is finely pulverised, and carefully protected from moisture until ready for use.

Tests recently conducted by the United States Government at Sandy Hook have proved the adaptability of concrete for the construction of walls for fortifications. Twelve-inch projectiles were fired into concrete walls 22 feet thick, at a sufficiently high velocity to pierce 22 inches of steel, and while the shell went through the wall, the results were so gratifying that the Government is now considering the advisability of using this material in the new coast defence works in the Philippine Islands.

MOORTOWN ROAD BRIDGE.

The reinforced concrete bridge at Moortown Road, illustrated on the preceding page, was constructed by Messrs. the Cubitt Concrete Construction Co. of London. The span is 36ft., with 20ft. 6in. between the parapet walls. The maximum rise is 6ft. 6in. from the springing to the intrados. There are four ribs of parabolic form with 6in. slab spanning between, the filling for the haunches being placed on this slab, and the thrust of the arches taken by counterforts behind the apron wall. The bridge was tested with two 10-ton rollers standing side by side in the centre, and showed a deflection of 1-64in. on the main ribs, returning to the normal condition immediately on the removal of the load.

A Burst Water Main.

On Saturday of last week, a huge high-pressure water main over 12ft. in circumference, which conveys water from the works of the Metropolitan Water Board at Long Ditton to the southern district of London, suddenly burst with a loud report at a spot about halfway up Kingston Hill. The force of the water was so great that large paving stones were hurled a considerable distance, and part of the adjacent tramway track was torn up.

FEDERATION NEWS.

Barnoldswick.

The fifth annual dinner of the Barnoldswick and District Master Builders' and Kindred Trades Association was held at the Railway Hotel on December 23rd, 1910, when a large company was present under the chairmanship of Mr. L. Robinson.

The second toast, "Town and Trade," was proposed by Mr. J. Harrison, who said that, generally speaking, the trade of the town had been good.

Mr. P. Barrett, responding, said that a town could not prosper unless it was healthy and vigorous, and they as builders had a great deal to do with that prosperity, and it was to their interest as builders to erect healthy dwellings.

Mr. R. S. Windle, in proposing the toast of "The Association," regretted that the society was diminishing in membership. Mr. Ed. Smith, responding, said that the association was in a good financial position.

King's Norton and Northfield.

In presenting their annual report for the past year, the Committee of the King's Norton and Northfield Urban District Master Builders' Association state that there have been held during the past year nine committee meetings and ten ordinary meetings, also a well-attended open meeting held on September 8th last, when the Finance 1909-1910 (Act 1910) was discussed with the object of obtaining an interchange of opinion to enable members to interpret the questions asked in Form IV. by the Inland Revenue Authorities.

This association has become affiliated with the Birmingham Building Trades Employers' Association, entitling two members to sit upon their Conciliation Board in the event of dispute with operatives within a five mile radius. The President has attended the meetings of that association, and reported thereon at subsequent meetings.

A deputation consisting of the President, Mr. McDonald, and secretary, waited upon the Building Committee of the King's Norton and Northfield Urban District Council on March 22nd last, with recommendations for modification of some of the new bye-laws, the outcome of which conference was considered satisfactory.

A joint meeting of operatives and members was held on June 2nd last, respecting the inclusion of the fair wages clause in contracts entered into by the King's Norton and Northfield Urban District Council and the Worcester County Council. A correspondence ensued, and ultimately this association was assured that contracts entered into by the former Council contained this clause.

On June 23rd last an instructive and interesting paper was given by a member, Mr. W. J. Masters, upon "The Housing and Town Planning Act."

The annual dinner was held on February 3rd last, at the Exchange Restaurant, Birmingham.

The annual outing took place on July 13th last, the party visiting Oxford, where the principal colleges, churches, buildings, etc., were inspected.

As heretofore, the association has been loyally supported by the honorary members, and the members are earnestly requested to observe the inter-trading rule.

The report is signed, on behalf of the Committee, by Mr. Harold Grice, President, and Mr. H. H. Copeland, Secretary.

Middlesbrough and District.

The annual general meeting of the Middlesbrough and District Building Trades Association was held in the Corporation Hotel on Dec. 13th.

In the unavoidable absence of the president, the chair was taken by the Vice-president, Mr. W. S. Davison. There was a record attendance of members.

The hon. treasurer, Mr. Percy Bray, presented the financial statement, which showed that the association had more than paid its way during the year. There was a profit on the year's working, which, added to the balance brought forward from last year, and the amount on deposit, made the financial position of the association a very good one.

The report and balance sheet were adopted.

The secretary reported that during the year the association had held its own numerically. Several had for various reasons ceased to be members, but others had taken their places. The year had been a quiet one, our relations with the employees were good, and there had been no labour troubles. A few months ago it seemed as though the Conciliation Board would be called upon to consider a question of demarcation; but, happily, an informal conference had settled the matter. Good relations with the architects had been sustained. Two or three years back the quantity rule and intertrading rule involved much correspondence, and many interviews, but personal contact and the working of the rules had made for a better understanding. The trade during the year had been very moderate; in consequence, competition had been keen. We need a boom in the building trade to make us forget about the cutting of prices.

The executive meetings of the association had been very well attended, and there was also better attendance at the monthly general meetings; there was still room for improvement in respect to the general meetings, and the committee urge upon the members, both in their own interest and in the interest and in the interest of the association, a regular attendance at all its meetings. The report was adopted.

The following officers were elected for 1911:—President, Mr. George Hudson (Messrs. Hudson Bros., builders and contractors, Middlesbrough); vice-president, Mr. W. Masters (Messrs. Masters and Binning, plasterer contractors, Middlesbrough); hon. treasurer, Mr. Percy Bray (builder and contractor, Linthorpe), re-elected; secretary, Mr. Walter Rigby, 32, Newlands Road, Middlesbrough (re-elected); executive committee, Messrs. W. S. Davison, E. Baker, S. Coates, T. Wilkinson, H. McNaughton, W. B. Robinson, H. Doughty, T. Metcalfe, J. W. Vinter, G. Sherriff, and the officers; representatives Tees-side Federation Committee, Messrs. G. Hudson, W. Masters, P. Bray, H. McNaughton, W. S. Davison, T. Wilkinson, J. W. Vinter, W. B. Robinson, H. Doughty, E. Baker; representatives Northern Counties Federation, Messrs. G. Hudson, W. Masters, P. Bray, H. McNaughton, W. S. Davison, T. Wilkinson, J. W. Vinter, W. B. Robinson, H. Doughty, E. Baker.

The levy was fixed at 3s. 6d. per £100 wages paid.

A notice of motion in reference to slaters' subscription was on the agenda, but it was decided to let the rule in respect to this stand as at present.

It was decided to hold the next meeting in February.

After the meeting a smoker was held, Mr. Geo. Hudson (president) in the chair. There was a large attendance of members and friends. During the evening, opportunity was taken of presenting the secretary, Mr. Walter Rigby, with an oak side-board, and Mrs. Rigby with a gold brooch set with pearls and turquoises on the occasion of their marriage.—WALTER RIGBY, Secretary.

Sunderland.

The annual dinner of the Sunderland and District Building Trades Association, took place at the Grand Hotel, Bridge Street, on December 15th. There were present altogether 60 members of the association, and friends. Mr. J. Morice Wright (president of the association) presided, and there were also present the Mayor (Ald. Sanderson), the Town Clerk (Mr. F. M. Bowey), Mr. S. Smethurst (president of the National Federation of Building Trade Employers), Mr. A. G. White (secretary of the National Federation), Mr. John W. White (senior vice-president of the National Federation), etc., etc.

Mr. J. M. Gibbons proposed the toast "The Mayor and Corporation of Sunderland and other governing authorities," and the Mayor responded.

Mr. W. T. Weir proposed the toast of "The National Federation and the Northern Counties Federation of Building Trade Employers."

Mr. S. Smethurst, President of the National Federation, in responding, paid a high tribute to the services rendered by Coun. W. H. Hope to the Federation, and said the National Federation had become a very important body. It represented in all the large centres of population nearly all the important builders, and it was performing very useful functions. As it grew in strength and influence it was being appreciated by all the outside authorities in a way it was not eight or ten years ago. The Government Departments now consulted them on all matters pertaining to their trade. When the Federation came into existence first, they had to deal with working people, who were fairly well organised eight, ten, or fifteen years ago. They were so well organised, in fact, that they could impose their will on the building trade. The result was that very oppressive and restrictive conditions were brought into existence. The recognition by the trade unions that the building trade employers had become well organised had, however, made them more reasonable. He had, he said, always found architects eminently fair, but a tradition had grown up that gave them an authority that he did not think impartial men would deem fair. What they wanted and what he thought they would get by common consent would be the recognition of what was just and fair, so that those inequalities would be done away with.

Mr. A. G. White, secretary of the National Federation, proposed the toast of "The Sunderland and District Building Trades Association." He remarked that he wished to bear testimony to the excellent and efficient way in which the business of the Sunderland Association was carried on. He complimented the association upon having a secretary of the ability of Councillor Hope. He mentioned that the Sunderland Association was going to send Mr. J. W. White next year as president of the National Federation. He hoped that Mr. White would have a splendid year of office.

Mr. J. Morice Wright, president of the association, responded.

The toast of "The Architects, Surveyors, and Engineers" was proposed by Mr. John W. White. Messrs. W. Milburn and J. W. Moncur responded.

Wigan.

The annual dinner of the members of the Wigan and District Building Trades Employers' Association was held at the Clarence Hotel on December 7th. Mr. Oswald Pilling, the president for the year, occupied the chair.

The President, in responding to the toast of his health, which was proposed by Mr. J. Smith, said he hoped that by the time of their next gathering they would all be in better spirits at the prospect of a revival in their industry.

Mr. Webster proposed the health of Mr. J. W. Bywater, the vice-president, who responded.

Councillor J. Walkden proposed the health of Mr. Dawson, the hon. treasurer.

Mr. R. G. Dawson, in acknowledgment of the toast, said that they were one of the finest associations in the Lancashire and Cheshire Federation, and he was proud to hold the office he did.

Mr. James Howard, who was called upon to propose the toast of the town and trade of Wigan, said that for the success of trade both masters and men find out the best way to advance the prosperity of the place they were living in. He thought they had a notice in for the advance of wages from the joiners now. A more inopportune time could not have been chosen. They had no trade in the town, and the contractors had to go to other districts to find work for their employees; they had to go to places where there was a much lower rate of wages. If the building trade of Wigan had to be carried on to any extent by competing with outsiders, they themselves would see that it was not a time for advance of wages. The masters had struggled manfully, and had very adverse circumstances to deal with, and they had never given notice for reduction of wages only as a counter notice. There was another little thing about the employees. The men they could not obtain work for were found doing work for property owners and others on their own. Whilst he said that they were perfectly right to earn an honest living, still they were breaking a compact between employers and employed. They pledged themselves not to work for any except a legitimate employer who had a shop with a rateable value. They were breaking their compact in that, as anyone could see in walking about. There was another injustice that they perhaps did not feel that they were doing their employers, that whilst these men had no rates to pay for their shops and no upkeep for their works, if they were working for an employer the work would be done, and they would be getting the same wages. They were acting to the detriment, not only of themselves, but of the master builders of the town.

Alderman Dickinson acknowledged the toast.

Mr. Wm. Johnson proposed "The Wigan and District Building Trades Employers' Association." He said he thought they could congratulate themselves upon being a successful organisation. There was no doubt that so long as things were as they were a considerable portion of the business of an organisation such as theirs would be to deal with notices for alterations of wages, and working rules, but there were other matters which to his mind were equally as important which in the past had not received the attention from builders' associations they ought to have done. They all knew that the whole trend of modern legislation was in the direction of putting handicaps and restrictions upon the conditions under which they carried on their business. There was a Bill introduced about two sessions ago which, if it came into operation, would make the building trade a considerably more difficult one than at present. It was a Bill to regulate the conditions under which buildings in course of erection had to be conducted, and a Bill that would affect every branch of the building trade in a very acute degree. It was put on one side because of the Budget, but he would not wonder if in future something of the kind would be passed. They would have Government inspectors going about from shop to shop, and they only needed to think of the carelessness of men in carrying out instructions given to them to recognise that there would be serious trouble for any builder if that act came into operation. He named that as an inducement to the young builders to take an interest in that association, because it was only by being organised that they could get anything like fair play. There was another matter, which was in respect to the architects. In Wigan they were on very good terms with their friends the architects, but there was one clause in every contract agreement, with regard to the retention money which they regarded as unfair. They all knew the length of time that elapsed between the completion of a building, and the clearing up of an account for the building was very much longer than used to be, and retention money remained without any interest being paid on it. The National Federation of Building Trades Employers were trying to come to terms with the Royal Institute, to insert in each contract agreement a clause that from the time of the completion of the building, or when the building was taken possession of, interest should be paid on the retention money. They would agree with him that that was a perfectly fair proposal.

Mr. Neville, M.P., and Councillor Glover, also spoke.

London Water Supply.

At an estimated cost of £6,900,000 the Metropolitan Water Board propose to construct extensive works in Buckinghamshire and Middlesex for the improvement of the London water supply. In addition the text of the Parliamentary Bill promoted by the Board includes provision for the execution of works under the general powers of the Board at an estimated cost of £1,000,000. The work to be done includes the construction of ten storage reservoirs—at Wyardisbury, Horton, Stanwell, Laleham, Sunbury, Wembley, and Staines—with necessary conduits and aqueducts. The water for service will be taken from the Thames and Colnbrook.

The Ruislip Competition.

THE competitive designs, sixty-two in number, which have been sent in for the laying out of the Ruislip Manor estate near Northwood and Pinner, have been on view this week in the large room at the Alpine Club. As stated in our last issue, the three premiums have been awarded, in order of merit, to Messrs. A. and J.

Soutar, Mr. George Hornblower, and Mr. H. R. Gardner.

The land to be dealt with has been sold by the Provost and Fellows of King's College, Cambridge, to "Ruislip Manor, Ltd.," on terms which, we are told, "will make it possible to plan and build a modern suburb for London on the most generous scale of town planning, with every amenity which new standards of housing demand." Railway access from London is ample and convenient. The spirit in which the Ruislip Manor Company are entering on the work may be stated in the following quotation from their prospectus:—

"The object of the company will be to develop the estate in accordance with those modern lines of development to which the term Garden Cities has been applied. All who are interested in the housing problem recognise that it is not enough merely to build houses which are structurally sound, and provide the minimum light and air spaces necessary to comply with the bye-laws. Something more is needed if the dull monotony of our suburban areas is to be done away with, and the lives of the inhabitants made pleasant and profitable. It is essential that playgrounds and other open spaces should be provided, and that everyone should be given the opportunity of having a garden of his own. Further, the directors are strongly convinced that new suburbs need not be divided into workmen's cottages on the one hand and villas on the other, in the way mostly adopted hitherto, but may be made to resemble our older towns and villages in being the homes of more or less organised communities; and they are still more firmly assured that such suburbs may, by careful planning, be made in their way as beautiful as an old cathedral town or the most picturesque village."

With all this we agree, except in regard to the idea, which has been promulgated also at the Hampstead Garden City, that it should be an object to mix the higher and lower class of dwellings, instead of having a quarter for villas and a quarter for cottages; and thus to make what is called an "organised community." What is precisely intended by this latter phrase we do not exactly understand; it appears to us that an estate laid out on that principle would be not more but less "organised," than one in which different classes of dwellings were separately grouped. The idea of mingling the dwellings of the richer and the poorer classes may seem very beautiful in theory, but it is contrary to our usual habits of life, and our impression is that the poor do not like it any better than the rich, and that they prefer to live among those of their own standard of living; and it is quite certain that most of the class who would pay the higher rents for the larger houses would also prefer to live in a quarter specially devoted to their class of residence. The point is of some practical importance to the company, for they may find the letting of the better class of houses impeded by this "organised community" arrangement, which they will find will not be generally acceptable.

The land to be dealt with is two plots, one of them a long rather narrow and irregular plot, nearly three miles long, the main axis of which runs northward, but rather west of north; the other is an approximately oval plot, about a mile long, the major axis of which nearly continues the major axis of the longer plot; the two plots are separated by some open fields, and the expanse of the Ruislip reservoir, practically a small lake about three-quarters of a mile in length. The land is rather suggestive for planning, as there is a general trend of the axial line in one direction, and the two plots, disconnected as they are, suggest a separate treatment.

Dealing with a site which is long and narrow, as the main plot is, it should obviously be an object to emphasise its longitudinal direction, to make use of this for long vistas, and not to break it up by too much cross treatment, which would interfere with the effect of its length. Moreover, an average north and south line for the direction of roads gives the best opportunity for light, east and west, to the houses flanking the roads. This principle is very well carried out in the first premiated design, which we reproduce, and which is one of the best plans for laying out building land that we have ever seen. The authors have a fine and effective backbone or central axis to their plan, and the longitudinal and northward tendency of the collection of roads is well maintained, so that the whole plan seems to lead up to a culminating point, and churches and other important buildings are effectively placed at the end of vistas. Above all, what we are glad to see is that there is none of that serpentine planning of roads in quasi-natural curves, which is supposed to be picturesque, but only betrays a want of purpose in planning. In this respect the plan is an immense advance on Letchworth, which in its main lines can hardly be said to be planned at all. The junction with the road leading off to the smaller plot is well managed by a circular lawn and road on which the road of communication hinges; and in the smaller plot itself we may notice the admirable placing of the two churches, facing each other at the ends of an avenue half a mile long. It will be seen, on looking over the plan in detail, that there are many points at which good architectural effects may be obtained. The only thing that seems rather doubtful, in a practical sense, is the position of the market, at the south end of the site. If this is a market for the general supply of the inhabitants, it would surely have been more convenient to place it in a more central position. We presume that the spot about the centre of the long plot, marked "Windmill Hill," is the highest point of the ground. The authors of the first premiated design have utilised it as the position of a reservoir.

Mr. Hornblower's plan (which we have reproduced side by side with Messrs. Soutar's) also preserves a good central axis, and is a good plan, but not open to so many effects in detail as Messrs. Soutar's, nor is it quite so comprehensive and unified in its general scheme. Mr. Gardner makes his principal axis run due north, which does not express the general trend of the ground; there are good points in it in detail.

In the general assemblage of plans we certainly did not find anything much to admire; the response has been a good one in point of numbers, but there is more quantity than

quality; many of the plans seem to amount to little more than an aimless scrawling of roads over the ground, and they are in many cases so badly got up and coloured that it is not easy to see what their authors actually intended. Among the few which show some definitely worked-out ideas is that by Mr. W. H. Thorp, of Leeds, who rather favours a scheme of taking large quadrangular plots for special laying out, with an oval space in the centre. Messrs. Cash and Starmer Hack show a grand central boulevard in a straight line from end to end of the large plot, with a fountain basin at each end of it, which reminds one of the Neuilly Avenue in the western suburb of Paris; this would have a fine effect. Mr. Ashbee's general plan is one of those which do not explain themselves, and it has rather the appearance of being unfinished, but he has made an effective treatment of the Windmill Hill centre as a circular garden, and shows a good bird's-eye perspective of it.

There can be no doubt that the first premiated design is decisively the best; it is really quite a work of art.

The Institute of Architects.

SIR HENRY TANNER'S paper at the Institute last week drew, as is not surprising, an unusually large audience. The fact that this was the largest work yet carried out in reinforced concrete naturally attracted many of the younger members of the profession, who hoped to get some useful information in regard to the practical working of the system on a great scale. The walls were covered with working drawings of various portions of the construction, which could be inspected before and after the reading of the paper, in addition to the illustrations by lantern views. It would have been useful, however, to have had some of the constructional diagrams photographed as slides, so that they could have been visible to the whole of the audience along with the description of them in the paper. The lantern illustrations were rather too much in the way of scenic photographs, showing in perspective the building in different stages of the work. Illustrations of this kind, which are often given in illustrated papers in connection with similar work, are more calculated to interest the "general reader" than to convey precise information.

An inspection of the interior of the building as now completely finished and in working order makes it evident that as an adaptation of reinforced concrete to the construction of a great working establishment, it is a brilliant success. Every detail in plan and arrangement seems to have been carefully thought out, and one cannot but be struck by the immense saving in space, both laterally and vertically, by the use of a material which can ensure adequate strength with such thin sections, and the general effect of neatness and efficiency combined. All this, of course, is not architecture in the higher sense; it is building—very efficient and practical building, but still no more than building. We quite agree however, in Sir H. Tanner's position, that the object in such an erection should be to produce a building exactly suited to its purpose, and let the architecture be adapted to that; and not to make an architectural design and fit the interior to it.

The architectural question remains, however, and is not solved in the new Post Office building, where the exterior architecture has no connection with the construction, except in regard to the clever way in which part of the weight of the masonry covering is carried on cantilevers in the upper portion of the building, so as to relieve the weight on the lower portion of the rather thin stone walls, besides acting as an efficient bond between the reinforced concrete and the stone covering. But this stone exterior has no architectural relation to the structure, and is only a rather ordinary application of features of Renaissance architecture. The higher note in the discussion was struck (as it often is) by Professor Pite, who hoped that in some such building in the future the reinforced

concrete construction would be carried through to the street and treated architecturally on a basis of its own. It would hardly be reasonable to expect that an architect of an official department, mainly occupied in producing an efficient building for a great branch of public work with as little delay as possible, should have had, or would even have been allowed, the time to consider and evolve a new architectural treatment of reinforced concrete—one of the most difficult architectural problems possible. But it ought to be done, and we are inclined to suggest that in another similar case it would be well to invite some architects outside the Office of Works, who have specially given their attention to artistic problems, to suggest designs for the exterior treatment. Two conclusions in regard to this subject may be laid down as absolute: (1) Crude concrete cannot be left as an outer wall, uncovered; it has too rough and unsightly a surface; it must be treated (in the materialistic sense) in some way; (2) any attempt to find the true architectural expression of concrete must be prepared for by the architect disembarassing his memory entirely of orthodox masonry detail, which is the expression of a material and a constructional method entirely different from reinforced concrete.

As a small matter of arrangement, it would be more businesslike, when lantern views are to be used in illustration of a lecture, that the screen to take the views should be in place beforehand, instead of the audience having to wait while it is let down in the middle of the proceedings.

Workmen's Compensation.

A VERY able article in the "Times" of December 29th reviews at considerable length and with great acuteness the present position of workmen's compensation in this country. The writer, who takes special account of the medical aspect, thinks that the principle of compensation is too firmly established to permit of any change except in the way of further extension. Changes must come, and probably they will come soon; but the writer thinks that they may be reasonably expected to follow scientific lines; and he believes that expansion, especially if combined with wider insurance out of a fund to which the workman himself contributes, might relieve, rather than multiply, "the burdens that at present alarm capital and hamper industry." He recognises that "the medical question is the key to the whole subject; the sifting of claims, the matter of *bona fide*, the complication of accident with disease, or the confounding of accident with disease, the duration of disability, its permanence or its limitation by treatment; these and many other matters complicate the discussion of individual liability and of the general application of the Act." He cites cases in which "an emphatic and possibly ill-informed witness combines with the benevolent judge to do a cruel injustice to the employer or his insurers." Again, "it is too often the case that workmen who are out for a lump sum settlement obstruct or neglect such treatment as would speedily restore them to work with undiminished competency; e.g., a man with an injured joint will deliberately permit adhesions to form and become organised, because he is obsessed with an extravagant idea of the compensation to which he is entitled." It is further declared that (as, we fear, many building trade employers could feelingly testify) "Many men will not attempt to work until they have been bought and paid for; they nurse symptoms and cultivate indisposition until the compulsion of the Courts, or the payment of a large sum of money, removes the premium on loafing. There is no difficulty in persuading the imbecile or dishonest doctor or lawyer to push speculative cases in Court, and they rely on the natural disinclination of judges to risk injustice to a workman whose livelihood is in jeopardy." He suggests that a workman should be compelled, as a condition of compensation being continued at full or partial rates, to produce a certificate that he was submitting to regular treatment to the satisfaction of an independent medical man,

THE NEW UNION GOVERNMENT BUILDINGS, PRETORIA, SOUTH AFRICA. HERBERT BAKER, F.R.I.B.A., ARCHITECT.

when the employer would probably be freed from the limitless liability of septic and preventable influences on wounds. Equally strong views are expressed as to the frailty not only of workmen, but of doctors and lawyers, in making the most of their opportunities for putting the screw on employers and insurance companies. The writer, however, is by no means narrow or bitter in his observations, but, on the contrary, appears to take a broadly humane view of all the points to which he directs attention. Thus he is very compassionate not only towards the employer who suffers in pocket from avoidable conditions, but to the workman who is physically the victim of the lack of proper organisation for the more economic administration of the Act. The patient should not only be more closely watched, but more efficiently treated and more quickly and effectively cured. At present the means for securing both these eminently desirable objects are sadly to seek, to the detriment of both master and man, with the result of much needless suffering on both sides, and of much waste of money, energy, and even life. We think that the National Federation of Building Trades Employers might very reasonably, in the interests of all parties, press for a Royal Commission upon the whole subject; and in furtherance of this object, they would probably obtain the support of the workmen's organisations, as well as of the combinations of employers in other trades; because, as the writer in the "Times" has so clearly and convincingly shown, the workmen are themselves as deeply concerned as the employers in placing the whole subject of workmen's compensation on a broader and more equitable basis. But the necessity for adopting a reasonable and conciliatory attitude cannot be too strongly emphasised.

The New Union Government Buildings, Pretoria.

THE new Union Government buildings at Pretoria are being erected on Meintjes Kop, which has been described as "an ideal Acropolis for a capital city." From the main axial line, with an inner radius of 138ft., has

been struck a semicircular block 34ft. in depth and screened on its southern sweep with a colonnade the height of the two upper storeys. On either side extends a block with a frontage of 305ft., and a general breadth of 138ft., while the horizontal range of this hill-set structure of 915ft. is relieved at the internal junctures by towers. The curved section is approached on its northward side by a high-level road that gives immediate access on to the first floor, upon which most of the Ministers' chambers are placed.

At the most northerly central point is situated a twelve-columned circular porte-cochère, some 36ft. in diameter, from which, after passing over a low-level roadway, a great triple colonnaded vestibule is reached. This, which is entirely open northwards and southwards, is in many respects the artistic climax and grand view-point, which, some 45ft. above the tram-line on the southern frontage, commands a full view of the axial features in amphitheatre, lawn, and water-stretches, roadways, terraces, and steps (and ultimately of piazzas and gardens, rich with statuary and typical products), and beyond to as much of the country as may be seen from an altitude of 4,565ft. above the sea level.

Taking the public roadway as the base-line, the structure will have a height of 61ft. to the eaves, and of a further 12ft. to the ridge. Two clock towers of stone, 30ft. square, rise some 160ft. above the general roof-line, or a total height of 160ft. from the level of the public road at the northern frontage. From the apex of each tower will rise a bronze figure some 10ft. high.

The end blocks, 148ft. from the axial line eastward and westward, are described as being "somewhat H-shaped," the lateral portions measuring 235ft. by 138ft., with transverse ends 208ft. by 35ft. The terraces are 35ft. wide and 17ft. above the public roadway. The central court to each of the end blocks has an area of more than 2,000ft. Giving relief to masses of red freestone are, on the lower floor, double columns, single on face, of finely wrought but unpolished red granite, while on the upper floors are triple

CARYATID BALCONY, BOULEVARD HAUSSMANN, PARIS.
H. GOURY, ARCHITECT.

columns, double on face, in one instance with arches, and in the other with lintels. Sections of lofty balustrading are introduced in the plain walling. Granite is used to the extent of 14,000 cubic feet. Balmoral freestone forms the superstructure. It will be rough rock-faced to the height of the ground-floor window-sills, and for some distance above that it will be hammer-faced, with boasted dressings; while the main entrance porches will have finely boasted faces with chiselled mouldings and dressings. Nearly all the surface treatment will be done by hand. The roofing design is remarkable. By means of ridge-flats, equality of slope has been secured throughout. The roofing overhangs the wall face some 5 ft., and "the whole result is a tremendous simplicity, allied with a very full measure of purposefulness."

Internally and externally there will be a good deal of sculpture, £20,000 being devoted to this object. The contracts for the eastern and western blocks (Mr. M. C. A. Meischke) amount respectively to £310,500 and £312,000; and Messrs. Prentice and Mackie's contract for the central block amounts to £256,224. Mr. Herbert Baker is the architect.

Wren's Scheme for Greenwich Hospital.

IN a finely illustrated article on Greenwich Hospital in the January issue of the "Architectural Review," Mr. J. Farquharson sets down a great many facts about the building which are not generally known, and gives a broad idea of the development of the whole scheme. The adaptation of the buildings as a hospital arose out of the Battle of Hogue (1692). Such a scheme lay very near Queen Mary's heart, but during her life little was done towards the furtherance of the scheme. At her death William III. reproached himself for his persistent neglect of the Queen's wishes, and at once took steps for the conversion of King Charles's Palace at Greenwich into a retreat for seamen. A Commission was formed, and Evelyn, Wren, and two others were appointed to report upon the practicability of Greenwich Palace Grounds as a site for a hospital. The result was a favourable one, and Wren submitted several designs, one of which was accepted, and the work of building commenced forthwith. It may be mentioned *en passant* that these drawings are preserved in the Soane Museum. Wren's post as architect was an honorary one, as he gave his fees in lieu of a subscription to the building funds. The portion of Wren's design then commenced was a replica westwards of the already existing pavilion of the river front of King Charles's Block, and the attic storey to the whole of this elevation was added at the same time. Soon after this, the dome, colonnade, and north and south elevations of King William's Block were begun, and the work proceeded so rapidly that these parts were roofed in, the dome erected, and the building so far completed that by the year 1703 accommodation had been provided for forty-two patients. Again, in the year 1698 the building of Queen Anne's Block was proceeded with. Of this, the river front and the elevation facing the Grand Square are exact copies of the corresponding elevations of King Charles's Block, and are the only façades of this block built under Mary's supervision. By this time Wren had become old and infirm. He pleaded inability to fulfil the demands of the work imposed upon him, and resigned his position of architect. It was Wren's desire to replace the Queen's House by a high and beautifully designed dome over a chapel, and to continue the colonnades on both sides up to the chapel. As Wren himself says in a report: The idea of these extended colonnades was to afford shelter to the patients in going to and from the chapel, while at the same time they would gather up the reins as it were of the grouping of the lesser masses. Had these designs been carried out, Greenwich Hospital would undoubtedly have formed Wren's masterpiece. Unfortunately, however, Queen Mary vetoed the proposal, and Wren had to give way to making the Queen's House the central feature of the composition. By this time he must have become resigned to the thwarting of his ideals.

In the January issue of the "Review" are also several other features of great interest; these including, among current architecture, some excellent photographs of the new reredos in the Chapel of St. Michael and St. George in St. Paul's Cathedral, designed by Mr. Mervyn E. Macartney; some drawings by Mr. Robert Atkinson and etchings by Mr. Frank Brangwyn, A.R.A.; illustrated articles on the gardens of Loseley Place, the public buildings of the United States, the Robert Fulton Memorial, and the plan of Karlsruhe; while in the "Practical Exemplar" series are given some measured drawings of Nos. 5, and 58, Lincoln's Inn Fields—a building in the manner of, if not actually designed by, Inigo Jones.

NOTES FROM PARIS.

The accompanying illustrations of three examples of modern French work serve to show the general character of design and refined detail characteristic of the majority of the important new buildings in Paris. With regard to the caryatid balcony in the Boulevard Haussmann, by M. Goury, it may be pointed out that very few attempts of this nature are wholly successful, despite the fact that the Erechtheum furnishes such an excellent type. In the majority of instances the figure is not happily arranged, having the appearance, more often than not, of being crushed down by the superincumbent mass; while the change from the human body into the base is rarely managed successfully. In the Paris example illustrated on the preceding page, the architect has avoided both these defects and has produced a pair of figures exceedingly graceful in appearance, crowned by capitals rich in design. Note should be taken also of the ironwork to the balcony, which is typically French. The ironwork, too, is a prominent feature of the façade to the house in the Avenue du Bois de Boulogne illustrated on page 28, and in the detail of the main entrance to the Crédit Lyonnais in the Rue Quatre Septembre shown by the photograph below. In both cases the design exhibits much refinement, the Bois de Boulogne example being particularly delicate and light in effect. In the Crédit Lyonnais the lions' heads recall a favourite feature, here treated with good effect. All three buildings are carried out in the soft white stone used so extensively throughout Paris, a stone that lends itself admirably to carving, as the photographs very clearly show.

The 1911 bureau of the Société Centrale des Architectes is composed as follows: President, M. Bernier, Membre de l'Institut; resident vice-presidents, MM. Ch. Dupuy and L. Etienne; non-resident vice-president, M. A. Louvet (Versailles); principal secretary, M. Destors, joint-secretary, M. Ch. Wallon; editorial secretary, M. Frédéric Bertrand; architect, M. G. Olive; treasurer, M. George; "censeurs," MM. Daumet and Girault, Membres de l'Institut; and M. Roussi.

MM. Feine and Herscher, architects, have prepared a scheme for the construction of a gigantic open-air amphitheatre for the gardens situated between the Tuileries and the Carrousel. The amphitheatre will not be raised, but sunk. There are to be colossal excavations, and the displaced soil will form the basis of the upper promenade and gallery, which will be approached by means of grassy slopes. The construction will be of reinforced concrete, and there will be accommodation for about seven thousand spectators. The Government's interest in the project is inferred from the acquisition of the drawings exhibited by the authors at the last salon of the Société Nationale.

The syndicate of contractors for public works have just held their general meeting and banquet. At the banquet, M. Philippe Fougerolle, president of the syndicate, regretted the Government retrenchments on public works. He pointed out that whereas in 1802 the sum of ninety-eight millions of francs was allocated to public works, the budget of 1911 allowed only eighty-four millions. M. Charguérand, representing the Government, was present at the banquet, and replied that in two years Parliament had voted 300 millions of francs for various public works,

notably for the ports of Havre, Dunkerque, and Nantes, and for the improvement of the course of the Loire. He contended, moreover, that during the past four years the relations between the public departments and the contractors had been considerably ameliorated—as, for example, by the institution of an arbitration commission, and by the submission of great works to competition. The banquet was followed by the usual distribution of medals to workmen, etc.

The Société des Architectes Diplômés par le Gouvernement has elected for three years' service on its executive committee the following gentlemen: MM. Defrasse, Godefroy, Duquesne, Guilbert, Tzakiri, Lisch, Drouet, Longfils, Dupézar, Hannotin, and Gontier. M. Thoumy was re-elected general secretary, and the executive bureau for 1911 comprises the following: President, M. Defrasse; vice-presidents, MM. Monduit, Godefroy, and Mougenot.

The various juries of the "Three Arts" competitions, Ecole des Beaux-Arts, have concurred in the following awards for architecture: First class: Second medals to MM. Grappin (pupil of Bernier), Pillet (Defrasse), Madeline (Deglane), R. Leclerc (Laloux), Nagoroki (Marcel Lambert). Second class: Third medals to MM. de Perrot (Deglane), E. Reverdin (Pascal), Quillard (Lemareshquier), H. Lacoste (Deglane), G. Dumail (Bernier), Prieur (Hulot), and R. Marteau (André). There are also numerous commendations in the two classes. It will be remembered that an example of the work of Deglane, who, like Bernier, has in this list two medallists to his credit, was given in a recent issue of this journal.

DETAIL OF ENTRANCE TO CRÉDIT LYONNAIS, RUE QUATRE SEPTEMBRE, PARIS. V. LALOUX, ARCHITECT.

A STANDARD STRENGTH FOR
BRICKS.

By ALFRED B. SEARLE

The increased interest taken by engineers in building construction, and the familiarity with figures which is a characteristic of many of the promoters of concrete, constructional steel, and other materials, has rendered necessary the employment of some kind of standard specification for bricks.

At one time it was sufficient if a brick was accurate in size and shape, and was of reasonable hardness, so that the user might assume it to be durable, but with the increasing spread of the "scientific method" into almost every department of business life, there has arisen a demand for some more direct and tangible expression by means of which the value of bricks from different makers can be compared.

For many years past the two tests which have been regarded as sufficient are the "crushing test" and the "porosity test." The latter is simply a measure of the amount of water which can be absorbed by the brick, and is not so much a test of quality as a simple means of classifying bricks, the porous bricks generally, though by no means always, being rather weaker than those which are more vitrified, and, therefore, less porous. The reason that this test is not really valuable, except as a preliminary, is that some vitrification may have occurred which is sufficient to bind the particles of the brick into a strong mass, whilst yet permitting a considerable proportion of water to be absorbed. Firebricks made of very rounded sand-grains show this phenomenon in a remarkable manner. For most ordinary building bricks, however, the generally recognised standard of a maximum porosity of 12 per cent. is sufficiently reliable.

The crushing strength of bricks is a matter requiring far more attention, and even then it is in many ways unsatisfactory as a standard test. Great care must be exercised in bedding the bricks to be examined, as irregularities in the bedding and in the distribution of the pressure, no matter how slight these may be, cause serious errors in the results of the test.

What is true in testing is also true in actual use, for whilst the crushing test indicates the maximum resistance to crushing when the brick is under the very best conditions, it shows nothing which is at all comparable to the pressures to which the bricks will be subjected in ordinary use. Thus in testing the whole of a pressure is exerted in a vertical direction, but an irregularly bedded brick—and in use no brick is perfectly bedded—is subjected to twisting strains which are not present in the test, and which material, reduce its actual strength. The latter has become the more urgent because the Continental makers of sand-lime bricks have found it necessary, in their own interests, to insist upon a minimum resistance to crushing of 1,988 lbs. per sq. in. Further than this, the German Association of Brick Manufacturers has, as the result of the work of a special committee of investigation, arranged the following standards, which are to be the minimum for the bricks mentioned. As this Association is a very powerful one, the effect of this decision will be far reaching:—

Minimum Crushing Strength for Standard Bricks.

Blue bricks, clinkers,
and paving bricks 4,970lb. per sq. in.

First-class building bricks	2,130lb. per sq. in.
Second-class building bricks or "commons"	1,420 "

These requirements are somewhat severe, as the following figures from tests made some time ago by Professor Unwin, will show:

London stocks	1,380lb. per sq. in.
Leicester wire cut ...	3,870 "
Gault wire cut	2,250 "
Red rubbers	1,200 "
Staffordshire blue ...	12,500 "

Prof. Unwin's tests were all made on picked bricks, and represent a better brick than the average in the class named, and many other published tests show much lower figures.

At the same time, there can be no doubt that some limit below which bricks should not be sold without special attention being drawn to the fact, is desirable. The difficulty lies in deciding what shall be taken as the minimum.

It is, of course, obvious that some classification is necessary, as otherwise some bricks of good quality will be ruled out of the market. Thus rubber bricks, as a class, would invariably be too weak for any general scheme of standardisation to include them as "common building bricks." But leaving out certain bricks which may be regarded as "special," there are bricks which are considered to be quite "normal" by their makers which are so weak as to come far below the German standard noted above.

Partially vitrified bricks such as blue bricks and clinkers are, on the contrary, much stronger in this country than on the Continent, if the available published figures are representative, and the German minimum crushing strength for this class of brick is therefore much lower than is necessary for Great Britain.

If any such standard became generally recognised, hand-made bricks would have to be treated separately, as they are usually about two-thirds of the strength of machine made bricks from the same clay, and fired at the same temperature, though it is difficult to understand so great a difference in the resistance to crushing between bricks made by hand, and those machine pressed, except that the latter are denser.

A new test, which is the subject of much consideration at the present time, consists in endeavouring to break the material by bending it. This test is very difficult to carry out, as it requires relatively thin pieces to be cut from the bricks, and the jarring action of the chisel when cutting these pieces so affects the bricks as to render the figures obtained on bending very different from those which result from bending a piece of the same clay which has been made to the correct size of test piece and fired under almost identical conditions. Yet, to use such a test piece is to run risks in the way of identification which render the manufacture of special test pieces impracticable.

The testing of whole bricks by bending is frequently carried out on small portions of brick wall, but the results obtained are of little value so far as the bricks themselves are concerned, as the mortar is always far weaker than the bricks, and apparently trifling variations in the brick-laying have a noticeable effect on the result.

At present but few results have been obtained, and these are by no means representative inasmuch as some firms are using the term "bending test for a brick supported near its ends and loaded centrally until it breaks (a difficult piece of work

to perform with any degree of accuracy), whilst others modify the test in many ways.

If properly carried out, there are several advantages in such a bending test, as it conforms much more nearly to the conditions in actual use, but the small size of the brick, its awkward shape, and its excessive thickness, are all against the present terms in which the test is carried out. There is at present more likelihood of the results indicating the resistance of the brick to cutting than to bending, and the former information is of little value.

Though there is no immediate likelihood of a satisfactory standard for bricks being found, there is every reason why those interested should not be misled and accept an unreliable factor as the basis on which to erect a standard, for unless accurate results which truly indicate what is needed are obtained, much hardship will result.

THE BUILDING TRADE IN
SOUTH AFRICA.

(By Our Special Correspondent.)

The building trade of South Africa continues good. Prior to the consummation of the Act of Union the Transvaal Government had in project an extensive programme of public works, and new schools, universities, police offices and barracks, Government buildings of every description, in fact, have sprung up all over the Colony. Ending up its financial year, prior to the entry into union, with a substantial balance in hand, it was decided to devote something like a million pounds to the erection of administrative offices for the conducting of the Union and service and other affairs in Pretoria, which was selected as the administrative capital of United South Africa. This immense job, together with others ranging in value from £140,000 downwards, brings the total of building works being carried out at the moment to something between three and four millions sterling. In the Cape, Natal, and the Free State, the trade is in a much better position than it has been for the last six years.

During the war and immediately following the declaration of peace, building went on at a rate never before seen in South Africa, and our chief towns were practically rebuilt. The inevitable attack of indigestion followed, and since 1903 a starvation cure has been operating. Indeed, so pronounced has the process been that many old-established firms had to relinquish business and seek for other fields of labour. Johannesburg might be taken as a fair instance of the slump. In the boom times following the war the monthly return of plans passed by the Municipality usually amounted to a quarter of a million—in fact in one year (1905-6) over three million pounds in plans were passed. These figures dwindled down and down, until in one month last year the unprecedentedly low figure of £16,000 was reached. This was zero. With the result of the Convention and the Act of Union came prosperity and belief in South Africa's future, and to-day we are in a nice steady prosperous flow of business. The above tale applies equally to all centres.

The Royal Visit.

The Duke of Connaught, who came out to open the first Parliament of United South Africa, is having a busy time. Ceremonies of all kinds have been left for His

Royal Highness to perform, and his tour through the country has been in every respect an arduous one. He has laid the foundation stones of the Union Buildings. These, each of four tons, cut from dark-blue Pretoria granite, are respectively inscribed in English and in Dutch. The ceremony, which was brilliant and impressive, passed off most successfully. (A description of the buildings appears in another part of the present issue.)

On November 29th His Royal Highness will lay the foundation stone of the new Town Hall, Johannesburg, a contract which will run into about £300,000. Extensive preparations have also been made for the Duke's visit to the Golden City, and a long programme of events commences with this ceremony.

Labour Troubles.

In the Transvaal there operates an Act of Parliament known as the Industrial Disputes Prevention Act, which was applied to the Building Trades in the early part of the year. The Act provides that before a strike or lock-out can take place, the cause of the trouble must first be submitted for investigation before a Court of Arbitration consisting of representatives from the employers and workmen, with an umpire appointed with the consent of both parties, or, if they fail to agree, by the Government. One court has already sat to decide on an application made by Pretoria bricklayers for an increase of wages from 2s. 6d. per hour to 2s. 9d. The decision in this instance has not been made known. Johannesburg operative masons are demanding an increase in wages from 2s. 6d. per hour to 3s., with a reduction in hours from 48 to 44 per week. The bricklayers in the Golden City are asking a rise in wages from 2s. 6d. per hour to 2s. 9d., while a similar demand comes from Krugersdorp bricklayers, who, however, hold their claim in abeyance until the settlement of the others. The prosperity in the building trade is the cause of the demands, and meanwhile the Transvaal Building Trade Employers' Federation is having a busy time. In a future letter I will refer further to this matter.

The message sent to the South African Federation by Mr. Smethurst, President of the British Federation, through Mr. Jas. T. Brown, General Secretary here, has created a most favourable impression, and South African builders are in hopes that they may receive a visit from a member of the home body. He is sure of a very hearty welcome.

FAILURES IN THE BUILDING TRADE.

The table of statistics compiled by "Kemp's Mercantile Gazette" shows that the total number of official failures in the United Kingdom last year was 9,054—the lowest number recorded for the last twenty-three years. In the building and timber trades the total number of failures was 961, as compared with 964 in 1909, 1,197 in 1908, 1,216 in 1907, and 1,202 in 1906.

"Certainly, with such returns before us, it is impossible to deny that there has been a general increase in the prosperity of the country, although there are probably some trades that have not shared in this all-round improvement. We find, indeed, decreases in failure everywhere, and the figures are quite encouraging.

"Except the building trades, which are always affected by financial views as to land and taxation, every kind of business appears—at least upon these official

figures—to have done much better during last year. These statistics, of course, are mainly affected by the state of our home trade, which may often be depressed, although our foreign trade is prosperous. It is, however, well to note that when there is less enterprise or speculation, which always come out in good times, there must necessarily be fewer failures. From this, it follows that a reduction in the way of insolvency may sometimes be caused by a cutting down of the credit that used formerly to be given, or by the adoption of more cautious methods of trading, with a tendency to do as much business as possible on a cash basis. In booming times, risks are run by traders and tradesmen which would not be considered in periods of sickness and depression. We can only deal with the figures of official failures as they are; and, taken alone, we must beware of drawing any conclusions that a wider and more complete view of the trading during last year might not completely warrant. Still, with the reduction of unemployment, and in other ways, there has probably been more spending power amongst most classes than was the case in 1908 or 1909, with the result of a decline in the general insolvency."

RECOVERING CEMENT FROM "EMPTY" CEMENT SACKS.

An interesting investigation has recently been conducted by a construction company of Boston, Mass., relative to the economy of treating empty cement sacks to recover cement adhering to them before bundling for return shipment. Instructions were sent to a number of jobs to have the man who was bundling the bags stretch each one over two sticks, mouth down, and then beat well. The cement was collected in a box. A careful account was kept of the number of bags shaken, the amount of cement saved, and the amount of the man's wages. Strength tests were made on the recovered cement, as it was probable that dirt or other foreign substances might be mixed with same. The total number of bags reported was 7,598; the amount of cement saved 4,130 pounds. The cost of shaking, bundling and tagging the above bags was 22.44 dollars, or about one-third more than the average cost of bundling and tagging without shaking. Hence the net cost of the cement saved was 7.48 dollars.

Comparative tests were made of the tensile strength of the shakings and of fresh cement from the same lots. An average of these tests showed a loss of 59 per cent. in strength after a 24-hour set, but a loss of only 35½ per cent. after a 7-day set. On the basis of this last figure, the 4,130 pounds of shaken cement is equivalent to 2,664 pounds of fresh cement. At 380 pounds to the barrel, there was an equivalent of seven barrels of fresh cement recovered. The average price paid for cement on these jobs was 1.41 dollars, so the value of the recovered cement was 9.87 dollars.

There is a further consideration, however, and that is the saving in freight on the cement shaken from the bags. The average freight paid for returning the bags from these jobs was 24 cents per hundred pounds, which would amount to 10.91 dollars on 4,130 pounds.

The total amount saved is consequently 20.78 dollars, which was accomplished with an extra expenditure of 7.48 dollars, the net saving being 13.30 dollars, or 17½ cents per 100 bags.

RUISLIP MANOR ESTATE COMPETITION.

Last week we announced the results of the competition for the laying out of Ruislip Manor Estate. Below are given summaries of the reports accompanying respectively the first premiated design by Messrs. A. and J. Soutar, of 37, Westover Road, Wandsworth, S.W., and the second premiated design, by Mr. George Hornblower, F.R.I.B.A., 2, Devonshire Terrace, Portland Place, W.

Precis of Messrs. Soutar's Report.

The principal considerations which have influenced the general arrangements of roads are as follows:—1. Convenience of access to all parts of the estate, together with ample provision for through traffic from all directions. 2. Economy in road making, both in regard to the widths of roads, and the careful consideration of the contours. 3. The planning of as many roads as possible running north and south so as to secure an ideal orientation for the majority of the houses. 4. A laying out has been adopted which, while affording ample opportunity for architectural treatment and interesting effects, would still be sufficiently "commercial" to secure financial success for the whole.

The scheme submitted could not be carried out in all its details under the existing by-laws of the Local Urban District Councils, but under the Town Planning Act application has been made by the local authorities for powers to modify these by-laws, and also to obtain means of access to the estates over adjoining land. The positions of these access roads were indicated in the conditions of competition, and have to a certain extent influenced the scheme of development.

With regard to the character of the roads generally, the probable traffic requirements have been taken into consideration; and where wide roads have not been considered necessary the distance between the frontage lines has not been reduced; the substitution of additional front garden in exchange for a needless expanse of macadam has now been made possible by the Town Planning Act; the consequent economy in road making and the corresponding reduction in rent being an added inducement to those about to build. Tram routes are suggested connecting up the various railway stations, shopping centres, etc. The geographical situation of the copse-wood area would suggest its being the most suitable in every respect for the larger class of house, and this point has been kept in view in distributing the types.

Plots Nos. 2 and 3, being for all practical purposes one area, have been considered the best site for the majority of the medium-sized houses (i.e., houses from £30 to £60). It is assumed that a large proportion of this type will be required.

The southern area, which is adjacent to the G.C. and G.W. Railway, would be the most convenient for the houses under £30 rental; the level nature of the ground being a consideration in the cost of erecting small cottages, while the proximity to the above-mentioned railway would make it a convenient situation for workshops, coal-yards, depots, and small industrial sites.

The rental value of houses on this area approximates the maximum in the more northerly and central portions of the areas and the minimum in plots adjoining boundaries. It is not suggested that

this proposed classification be rigidly adhered to, but it forms a general principle.

The indiscriminate intermixing of large and small houses is not recommended, but a judicious proportion of medium-size houses may be distributed among the larger ones without depreciating the value of the latter.

As a basis of calculation the following numbers of houses to the acre have been assumed :

Area No. 1	average 3 houses per acre (gross)
" No. 2	" 4½ " " "
" No. 3	" 8 " " "
" No. 4	" 10 " " "

Area No. 1, The Copse Wood.

The natural formation of this part of the estate has suggested the laying out indicated. The two wooded hills are a valuable feature in the landscape from the surrounding country, and an effort has been made to preserve this feature by leaving belts of copse on the slopes and crests of the two hills. These would form excellent natural parks, while enhancing the amenities of the estate.

The majority of the houses would be placed on the most level ground, while on the western slopes the larger houses might be situated nestling amongst the trees, which as far as possible should be preserved even on the building plots. The building plots on the slopes are kept single width, with all houses looking downhill; this has been done to secure economy in drainage as well as good aspect.

The central avenue is shown to have a 50ft. wide grass strip running up the centre, with a roadway 30ft. wide on either side. At either end of this avenue, and at a point where the ground is well raised above the centre, might be placed two churches. The one to the south would have a background of trees, and would form a picturesque and architectural terminal to the avenue.

A few large houses might be placed along the eastern boundary adjoining the golf course, which would form an open space as an amenity thereto.

Owing to the proximity of Northwood, it is not considered necessary that provision should be made for shops on this area.

A central situation on the bank of the reservoir has been devoted to the purposes of aquatic sports. This plot could be laid out as a pleasure resort, with a café, ornamental gardens, etc.

Area No. 2, The Park Wood, and No. 3, South of Park Wood and North of District Railway.

For the purposes of this description, Area No. 3 has been considered in conjunction with No. 2, of which it forms a part. The northern portion of this area is of a very hilly nature, and it has again been thought advisable to preserve the landscape as far as possible. The preservation of a portion of the copse would shelter the estate from the north, and afford an eminently suitable situation for a small cottage hospital or sanatorium.

A suggested architectural treatment is shown on plan for a collecting centre for all the main roads leading into the road connecting this area with Northwood and the copse-wood area. A site for a church and two sites for public buildings have been indicated in the above place.

A wide road leading from the centre of the "Place" at the apex gives a direct communication to the centre of the estate, continuing under the district railway by

the line of the existing bridge. Two other main roads lead out of this "Place," forming a triangle; the one to the west has its axis central with the tower of St. Martin's Church in Ruislip Village, while the other leads in the direction of Eastcote. A large recreation ground is suggested in the centre of this area, where the ground is level and suitable for games. Through the centre of this park would flow the river Pinn, which it is proposed to direct into a straight channel. By means of a large pool at the point where the Pinn enters the recreation ground, it would be collected and directed into a broad pond, narrowing at each cross road for economy in bridging. This divides the main recreation ground into four, each portion being large enough for cricket or football; these it is proposed should be used alternately, while the others are recovering from the effects of wear. The central position of these playing fields would be advantageous to the whole estate while absorbing the river Pinn, which is too shallow to culvert, and which, if treated as shown, would have an effective appearance, while it would retain its function of collecting surface and spring water.

At the intersection of the central avenue with the road between Ruislip and Eastcote a shopping centre is suggested. Further accommodation is provided on the existing road in Ruislip village.

A convenient situation for a garage could be obtained adjacent to the latter.

A site for baths and laundry is indicated adjacent to the river Pinn.

In addition to the existing school, further accommodation is provided. In this connection the existing accommodation in Ruislip, Eastcote, and Northwood has been taken into consideration.

Two sites have been reserved on the crest of Windmill Hill, which could be utilised for public buildings, such as fire station, public library, etc.

A wide belt of open space has been preserved on either side of the Metropolitan and District Railway, on which it is proposed houses should front. This would convey a pleasing impression of the estate from the railway, besides removing the houses to a reasonable distance therefrom.

Area No. 4, South of Railway.

Owing to the comparatively level nature of this area, and the fact that it has been chosen as the most suitable for the smallest class of property, a simple rectangular development has been adopted.

South of the bridge, the Central Avenue has been divided into two branches, each 40ft. wide, separated by a wide stretch of grass surrounded by trees, thereby providing the lower portion of the estate with ample recreation grounds easily accessible from any portion thereof.

Towards the centre of its length, this open space has been increased in width by the addition of two rectangular plots laid out as pleasure grounds, with bandstand and public shelter. The better class houses in this portion would be placed facing this open space, and the size of the houses would, generally speaking, decrease as they neared the boundaries.

To ensure direct access to the railway station at Northholt, all roads converge towards a collecting centre at the point where the river Yeading crosses the estate; and a main avenue, 60ft. wide, leads from this centre direct to Northholt Station. A shopping centre could be

provided at this point, near the railway station.

On the west side of the main road it would be possible to secure siding accommodation from the G.C. and G.W. Jt. Ry. which would greatly facilitate the delivery of coal, building materials, etc., on the estate.

The centre portion of the open space has been chosen as the most suitable for the schools, being practically equidistant from quarters. The school would be one storey high and the benefit to the health of the pupils by the free access of light and air to all parts of the buildings and playgrounds would amply justify the selection of this site for the purpose.

Convenient sites are provided for two churches.

In addition to the large open space aforementioned, a large number of smaller recreation grounds would be provided, so that all houses would have the benefit of a pleasant view.

The numbers of houses of varying rentals have been suggested as follows:—

Houses not exceeding £30 rental	3,556
" " " £60 "	3,541
" " " £100 "	524
" exceeding £100 "	21

Total number of houses 7,642

The following statistics may prove of interest as showing the large portion of land devoted to recreation:—

	Acres.
Area devoted to Building Plots	837
" " " Open Spaces	255
" " " Roads	184
Total Area about	1276

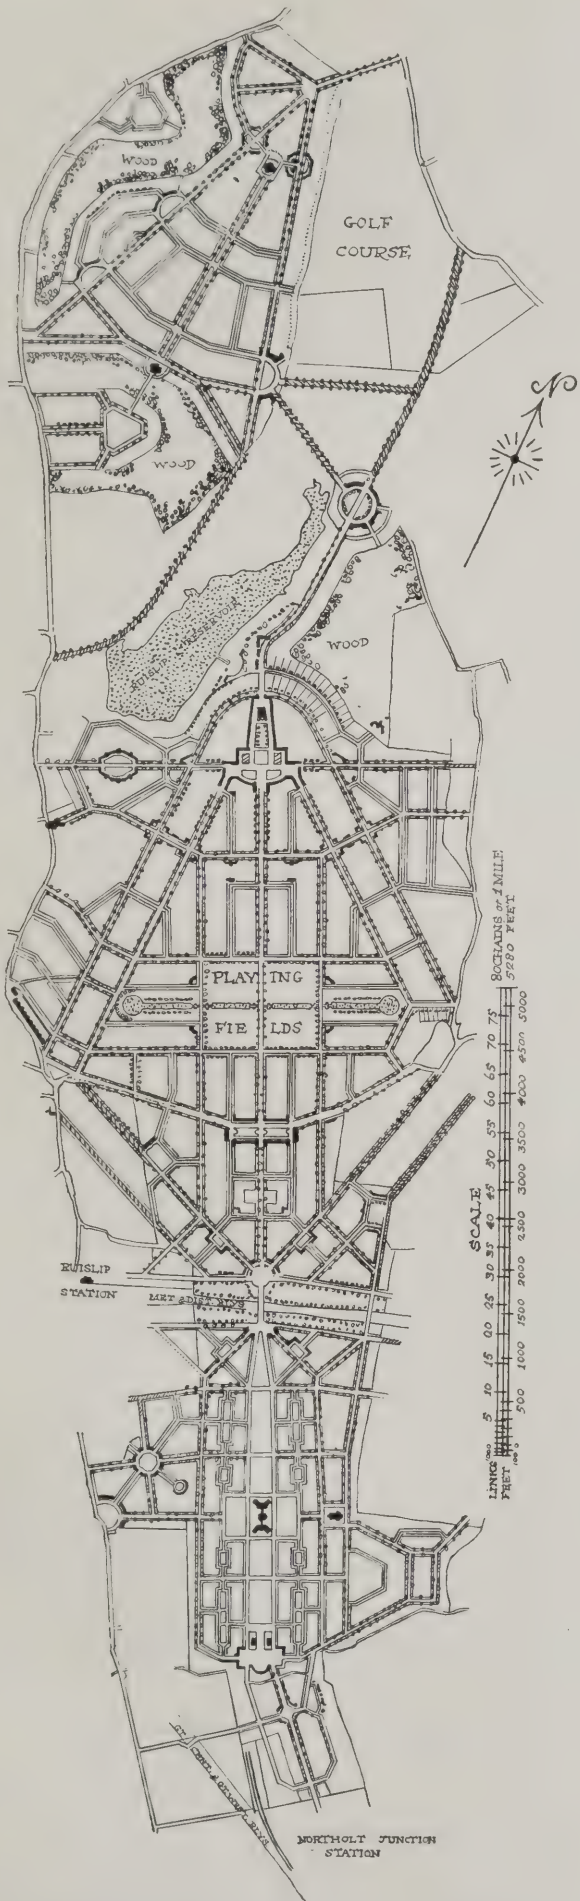

Precis of Mr. Hornblower's Report.

Open spaces are provided for both use and effect, whilst large playing fields suitable for cricket, football, etc., are in approximate proximity to the smaller houses, and open playgrounds where children will be within view of the houses. Adequate grounds are shown for croquet, tennis, bowls, etc., adjoining the sites for large houses.

It is felt that the retention of large unpolluted areas of woodland is undesirable, and likely to be a nuisance at holiday times. The alternative was consequently adopted of devoting the woodland areas to larger houses on larger plots, where the bulk of trees might be saved to preserve the character. Where land can be had on terms so favourable, plots 150 feet in depth can be afforded even to smaller houses, and none are shown less in depth. Comparatively little planting would be necessary along the roads; large parts of the site have well-grown timber which would be preserved.

Part of the Copse Wood area, owing to the small stream which traverses it and becomes swollen in winter, is unfit to build upon. A small park or ornamental garden is provided here. Considerable areas on either side of the river Pinn, and also on either side of the smaller stream near Northolt junction are liable to be flooded. These areas, with other land adjoining, are set apart as open spaces. The river Pinn is a considerable stream with the banks in parts prettily wooded, and would form an attractive feature in the park where, by an enlargement a lake could be formed as suggested.

The character of the higher ground, owing to undulations and beautiful timbering, should render it very attractive to people of means, and a strong effort

should be made to keep the building plots large. Obviously more plots than shown could be arranged without altering the scheme.

The factories and workshops are placed at the lower end of the site. The design of such buildings is being more and more studied and it is felt they need not be in-artistic. Instances could readily be cited of old as well as new which are suitable additions to the appearance of a town. Generally, however, they would especially need to be controlled as to design and treatment.

Economy in road formation has been a prominent consideration, as the following table shows.

	acres
Area devoted to building plots ...	994
„ Open spaces ...	*137
„ Roads ...	145
About total area	1276

*Already explained in regard to open spaces; large plots are allotted to superior houses where trees occur.

The roads are planned as far as possible to run North and South; the departure where a diagonal treatment gives direct access to Ruislip making the laying out interesting as well as useful. Convenience of access to all parts of the estate has been well considered, and as a means of transit electric tramways are suggested along the main roads.

The sites for places of worship are provided where due quiet should be secured. Shopping and business centres are arranged in central positions, including a desirable one for the Copse Wood area. Motor garages are needed in three or four places and suitable positions are indicated. Sites for public buildings, clubs, etc., are shown for convenience of access near the main avenue, and suggested tramways, and the positions for schools have been carefully considered.

Though it is possible to develop the estate without having recourse to a scheme under the Housing and Town Planning Act, a scheme under the Act is recommended.

Mr. W. Thompson, managing director of Ruislip Manor, writes to the "Times" to correct a misapprehension contained in a letter sent to that journal by Messrs. Reynolds and Bacon, who assumed that the winning design gives an average of nearly nine houses to an acre, instead of an average of six houses to an acre, as prescribed in the conditions. Mr. Thompson states that the assessors, Sir Aston Webb and Mr. Raymond Unwin, have strictly followed these conditions. The area planned by the authors of the winning design is 1,275 acres for 7,642 houses, or an average of six to the acre. The mistake is due, Mr. Thompson points out, to (1) the assumption that only two-thirds of the estate have been planned by the winning architects, whereas as a fact the whole estate has been included in the plan, and (2) that an average for the estate has been confused with a maximum for a specified area, which will, of course, only be settled under the general provisions of the town plan.

OBITUARY.

Sir John Aird.

Sir John Aird, who, having been for some time in failing health, died on January 6th at his residence, Wilton Park, Beaconsfield, Bucks, was born in London on December 3rd, 1833, and at an early age entered his father's business,

and was still in his teens when he was entrusted with a large amount of important work in connection with the great exhibition of 1851. Afterwards he was associated with the construction of many large contracts at home and abroad, such as gasworks, waterworks, railways, and docks. Among his most famous undertakings were the Assuan Dam on the Nile (1898-1902), and the Esneh barrage (1906-1909). He was M.P. for Paddington from 1887 to 1905, and was created a baronet in 1901; the successor to the title being his elder son John, who was born in 1861. The late Sir John was an ardent collector of pictures.

Mr. Thomas Cox.

The death is announced of Mr. Thomas Cox, head of the firm of brick and tile manufacturers, Messrs. Cox, Sons and Co., of Highbridge, Somerset. Mr. Cox was 83 years old.

At the last meeting of the Royal Institute of British Architects the decease was announced of the following members: F. W. Peel (Fellow); C. A. Callow (Associate); and F. W. Roper (Associate).

COMPETITIONS.

Proposed New University College for Southampton.

A proposal is on foot for the erection of a University College at Southampton for 400 students; the first section of the building being estimated to cost £20,000. Representations have been made to the R.I.B.A. with regard to the conduct of a competition for the design, and the appointment of an assessor. As a result, it is understood that Mr. Henry T. Hare, F.R.I.B.A., will be appointed as assessor. Formal announcements of the competition will be made later.

Church, West Llandudno.

The awards in this competition, in which Mr. W. D. Caröe was assessor, are announced as follows: 1, Mr. R. T. Beckett, Chester; 2 (£10), Mr. North, Llanfairfechan.

Manchester Library and Art Gallery.

A correspondent of the "Manchester Guardian," who describes himself as "a member of one of the oldest firms of Manchester architects, who have paid rates to the city for fifty years," writes protesting against the action of the Infirmary Site Special Committee in proposing to hold an open competition for the new library and art gallery, and claims that the competition should be confined to local architects. We are glad to note, however, that the "Manchester Guardian" does not agree with this view of the matter, our contemporary expressing the wiser opinion that an open competition is the fairest and most hopeful way of getting the best design.

International Telegraph Monument at Berne.

The following letter has been received by the secretary of the Royal Institute of British Architects from the General Post Office:—

"I am directed by the Postmaster General to inform you that no suitable design having been submitted in connection with the recent competition for the erection of a monument at Berne to celebrate the foundation of the International Telegraph Union, it has been decided to hold a further competition for which de-

signs must be sent to Berne by the 15th of August next. I am to enclose three copies of the programme for your information. From the report upon the recent competition made by the International Jury, who considered the designs, it appears that out of the 92 designs submitted, no fewer than 70 were either clearly inadequate or had no relevance to the idea which they were intended to represent. The Jury wish to emphasise the importance of fully realising the idea which the monument is to commemorate, and of submitting only such designs as could be carried out under the conditions set forth in the programme, and it is considered desirable that the attention of intending competitors should be specially called to these requirements."

The successful competitor will be entrusted with the execution of the monument, at a cost not exceeding 170,000f., all fees and charges included, with the exception of carriage expenses, Customs duties, and the cost of the foundation up to the ground level, which will be borne by the Swiss Federal Council. The jury will have at their disposal the sum of 20,000f. as premiums. Models must be deposited at the Federal Palace, Berne, before August 15th, 1911. British artists can obtain copies of the programme on application to the Secretary to the General Post Office, London, E.C. The British representative on the international jury is Sir George Frampton, 90, Carlton Hill, St. John's Wood, N.W.

Deplford Central Library.

Architects practising in the City of County of London are invited to send their names to Mr. Vivian Orchard, Town Clerk, Town Hall, New Cross, S.E., not later than 9 a.m. on January 18, stating particulars of any similar buildings that have been erected under their supervision. Twelve architects will then be asked to submit designs, and premiums of £50, £30, and £20 will be offered. The first premium, however, would merge.

RECENT ENGLISH DOMESTIC ARCHITECTURE.

The annual issue of the "Architectural Review" for 1910 devoted to recent examples of English domestic architecture furnishes a wealth of illustrations of great interest; ranging from houses of quite modest pretensions to large mansions in town and country. The illustrations are all from specially taken photographs, accompanied by plans and descriptive particulars, and are thoroughly representative of the best work which is being done in this country at the present time. The work of such well-known architects as Mr. Lutyens, Mr. Lorimer, Mr. E. Guy Dawber, Mr. Ernest Newton, and Mr. Walter Cave is included, and in addition are given many examples by lesser known architects, and architects who do not figure prominently in professional circles, though producing excellent work in a quiet way. The volume is issued at 5s. nett., and is excellently produced. As an example of the type of illustration contained in it, we give on the opposite page a detail of the main entrance to a house at Hampstead which has recently been completed from the design of Messrs. Ashley and Winton Newman, of Gray's Inn. This house offers many features of interest, not the least being the treatment of the brickwork, which is full of vitality, as, too, the leadwork on the building.

In this house the architects have displayed much ingenuity in the treatment of the brickwork. The above illustration is taken from "Recent English Domestic Architecture," some particulars of which are given on the opposite page.

MAIN ENTRANCE AND LEAD-COVERED ORIEL, "EAST WEALD," BISHOP'S AVENUE, HAMPSTEAD, LONDON.
J. H. V. ASHLEY AND WINTON NEWMAN, ARCHITECTS.

INIGO JONES AND HIS SUCCESSORS.

BY J. ALFRED GOTCH, F.S.A., F.R.I.B.A.

In the seventh of his series of lectures on "English Vernacular Domestic Work," delivered at University College, London, Mr. J. Alfred Gotch shows how, with the advent of Inigo Jones, there came a final severance from the spirit and the methods of mediævalism, and the beginning of the modern era.

ALL through the mediæval period, architectural design seems to have been impersonal, the result of a number of men working together, each concerned with the portion affecting his particular trade. It is probably true that some one individual controlled the general scheme, and gave an oversight to the work of the others; but not in such a sense as to have been entitled to be called "the architect" as we understand the term. To us the architect is the person who not only provides the plan, not only puts into practicable form the ideas of the employer, but also designs most of the details. He not only informs the various artificers that particular work is required in particular places, but he also provides them with drawings showing what the work is to be and how it is to be fashioned. His influence to-day is much wider and much more intimate than it was in the Middle Ages—the ages which produced our cathedrals, our ancient churches, castles, and manor-houses.

Modernity of the Term "Architect."

The term "architect" appears very seldom either in literature or in documents previous to the seventeenth century. Shakespeare uses the word only once; and in contracts of Elizabeth's time it occurs seldom, if at all, although the documents refer to the provision of design as well as workmanship. The word appears now and then in the numerous books published for the guidance of designers in building matters in the reigns of Elizabeth and James; but the appeals which these books made on their title-pages and in their pre-faces to those for whom they were written were addressed primarily to artificers, and only incidentally to architects, who seem to have been included in order to catch a possible purchaser. The reason is obvious: there were hardly any people who called themselves architects. The publication of these books is itself a sign of the change which was coming over the methods of design. Hitherto design had been a matter of tradition, preserved by guilds, handed down from father to son, or from master to man. The horizon of a mediæval workman was limited; he neither knew nor cared much for what was being done in distant lands. His style was influenced by local considerations; and although he conformed to the general changes which affected the whole of Gothic architecture, there was usually a local flavour about his work. The difference in character between the work in Norfolk, Northamptonshire, and Somerset is obvious at first sight, but a closer scrutiny will often reveal local variations in those districts themselves.

Early Books on Architecture.

Why were these books published, and what kind of architectural style did they illustrate? Did they bring before the eye of the designer masterpieces of Gothic architecture, or details of Gothic work? Not at all; no book illustrating Gothic architecture was ever published till the end of the eighteenth century. There was, in truth, no need for such a book. The mediæval workmen had their own tradi-

tional knowledge, and it concerned them not at all to learn how the workmen in Germany, or Southern France, or Spain, differed in their ways from themselves. They gave no thought to such matters, nor did they think of themselves as being concerned with architecture. They merely built, in the manner of their fathers.

The Italian Manner Introduced.

But although the successors of the mediæval craftsmen in the mid-sixteenth century shared their predecessors' apathy in respect of what was being done abroad, it was otherwise with those for whom they worked—the great men who were building fine houses all over the land. To these had come new ideas in relation to their buildings. They had heard of the splendid work that had for years been executed in Italy. Some of them had seen it; monarchs and wealthy nobles had even brought foreign craftsmen over to exercise their skill in the northern parts of Europe. The Italian manner was a novelty in this land of Gothic traditions. But the new fashion caught

on. Employers demanded the novel detail in their houses; but the foreign artists were not numerous, and so the English workmen had to supply the best imitation they could contrive on a scanty training. Here came the opportunity for the book-makers. They showed the way in which Italian buildings were designed; they illustrated the "Orders" which gave these buildings their distinctive character; they showed how Classic detail might be applied or perverted to meet the exigencies of buildings which had a Gothic parentage. The books, therefore, were published in order to help designers who aimed at working in the new Classic style.

The effect, of course, was to foster that style at the expense of the native Gothic. It is true that books were not widely distributed: there was not in those days the rapid dissemination of ideas that there is in our own. But if anyone wanted a book about building, he could only find such as dealt with Classic architecture. Thus it came about that in the course of half a century people of culture regarded all Gothic buildings—even the noblest—as barbarous, and not worthy of the name of architecture. The "Gothic Order," as it was called, was merely "a fantastic and licentious manner of building."

Architects Study the "New Style."

It was only a small proportion of the actual workmen who were able to study books; the rest picked up the new

STAIRCASE, CHELVEY COURT, SOMERSET.

manner from such foreigners as they met, from work which they saw as they moved about, and occasionally, perhaps, from oral description. Some worked all their lives on the old lines. One result of the difficulty of imbuing the workmen with the requisite knowledge was that some of the men whose duty it was to overlook buildings—the surveyors—made a point of studying the new style either through books or by foreign travel. They rendered themselves familiar with Classic detail, and were thus enabled to give the desired character to the detail of the buildings under their charge. They gradually became more and more responsible for design in the various branches of the building trades, and thus grew to be architects as well as surveyors. The inevitable tendency was for architectural design to become more personal, and for its results to become less like a spontaneous growth of the land.

English and Foreign Books on Architecture.

The number of architectural books published was not in reality very great; they were mostly of foreign production, and probably few copies found their way into England. The earliest were printed in Italy during the closing years of the fifteenth century. By the middle of the sixteenth century there were perhaps half a score in existence, some in Italian, some in French. These were obviously of no use to unlettered workmen, but they were appreciated by men of learning, and were studied by some of the surveyors of the time. By the end of the century, one or two Englishmen had produced treatises on architecture, but their direct effect on English design can hardly be traced. It is, indeed, unwise to look to any of the books of the time for direct and immediate influence; their effect seems to have been gradual. As may be supposed, it would be the illustrations which would have the greatest weight, for they would be intelligible to men unacquainted with the language of the text. The more important treatises confined themselves largely to drawings of the Orders, but a few smaller books, published by Germans and Dutch, gave many illustrations of particular features, such as doorways, windows, and so forth, and these appear to have appealed more powerfully to English workmen, and to have influenced in some degree the appearance which they imparted to their details.

De l'Orme and Du Cerceau.

In another and a different direction some of the French books would seem to have had an interesting effect. Philibert de l'Orme and Androult du Cerceau had published remarkably fine illustrations of the more important buildings recently erected in France. It is certain that John Thorpe, who was the most accomplished and ingenious of the English surveyors of the time, had studied Du Cerceau's books, and it is quite conceivable that, fired by such an example, he may himself have contemplated a similar production for England, and that to this idea is owing the very interesting collection of drawings now preserved at the Soane Museum.

But although we may perhaps see in the books of the sixteenth century the genesis of our own English architectural publications, their immediate interest lies in the fact that whatever was published about the beginning of the seventeenth century dealt with Classic architecture, and that anyone who sought in books for information about building found nothing about

the old Gothic detail, but only instructions how to design in the Classic styles.

Ancient Traditions and New Desires.

There were, therefore, two forces at work—ancient traditions on the one hand, new books and new desires on the other. The leader of the army was Inigo Jones, who had travelled in Italy for the express purpose of studying its architecture. He seems to have thought that if the new style was worth imitating, it was worth doing well; or rather, perhaps, we ought to say that he acquired new ideas upon the subject of architectural design, and, having saturated himself with the Classic spirit, devoted himself entirely to that style. He certainly was not a mere imitator. He was sufficiently touched with the ancient fire to make all his work highly original. It was consistent in

DOORWAY, CHENEY COURT.

treatment, and he eschewed all distinctly Gothic forms.

It was not so with the many obscure designers who had not had his opportunities. They were all more or less subject to the prevailing fashion, but their work shows a considerable admixture of the old-fashioned detail. In some remote places, indeed, and in buildings of no great importance, the style that had established itself at the beginning of the seventeenth century lingered on until the end. [Examples were shown from a farmhouse at Brockhall, 1677; Stapleford, Leicestershire, 1633; Chelvey Court, Somerset; Cheney Court; Cold Ashton, Wetherby; Houghton Conquest, about 1620; and Burford, after 1634.]

Inigo Jones and Italy.

What is interesting with regard to the work of Inigo Jones is that he went to Italy on two occasions—once at the end of the fifteenth century, when he was about twenty-five years old, and again in 1613, when he was forty. In the meantime he had been largely employed in designing the setting and scenery of the masques in which the Court of James delighted, an occupation which no doubt gave him

facility in designing in the round. During his second visit, which lasted some eighteen months, he studied the buildings of Italy with much care, and there is a volume of Palladio in the library of Worcester College, Oxford, which is full of his notes written on the margins.

He returned to England in 1615, fully equipped for architectural design, and almost at once obtained employment in high quarters. His most notable work was a vast new palace for the king at Whitehall, of which only a very small and subsidiary portion was actually built, namely, the banqueting hall. His designs for the palace are of great interest, but it would take us too far out of our course to study them at all closely. What is important to bear in mind now is that the Banqueting Hall, which is the most strictly Classic building prior to Wren's work, fifty years later, was built in 1622, some fifteen or twenty years earlier than the work shown on the screen as above-mentioned, which all bore traces of the disappearing style.

Authorship of Early Work.

It is very difficult to assign work with certainty to the masters of three centuries ago, and much of that attributed to Jones cannot be substantiated; but among the houses with which he is plausibly credited are Raynham Park in Norfolk, and Coleshill in Berkshire, of which plans and elevations were shown and described; as were also views from Kirby (1638-40); Reindeer Inn, Banbury; Harringworth House; Wilton House; the Queen's House Greenwich (1635); a house in Salisbury close, which is in a fine manner, and was the forerunner of many similar houses; and the garden front at Brympton, which is attributed to Inigo Jones.

John Webb, Jones's son-in-law and pupil, did much charming work, in which there was a considerable play of fancy, and a piquant handling of Classic detail.

Sir Christopher Wren.

The lecturer then gave a brief summary of the career and character of Wren, whose first architectural work was the Sheldonian Theatre at Oxford (1664-8), which is of ugly shape and crude in detail. In 1665 Wren went to France to study architecture, sketched most industriously, and brought back "almost all France on paper." He was not much concerned with domestic architecture, except in the form of palaces; but one of the small houses attributed to him is at Chichester. Other examples attributable to Wren that were thrown on the screen were The Deanery, Wells; Brewer's Hall, 1673; Hampton Court, etc. For comparison with Wren's work, some contemporary examples from France were shown.

In conclusion, the lecturer said that the magnificence of Elizabeth's days was tinged with homeliness; the magnificence of Queen Anne's time was much more haughty and exclusive. Later, considerable sacrifices of comfort were made for the sake of display.

Liverpool Custom House.

The Liverpool has decided not to accede to the request of the Liverpool Chamber of Commerce for the erection of a more centrally situated and conveniently appointed Custom House near to the offices of the Mersey Docks Board. This decision was made known at a meeting of the Chamber of Commerce held last week, when the greatest disappointment was expressed.

NEWS ITEMS.

Lectures on Cement Manufacture, etc.

On the invitation of Professor Hopkinson, of the Engineering Department of the University of Cambridge, Mr. A. C. Davis, of the Saxon Portland Cement Co., Ltd., is lecturing on the manufacture, testing, and uses of cement, and on theoretical and practical concrete engineering.

Reinforced Concrete Sleepers.

About a quarter of a mile of the London and North-Western Railway Company's "up" line immediately north of Pinner Station has been laid with sleepers formed of reinforced concrete. These sleepers are placed somewhat closer together than those made of timber, and, except where the chairs are placed, are of smaller section. It is understood that if the experiment shows satisfactory results, the use of reinforced concrete for the purpose will be extended.

The Wolfe Statue.

The bronze statue of Wolfe which has been erected in the market-place of his native village of Westerham, Kent, was unveiled by Field-Marshal Lord Roberts last week. The statue, erected by public subscriptions collected by the Wolfe Memorial Committee, is the work of Mr. F. Derwent Wood, A.R.A. Wolfe is represented as he appeared, with his sword uplifted, and in the act of moving forward, just before he received the bullet from which he died in the moment of victory on the Heights of Abraham. The figure, which is nearly 8ft. high, rests on a block of Portland stone.

Birmingham Town Planning Scheme.

At a Local Government Board inquiry held in Birmingham last week, the City Council applied for authority to proceed with a town-planning scheme. The area included in the scheme is of 2,320 acres, in the parishes of Quinton, Harborne, Edgbaston, and Northfield, and the land is chiefly agricultural. Forty landowners are concerned, their estates being very much intermixed. The City Council thought it necessary that a definite and comprehensive scheme of town planning should be prepared before the land had been built upon.

* * *

Southwark Cathedral Scheme.

In order to improve the entrance to St. Saviour's Cathedral from London Bridge Approach, it is proposed to construct an

arch and flight of steps from London Bridge over a footway into the cathedral grounds. The works committee of the Southwark Borough Council report that the adoption of the scheme would effect a desired improvement in the approach to the cathedral. The committee, however, regret they are unable to see their way to make any contribution towards the cost of carrying out the scheme.

Building Trade Unrest at Nottingham.

Although labour trouble rumblings in Nottingham recently have happily passed over without involving anything serious, the outlook at the opening of the New Year is by no means bright. There is decided unrest in the local building trade, the old question of walking time having again come forward in an acute form. A beginning was made last week with the bricklayers' new arrangement, under

which their pay for walking time will be discontinued, being compensated by an increase of a ½d. per hour in wages. The builders' labourers on the other hand are losing their walking time pay without any difference in wages. They are taking up a determined attitude, and as they appear to have the sympathy of other workers there are signs of a very serious disturbance to local trade unless an amicable settlement is effected.

Extension of the Italian Hospital.

On Saturday last the Italian Ambassador formally opened the addition which has just been made to the Italian Hospital in Queen Square, Bloomsbury. The new buildings occupy a site formerly covered by two houses in Devonshire Street. They have been designed by Mr. J. D. Slater, of John Street, Bedford Row, the builders being Messrs. Roome and Co., Basinghall Street. The addition consists of a small block with basement, ground floor, and three upper floors. The basement will be used for the laundry, mortuary, and post-mortem room. On the ground floor will be the dispensary and ophthalmic department, and accommodation for nurses and others is to be provided on the other floors except the second, where the operating room will be situated.

Royal Academy Elections.

The forthcoming elections at the Royal Academy, says the "Morning Post," are causing considerable excitement in St. John's Wood and Chelsea. On the 25th inst. an Associate-Engraver will be raised to full rank for the first time since 1881, the year when T. O. Barlow secured similar honour. There are only two Associate-Engravers, Mr. Frank Short and Mr. William Strang. If Mr. Strang is elected he will be the eighth Academician Engraver, and the third who has won recognition as a painter; the others are Bartolozzi and James Ward. On January 25th also two ordinary Associates will be made, and two more on the 26th, as well as an Associate-Engraver. Two men have good claims: Mr. D. Y. Cameron, a painter-etcher of great distinction, and Mr. Muirhead Bone, a draughtsman-etcher of outstanding talent.

THE NEW GENERAL POST OFFICE.

BY SIR HENRY TANNER, I.S.O., F.R.I.B.A.

In his paper read before the Royal Institute of British Architects on Monday, January 2nd, Sir Henry Tanner gave a detailed description of the most noteworthy Post Office building in the kingdom. As he remarked at the outset, this building has been the subject of numerous articles in the professional and general Press. This journal has already dealt with the subject in considerable detail, and therefore the following extracts from Sir Henry's very complete account consist mainly of his observations on points that appear to be of special interest.

WHEN the first sketch plans for the new building were under consideration, Sir Henry inspected several examples of reinforced concrete construction, with the result that he came to the conclusion that the system was excellently adapted for the purpose of this building, and would economise both space and money, having in view the fact that Government buildings are exempted from the operation of the London Building Acts, and, therefore, full advantage could be taken of the new methods. Upon going into the matter of cost as carefully as possible, he found that for building in the ordinary way, with steel construction, the approximate cost, exclusive of fittings, etc., would be £355,000, but with reinforced concrete, £295,000 would probably suffice. The latter figure has proved to be correct, so that there has been an approximate saving of £60,000; and, apart from this, considerable space has been gained due to the great reduction in wall thicknesses. The cost per foot cube of the reinforced concrete structure was about 2½d. The sum of £295,000 is exclusive of engineering work, such as heating, lighting, lifts, telephones, conveyors, etc.

General Requirements.

In arranging preliminaries with Mr. Mouchel, representing M. Hennebique, Sir Henry stipulated that the columns were to be as few and as small as possible, in order to give the largest practicable unobstructed areas, that the beams were to be of a minimum depth, that the eastern platform was to be unobstructed by columns, that there must be a bridge connecting the two buildings at the second floor level, and that two subways were to be constructed under King Edward Street, connecting the new building with those existing. He arranged the superloads at 1 cwt. for the ground floor, and ¾ cwt. for the remaining floors, 65lbs. for the roof, and the factor of safety at 4. These superloads were arrived at after experiment. The north road was to be constructed to support a lorry with boiler weighing about 20 tons in all, and the remaining roads to support motor vans. The superload in the latter case was taken at 2 cwt. per foot superficial. Exclusive of engineering details, about 1,000 drawings were used.

General Description.

The building has two storeys below the ground, and these extend the whole length, including, therefore, the space under the eastern loading yard. The dimensions of the basement are 446ft. by 210ft., those of the sub-ground floor being slightly less. The general constructional arrangement of the sorting office or main block is that the principal beams run from north to south, and the subsidiary or floor beams from east to west, that is, the long way of the sorting office. The former are of arched form, and have a very light appearance. There are two open areas for light above the ground floor, and these have governed the disposition of the columns. There are five spans across the building, north to south, four of 35ft., and a centre one of 45ft., while in the other

direction there are seven of 34ft., one of 40ft., one of 21ft. 6in., and a cantilevered span of 12ft. 6in. at the east end.

The columns are square, and all are sheathed with steel to a height of 4ft. to take the impact of trucks, etc. They stand on reinforced concrete slabs about 13ft. 6in. square, which are in nearly all cases on the gravel. At the north-west angle, however, clay was found at a higher level, the gravel disappearing. The slabs are reinforced with bars ¾in. diameter placed at 8in. centres, and crossing one another, and are further reinforced with a mesh of smaller diameter bars at various levels, and stirrups.

The street and return fronts being constructed of stone, and it being impossible to include these in the first contract, the floors were supported by light pillars, which were afterwards built into the brick backing to the stonework. Reinforcing rods in floor slabs were left projecting in order to tie in the brick and stonework. The upper floors were constructed similarly to those of main block, but steel bars and expanded metal were used below the beams to give flat ceilings. The stairs in this part of the structure have treads, risers, and paving to the landings of York stone. Externally the concrete walls were covered with a thin rendering of cement, practically applied in one coat, as the

skimming was not allowed to dry before being finished with a wooden float. This rendering was gauged in the proportion of 1 cement to 2 of sand. It would have been better with a larger proportion of sand. The tendency for hair cracks to appear seems to increase with the strength of the mixture. The projections had been roughly formed in concrete. The cornices, however, were cast in moulds (*in situ*), the faces of which had been sanded; the modillions were cast down with steel rods projecting from them for attachment. These were laid in the moulds and the cornices cast upon them.

Arrangements for fixing casings for wires, lifts, guides, etc., were carefully considered, and many thousands of wood plugs left in the concrete as the work proceeded; but in many cases engineering requirements were afterwards altered, and the architect's experience on this building led to the conclusion that much expense would be avoided if such work were left until the engineering contractors appear on the scene and the necessary holes cut where required by them.

Cement Tests.

The cement used had to be superior to the usual British standard quality. It had to pass through sieves of 14,400 meshes per square inch, leaving only 10 per cent. residue; while briquettes were to break with not less than 500 lbs. per square inch after seven days, 600 lbs. after fourteen days, and 650 after twenty-eight days; and when made with 1 to 3 of sand, 130 lbs. for seven days and 200 lbs. for twenty-eight days. The average results of the tests were considerably higher than the specification demanded, being 587 lbs. and 702 lbs. for neat cement, and 196 lbs. and 276 lbs. with sand at seven and twenty-eight days

NEW GENERAL POST OFFICE, LONDON: FACADE TO NEWGATE STREET.
SIR HENRY TANNER, I.S.O., F.R.I.B.A. (H.M. OFFICE OF WORKS), ARCHITECT.

respectively. There were also tests by boiling. The specific gravity was not to be less than 3.10. Thames ballast was used throughout.

The second contract consisted of the Portland stone and granite work, and the third contract the remainder of builder's work, including internal brick divisions, joinery, plastering, tiling, sanitary work, painting, etc. These two contracts were also carried out by Messrs. Holloway Bros.

Architect and Engineer Co-operate.

Having had experience of several methods of procedure in regard to reinforced concrete work, the author could come to no other conclusion than that the method pursued in this case is by far the best. It is of the greatest possible advantage that the architect and the engineer should be able to work together, and this cannot be done when designs and tenders are called for. Besides, it is obvious that with such procedure if the engineer and his contractors are to hope for any success in competition for work, the steel and concrete must be cut down to the minimum, thus increasing the chances of failure. Much time is lost in the necessary examination and comparison of the designs submitted, and this, with vacant sites, means the loss of more or less money. Such a course is not taken with ordinary steel construction, and it is not usual to ask architects for designs and tenders, which would practically amount to the same thing. Moreover, under such a system, it is impossible to obtain a satisfactory schedule from which variations can be properly valued. The time must come when reinforced concrete will be incorporated in the ordinary bills of quantities and dealt with in the same way as any other part of the construction, and there are now any number of contractors quite able and willing to undertake and to carry out such works in a satisfactory manner.

With regard to materials, cement can now be regularly obtained to take a stress of 20 per cent. greater than the British standard, and Sir Henry could not see why this should not be taken into consideration. Such cement has been used throughout this building and in the test blocks.

The construction of the false work should be of a substantial character, so that no movement takes place under ramming, otherwise concrete partially set may be disturbed.

In regard to expansion and contraction, these were only observed when the building was considerably advanced, but without windows and internal warmth, and therefore entirely exposed to the outside temperature. In January, 1909, there was a severe frost, and contraction was evident at the eastern end of the bridge, and in the sub-ground floor at the rear of the front building, but on the return of warmer weather the fractures closed, and have not caused any trouble since the building has had the windows in and been otherwise protected. No special provision was made for expansion and contraction, and no movement has been observed in the area of floors.

Supervision is of the first importance, and three clerks of works were employed during the greater part of the time.

Discussion.

Sir Matthew Nathan, proposing a vote of thanks, referred to Sir Henry Tanner's connection with the Office of Works for the last forty years. Twenty-five years

had now passed since he designed the Post Office at York. Sir Henry's excellent planning was observable in the building occupied by the Postmaster-General, and the building known as Post Office North; and it was evident also in the Mount Pleasant sorting office, and in the block for the Savings Bank at West Kensington. Referring to the new building in Newgate Street, the speaker commended the boldness of applying reinforced concrete to a bigger construction than it had been adapted to in any other country. In the year 1888 he (the speaker), when an assistant engineer at the Works Department in India, had been called in to construct a battery at the mouth of the Rangoon River. In the concrete raft he embedded a number of contractors' rails, which acted as a reinforcement to the concrete. This method, of course, was very different from that described by Sir Henry Tanner, but the principle was the same.

Mr. Searles Wood alluded to Sir Henry's courtesy in permitting architects to inspect the building during course of erection.

Professor Beresford Pite said they felt as a body that the interests of the nation were in entirely satisfactory hands when under the control of Sir Henry Tanner; and while they were amused at the liberties taken with the Building Acts, they had never felt any doubt as to the ultimate success of the experiment. The future, he was assured, would go back to the building as a landmark in construction. With regard to a technical point, would not the possibility of the expansion of homogeneous building be somewhat serious? Sir Henry spoke of trouble of this kind, but said that it had not subsequently reappeared. Having referred to the precautions taken against expansion in London Bridge, would it be possible, continued the speaker, for expansion to take place without splitting the building? In the new building, refinement of outline had not been entered into—indeed, it would have been artificiality had it been there.

Sir Aston Webb observed that Sir Henry's perfect revelation of the changing of the ways must revolutionise all ideas of building construction, and they were greatly indebted to him for the information. This form of construction necessitated the same treatment of the street frontage as the general body of the building, and he hoped Sir Henry would show how concrete building could be honestly turned into an architectural success.

Mr. Max Clarke observed that Sir Henry, having a free hand, could do what others dared not do unless constructing a Government building. The cost of the concrete bedding was stated in the paper to be 2½d. per ft. cube, but he had since obtained from Sir Henry the admission that this was the cost of the ferro-concrete work by itself. The total cost was 7½d. altogether, and remarkably cheap building. But why did Sir Henry adopt a calculation with regard to cement different from the Standard Specification? The building had been built outside the Standard Specification, and had no reference to it. He would like to know whether the concrete was put in "wet" or "dry." An extraordinary amount of care had to be taken to prevent chips of wood and shavings from mixing with the concrete. The Kodak building in America collapsed through wood getting into the columns. Supervision, therefore, was very essential to the safe construction of reinforced concrete.

Mr. Ernest Franck desired to know whether the front was related by rods to

the floors themselves, or whether a separate foundation was provided at the basement. The cement used, he continued, as clearly shown by tests, was of considerably higher efficiency than that of the British Standard Specification. Referring to the point raised by Professor Pite, the speaker said that the building had been designed so that no fear of expansion need be entertained. Sawdust and shavings could be easily washed out with a hose. The failure of the Kodak building was due to the presence of large blocks of wood, and could not be attributed to sawdust or shavings.

Mr. Meik, in the course of a few observations, declared in favour of a face rendering of a 2—1 mixture of cement and sand, as pure cement was more apt to contract.

Professor Adams said he noticed that the beams across the first and ground floors were arched, but the end arched beams had no abutment. So far as his inspection had gone, this was the only constructional flaw.

Mr. H. H. Statham said that during an inspection of the building only that morning he had noticed, among other things, the architectural treatment of the loading yard, where the modillions of the cornice were of reinforced concrete and resembled those in the stone front. This, he considered, was not a satisfactory application of the material. One of the arched beams, he had noticed, had no abutment. Were these beams really acting like an arch and exerting a thrust? He doubted whether the arch added anything to the strength of the structure.

Mr. De Vezian observed that expansion and contraction had necessarily to take place, and in the G.P.O. building it occurred within itself. In a large warehouse in Manchester had been constructed a roof 2,020 ft. in length which had never given any signs of expansion. They need not, therefore, anticipate any troubles arising from changes in the temperature. The arched beams exerted no thrust upon the columns—they simply acted as continuous beams, and there was no need for abutments.

Mr. Leonard Stokes said that although Sir Henry worked under advantages, the work could quite possibly have been brought to a less successful termination. Ferro-concrete, he believed, carried sound, and on this account would probably be found disadvantageous for domestic work. The chimney wholly in reinforced concrete interested him, as the only other example of which he knew had cracked by the heat and had given considerable trouble.

Sir Henry Tanner, replying, said he could take little credit for the reinforced concrete work, which was entirely the design of the late Mr. Mouchel. The reinforced concrete beams were constructed as cantilevers. The alterations in the Building Act would, he thought, enable architects generally to erect reinforced concrete buildings similar to the new G.P.O. If structures erected in this material were large, they would pay, but if small they were not worth doing. Where floors were intended to take a load of 2 cwt., they had easily taken 9 cwt., with perfect safety, the utmost deflection being one-thousandth part of a span. He preferred concrete to be put in "dry," but it could not always be done. The stonework was on no special foundation, but all related to the reinforced concrete work. No trouble had been experienced with respect to sound; the floors were all covered on top with wood blocks, and in the front block were false ceilings.

HYGIENIC PLANNING OF SCHOOLS.

BY PHILIP A. ROBSON, A.R.I.B.A.

In the Journal of December 23th, p. 667, we gave, under the heading, "The Preliminaries of School Planning," an abstract of the first portion of Mr. Philip A. Robson's paper on "The Hygienic Planning of Schools," read before the Royal Institute of Public Health. The remainder of the paper, dealing with important details of the subject, appears below.

General Planning.

In order to plan with certainty, the architect requires to know (1) the numbers in the proposed school; (2) how divided, that is, the number of departments, and into what sized classes; and (3) if possible, the desirability of more than one floor or étage. As regards numbers, and their subdivision, the Board of Education does not now approve of schools larger than from 1,000 to 1,200, except under special circumstances, though that fact is not clear from the current Code, which speaks of departments of from 350 to 600 places, leading one to suppose that a school of about 1,500 scholars in the usual three departments was not an uncommon occurrence.

A point which affects the planning is, whether children under five years of age are admitted. Personally, I consider they tend to disorganise the proper work of the school, and some separate building should be provided for these infants in districts where they cannot be dealt with at home.

Classrooms.

The next point is the number of children in each class-room. I believe from forty to forty-eight will be found the most suitable, but, for the sake of elasticity, perhaps one or even two rooms for thirty-two

only might prove advantageous. Whether these are for mixed classes, or for boys or girls separately, does not affect the point. A class-room for forty-eight will consist of six rows of four dual desks, each being 3 ft. 4 in. wide, and having a gangway between each of 1 ft. 4 in. Thus we get four 3 ft. 4 in., and five 1 ft. 4 in., or 20 ft. for the width of the room by 24 ft. long, allowing 10 ft. of area per child, or 480 sq. ft., which is the Board of Education requirement. This room must be 13 ft. high, which only gives 130 cubic feet per child. The author did not regard this as sufficient, and deals with the cubic-content unit later. It may be noted *en passant* that this 10 ft. per child used to be 8 ft., and it was considered a great step to have put behind us the then accepted area of 6 ft. per child as held in Berlin. It took years of struggle to get that 8 ft. increased to 10 ft.—which it now is—with the exception of infant rooms, which are passed at 9 sq. ft. per child.

In elementary schools, the class-rooms should open directly from the hall, unless it is desired to follow the French plan of placing windows on both the right and the left side of the scholars—on the left for illumination mainly and on the right for ventilation.

It is a wise piece of planning to provide an occasional desk accommodating three pupils instead of the usual two. This enables a little elasticity in numbers to be placed at the command of the teacher which he will find valuable in practice. When the class is crowded, all three seats would be used, or as many as may be necessary. If a single desk be used, it is best not to place it next to the window-wall (the lighting is bad there unless the window sills be very low), and it should be kept 6 in. away from any wall. A gangway of at least 12 in. is necessary against the back wall—partly for a passage-way and partly to prevent the children from damaging the jointing of the glazed bricks or the hard cement dadoes preferred by some authorities. The seats need not be placed on stepped platforms, but then the teacher's desk should be raised on a dais.

These areas per child are graduated according to age: 9 sq. ft. for infants; 10 sq. ft. for children up to about 16; 17 to 18 sq. ft. for scholars in secondary schools. Obviously, therefore, either the 10 sq. ft. is too little or the 18 sq. ft. too much. Why must a boy of 16 live in a room and occupy the space of 10 sq. ft., and when he is 17 be suddenly advanced to occupy 17 to 18 sq. ft. instead of 10?

The author suggested a further graduation from a minimum of 10 sq. ft. up to a maximum of 16 sq. ft., which is ample for any hygienic reason which may be advanced.

A cubic unit is a more difficult matter to determine. The usual unit in German and American schools is about 164 cubic ft. per child, so that with 14 sq. ft. per child

DETAIL OF CEILING IN ROOM ON FIRST FLOOR, H.M. OFFICE OF WOODS, FORESTS, AND LAND REVENUES, WHITEHALL, LONDON. JOHN MURRAY, F.R.I.B.A., ARCHITECT.

and a room 12 ft. high, we get 168 cubic ft. per child, which is 4 ft. more than the American or German average, but less than the Canadian. It might be wise to limit the distance of the furthest child from the window by stating that *the centre of the desk furthest away from the window shall not be more than one and two-third times the height of the room distant from the inside of window wall in the absence of supplementary light.*

This consideration naturally turns attention to the

Lighting of Class-rooms.

Undoubtedly there is a tendency in the present age to impairment of the eyesight. It is, therefore, of the highest importance that class-rooms should be lighted scientifically. Bad lighting—both artificial and natural—has, without doubt, been responsible for the damage of good vision in recent generations. If unwell, a child may easily damage the eyes by persistent over-use. But assuming that a child is healthy, well-fed and clothed, the following rules are useful:—(1) One-sixth of the floor area in *actual clear glass* is necessary for rooms facing south. (2) One-fifth of the floor area in *actual clear glass* is necessary for rooms facing east and west. (3) One-fourth of the floor area in *actual clear glass* is necessary for rooms facing north. Specially note that *window-space* is not *glass*. (4) Any room 25 ft., or more, wide requires subsidiary light. (5) Left-hand light is important. If this be impossible, then right-hand is the next best (top-light being vetoed). (6) No windows for lighting purposes should be in front of either teacher or scholars; but a subsidiary light in the corner behind the scholars is sometimes imperative. (7) Class-rooms must be 10 ft. high; 12 ft. is usually sufficient up to thirty-six children, but for forty or more a greater height is necessary (according to the present Rules). (8) The higher the point from which the light comes the better. Hence, 12 in. or less should be allowed between the top of the window and the ceiling. (9) 3 ft. 6 in. to 4 ft. is the proper height of the glass line from the floor. (10) To increase the light the ceilings should be kept white, the walls pale grey, grey-green, or pale buff, and the ordinary woodwork white enamel. (11) Heavy piers between the windows, also large transoms and multitudinous little panes are all to be avoided. (12) Artificial lighting should be arranged so that the light falls as nearly as possible on the desks as with natural lighting. Thirty candle-power per square of 100 ft. super of floor area (often allowed) is insufficient; fifty is necessary, but a shaded sixty is best. At a height of, say, about 8 ft. from floor, and with rooms about 12 ft. high. (13) Rooms which are overlighted prove a great strain on the eyes, they are difficult to heat in the winter, and are over-hot in the summer. (14) The object of all natural lighting should be to attain 1/1000 of the outside illumination, or an average of one candle-foot (*i.e.*, a good reading light), and the artificial lighting should approximate as nearly as possible to this standard. (15) Unprotected lights should not be used. (16) Governors are necessary, either on the fitment or on the meter, if the pressure is irregular (*i.e.*, gas). (17) All lights should be examined periodically and kept clean.

The Vexed Question of Halls.

We now come to the vexed question of halls. First, it may be premised that a hall is not an absolute necessity, but some room large enough to accommodate the

whole school at once is desirable for the purpose of daily assembly. This is the great difference between the planning in America and that of our own. In this country daily assembly is the rule. In Germany and America it is not. In both these countries the hall is often found on the top floor, and is frequently used as a gymnasium. In England we regard the hall as a keynote of the plan, with the class-rooms opening therefrom as much as possible.

The size of the hall will depend on the numbers of the school, and the area is $3\frac{1}{2}$ to 4 sq. ft. per child. In secondary schools, principally because its use is intended for examinations and entertainments, 6 to 8 sq. ft. is the rule.

In elementary schools the axis of the top-lighted hall is best placed north and south. This will allow the class-rooms, placed on two or three sides of it, to get the sun during some part of the day, with their windows facing south, south-east, and south-west. Most schools now have central halls, and as to whether the school is situated in a country place, where land is cheap and there is plenty of space, or in a town where land is dear, will depend its situation. In some of the newer schools, as those in Staffordshire and Derbyshire—all on the ground floor—plans have been utilised which give the class-rooms, windows on each side, and a central hall connected with them by corridors, and not opening from the central hall direct. With a view to physical exercises this is excellent. In bad weather each class may be separately exercised in the hall without disturbing any other.

One of the best regulations of the Board of Education is that (1909) whereby every school has to do physical drill work as part of the ordinary school curriculum. Keen observers knew that this regulation would of necessity be enforced, as the race in the towns, in spite of a steady influx from healthier bred country folk, is deteriorating, and they welcome it accordingly.

It will probably now be found feasible to deal with the south windows to class-rooms as French casements, and so practically to make the schools "open-air" in suitable weather.

Cloak-rooms.

Cloak-rooms are generally too small, badly lighted, ill-heated, and ill-ventilated. In one-storey buildings I am in favour of a top-light, with inlets of warmed fresh air and proper outlets; but where there is more than one storey it is usual to light them at the ends.

All lavatory basins are best placed in separate rooms when funds allow. No floors inside a building should be of asphalt, as has been recommended on high authority, because the condensation of moisture in the air renders its surface damp, dark, insanitary, and unpleasant. Asbolith, Euboeolith, or Doloment are more satisfactory. Floors of these materials may be cleaned with either water (not hot) or Ronuk, and the junctions of walls and floors rounded and carried up the walls an inch or two to meet the tiles, glazed brick, or granolithic facings.

The cloak-rooms should never be passage-ways to the school-rooms or class-rooms, but should be entered from a corridor. Careful planning is necessary to obviate crowding and confusion at dismissal, therefore separate means of entry and exit should be arranged, so that a child may get his garment and go on and out, not retracing his steps, as an ordinary part of the school drill.

The pegs and supports are best of metal, painted with metallic, non-rustable paint, or electro-plated, but these latter are very expensive.

The *minimum* width of the gangways in cloak-rooms is given as 4 ft., but I think 5 ft. will be found much better, especially for girls.

The *minimum* space per child is 12 ins. This will be sufficient for boys, but more is desirable for girls. The centre divisions should be wired to prevent clothes back to back from touching each other. It is not necessary to have doors to the cloak-rooms, except in unusual circumstances, *e.g.*, where things get stolen or where the cloak-room is not on a level with the school, and therefore not under observation. But great care must be taken that the smells from drying clothes do not enter the school buildings proper.

Heating and Ventilation.

Low-pressure hot water is usually best for schools, but where a very large building has to be managed from one central boiler, low-pressure steam is essential.

In any high or medium pressure system it is best not to expose the pipes, as, in the case of overheating at any time, the particles of dust on the pipes get burnt, wafted about the rooms, and may cause irritation of the children's throats.

A very good rule for heating is to allow 1 sq. ft. of heating surface to each 100 cubic ft. of air space, and add to this 1 sq. ft. of heating surface to each 6 sq. ft. of glass area. Generally this will be found to give 60° F. when the external temperature is 30° F. This applies to rooms about 15 to 16 ft. high.

The boiler is the important matter in a heating system. I need hardly say that all material should be British; it is better made, lasts longer, and is cheapest in the long run. Buildings as large as 225,000 cubic ft. may be heated from one furnace by low pressure.

The best and strongest shape of a boiler is circular with domical ends. Economy is attained by an ample flue surface or height of furnace above the fuel, and by casing the boiler, etc. in asbestic material, and a large furnace gives the greatest power. It should especially be noted that the fire-bars should be thin and deep for efficiency and economy; $\frac{1}{2}$ in. wide by 3 in. deep, with $\frac{1}{2}$ in. space between each will be found to make clinker least, and another aid to this end is a trough of water about 4 to 5 in. deep.

The furnace-doors must have a sliding shutter to admit air over the fuel for deep fires. A perforated baffle plate is also necessary to keep this door cool. Ineffective circulations are often traceable to a bad boiler. The radiators are best of the hospital type, *i.e.*, without any ornament, perfectly smooth, rounded, and with the loops wide apart for cleaning purposes.

Of course, there must be no dips in the rising main, or air-locks will arise and impede the circulation. It is also good economy to keep the furnace going all the week till the Saturday morning, when the school is shut and it can be cleaned thoroughly.

Ventilation is a much more intricate matter, and the various systems each have their advocates.

In the author's opinion, the nearest approach to natural ventilation which can be devised is best, because it is a mistake to train children to think that fresh air is disadvantageous, and that windows must be kept shut, and it is only rarely

in very bad atmospheres that it is imperative to filter the air and force it through the building by a system known as "the plenum." Moreover, in this system all parts must be cleanable, and its cost is prohibitive, as a rule, with the exception that the fuel bill is usually moderate. But a skilled man in attendance is necessary.

The usual school window, as near the ceiling as possible, is an admirable way of admitting air; the top falls in, and the two sashes admit air at three other points. It is as well to prevent draught by placing an upwards deflector on the sill; and ventilating radiators are also employed, as well as Tobin tubes in the corners. The outlets, however, may be well aided by electric fans or gas jets at the highest points. Dr. Kerr, in a report to the Education Committee of the London County Council in 1904, recommends a combination of the plenum system and exhaust with an air supply of 1,500 cubic ft. per child per hour, or about eleven changes per hour. The author regarded this as only necessary in certain places, and considered that if the natural means of ventilation are scientifically utilised (1) by the architect in the first instance, and (2) by the teacher in the second, that it is rarely necessary to use the plenum system in schools. It should be possible, however, to aid the natural system, when necessary, by electric fans, etc. The following points are of importance:—

The *minimum* per head is 2½ sq. in. for inlets, and this necessitates induced draught by means of suction at the outlets, an electric fan being very useful at the start.

Systems which dry the air are bad, as also are those which create draughts along the floor: 1,500 cubic feet of air per head per hour is the lowest necessary provision. To avoid draught 6 ft. per second is the most rapid passage of air permissible. Fireplaces have been condemned in some quarters as dusty and dirty, but they are most useful as ventilators, as they aid the ventilation when most needed. It is necessary to maintain the temperature of the rooms at from 56° to 60° F. when it is freezing outside, and this must be by warmed, comparatively pure air—say 6 parts in 10,000 of carbonic acid gas.

The temperature should never be allowed to fall below 55° nor to rise above 63° F. Thermometers should be kept in every room for the purpose of recording regularly on a chart the temperature at, say, 8.30 a.m. by the caretaker, 12 noon and 4 p.m. by the teacher of each classroom.

Sanitation.

Numbers of closets, etc., per child are given in the proportionate scale in the Building Rules. A good drainage system must be simple, in straight lines, and self-cleaning as far as possible. But it must be remembered that no drains are automatic—they all require periodic cleaning.

I do not think it wise to combine both sewer-water and rain-water in one system, because of the danger which arises when the water in the traps of rain-water gullies evaporates or freezes. These traps may then become ventilators for the drain, and even the sewer. But, *per contra*, when it is the duty of someone to see that gullies are properly trapped, in frosty or very hot weather particularly, the rain-water flushes the sewer.

Baths, sinks, and lavatories should discharge under gratings over properly trapped gullies.

The ventilation of the drain should be in the disconnecting chamber at some point near to the main sewer. A trap with a good seal should prevent sewer-air from entering the drain. The fresh air inlet should have a protected mica-flap, to prevent it becoming anything but an inlet, and a long outlet should be provided at the highest point of the system. If more than one outlet is arranged, then the size of the inlet should be increased proportionately.

A new mica-flap inlet has just been introduced which prevents boys, etc., from meddling with it, which is a great temptation, as it is generally placed at a convenient height to receive orange-peel, etc.

Drain pipes should be as small as is consistent with self-cleansing gradients. A handy rule is that the fall for a 4-in. drain is 1 in 40; a 6-in. drain 1 in 60; a 9-in. drain 1 in 90. These velocities give 2½ ft. to 5 ft. per second, the supply of water being ample. The sanitary arrangements in elementary schools are kept in the playground; in secondary schools they are attached to the schools, but disconnected.

Conclusion.

In this short paper I have been obliged to exclude many interesting topics, such as open-air schools, swimming baths, etc. How far a child, for instance, should be clothed, fed, and washed by the State is a question of economics. It is obviously impossible to educate a child properly who is unfed, thoroughly chilled by insufficient food or clothing, or who is very dirty. I am of opinion that the German system should be followed with regard to this, in making washing, spray bathing, and certainly swimming, a regular drill; but the author was of opinion that no child ought to come to school either so dirty as to necessitate his being thoroughly washed or requiring feeding. It is outside this paper to deal with such matters, but if a child should arrive at the school in this state it does not seem to me the business of an educational authority to deal with it, beyond excluding him and reporting the fact to the sanitary authority.

Broadly, in this connection, the author would refer those interested in Eugenics to the papers issued under the auspices of the Francis Galton Laboratory for National Eugenics, which have been prepared with extreme care and accuracy. Every school should now have a properly equipped doctor's room, and, after the lapse of a decade, most valuable data should be available from the medical reports.

The ideal school should be an education in itself, in orderly planning, in proportion, which arises from orderly planning—eurythmy, as Vitruvius calls it—and in general ideals. To build schools like glaciars in angularity and eccentricity, or resembling barracks in their barrenness, is to deprive the children of what may rightly be called their birthright of beauty.

LETCHWORTH GARDEN CITY.

In the annual report of the First Garden City, Limited, it is stated that during the past year the net loss on the revenue account was reduced from £3,692 to £1,676—a reduction of £2,016, or more than twice the previous saving. Immediate further capital is required, however, for development owing to the advent of four new industries, and it is estimated that at least

£20,000 will be required for necessary extensions in order to cope with a rapidly increasing population. The number of new houses, shops, and public buildings built or building at November 15th, 1910, was 1,292, and 42 factories and workshops, compared with 1,171 houses, shops, and public buildings and 35 factories and workshops on the same date in the previous year. Copper smithing, corset making, commercial and pleasure motor-car building, manufactured joinery, are all new and important additions to the industries of the town. At the recent annual meeting the chairman (Mr. J. E. Champney) further pointed out that an ordinary building estate sells the freehold as fast as its expenditure on making roads, drains, etc., creates building land; these successive sales provide the money for further development. "We, on the contrary," he remarked, "are trying to keep the freehold in our own hands, and are, in consequence, driven to make increased demands for new capital, otherwise the development of our project must and will stop." The Letchworth Parish Council has taken over the provision of an efficient fire brigade, and "with a population of 7,000," said Mr. Champney, "we may fairly indulge in visions of the future when the chairman of the Urban District Council of Letchworth becomes the first mayor of the borough."

CEMENT CONCRETE VATS AND TANKS.

Impervious, odourless, tasteless, and sanitary vats and tanks for buttermilk, wine, oil, pickles, sauerkraut, etc., can be constructed of reinforced concrete, the reinforcing to be designed by a competent engineer, provided the interior surfaces are treated as follows:—

After the forms are removed, grind off with a carborundum stone any projections due to the concrete seeping through the joints between the boards. Keep the surface damp for two weeks from the placing of the concrete. Wash the surface thoroughly and allow to dry. Mix up a solution of 1 part water glass (sodium silicate) 40° Baume, with 4 to 6 parts water, total 5 to 7 parts, according to the density of the concrete treated. The denser the surface the weaker should be the solution.

Apply the water glass solution with a brush. After four hours and within 24 hours, wash off the surface with clear water. Again allow the surface to dry. When dry apply another coat of the water glass solution. After four hours and within 24 hours, again wash off the surface with clear water and allow to dry. Repeat this process for three or four coats, which should be sufficient to close up all the pores.

The water glass (sodium silicate) which has penetrated the pores, has come in contact with the alkalies in the cement and concrete and formed into an insoluble hard material, causing the surface to become very hard to a depth of ½ to 1 inch, according to the density of the concrete. The excess sodium silicate which has remained on the surface not having come in contact with the alkalies is soluble, therefore easily washed off with water. The reason for washing off the surface between each coat and allowing the surface to dry, is to obtain a more thorough penetration of the sodium silicate.

It is obvious that concrete surfaces so treated, if hard, impervious, and insoluble, have been made impervious, tasteless, odourless and sanitary.

ARCHITECTURE CONSIDERED AS PLAN AND SECTION.

BY H. H. STATHAM, F.R.I.B.A.

The following is the substance of a paper read by Mr. H. H. Statham, F.R.I.B.A., on January 9, 1911, before the Architectural Association.

MANY years ago there appeared in the "Westminster Review," in the days when that periodical was an intellectual power in the land, a remarkable article on "Winckelmann and Greek Art," which to some extent coloured my feelings about art for the rest of my life. The author, as I learned long afterwards, was Walter Pater, and the article was probably his earliest essay on æsthetic subjects. In the course of it, speaking of the distinction between architecture and the arts of sculpture and painting, he said:—

An Abstract Conception of Architecture.

"The arts may thus be ranged in a series, which corresponds to a series of developments in the human mind itself. Architecture, which begins in a practical need, can only express by vague hint or symbol the spirit or mind of the artist. He closes his sadness over him, or wanders in the perplexed intricacies of things, or projects his purpose from him clean-cut and sincere, or bares himself to the sunlight. But these spiritualities, felt rather than seen, can but lurk about architectural form as volatile effects; to be gathered from it by reflection; their expression is not really sensuous at all. Architecture is the mode in which the artistic effort centres."

Here was a totally abstract conception of architecture, as the walling up and covering in of a space, and as capable of poetic expression from that point of view alone, independent of any considerations of style or detail. That sentence, "He closes his sadness over him, or wanders in the perplexed intricacies of things," has haunted me ever since. If you come down to the primary elements of architecture, does it not consist in laying out a plan in an effective manner, and in covering in that plan in a manner at once effective and structurally sound? I am asking you to consider architecture this evening from that point of view. There is a moral connected with it; but the moral, according to traditional usage, comes at the end.

Character in Plans.

No architect worth the name ever lays out a plan without having present in his mind at the same time the manner in which he means to roof it in; and the mere aspect of a plan on paper at once sets the mind thinking as to what the section of the building would be. But even apart from that consideration, a plan, merely a plan, has its own expression and its own suggestiveness. Does not the typical Egyptian plan at once suggest an architecture of solemnity and mystery, in which the whole plan is an anticlimax, and the mystery narrows and closes round us the further we penetrate into the recesses of the buildings. How striking it is, too, to compare the typical plans of the Egyptian, the Greek, and the Gothic temple! Is not the prevailing character of the religions to which they are dedicated expressed in the three plans? The Egyptian the plan of mystery, closing in the more as you enter it, and showing nothing externally but the entrance pylons and a blank wall; the Greek the plan of rationalism—a columnar

display on the exterior, and a wide interior plan neither enlarging nor diminishing as you enter it; the Gothic the plan of aspiration, widening and enlarging to its inner and more sacred extremity. Even in comparing the archaic Greek temple with the Parthenon, we see the progress from the long narrow *cella* of Selinus to the broader one of the Parthenon, significant of the development in the direction of a more cheerful and rational religious rite.

The Plan and the Roof.

The three types of plan referred to just now tell their own tale as to roofing. The Egyptian and Greek plans are manifestly the plans for flat roofing; the small inner apartments in the Egyptian plan might be vaulted, but there can be no sense in the forest of columns distributed over the floor of the larger halls except to uphold a flat roof; and the Greek *cella* shows no abutment for an arched roof. The Gothic plan, on the other hand, proclaims the preparation for the arched roof; we see the change in the walling, from Romanesque to Gothic, as the vault is adopted and the masses of wall pivot about and take their stand at right angles to the thrust of the roof.

As an example of the crude fashioning of a plan without any order or any dominant idea, and also of the effect of roofing upon plan, we may take Khorsabad. This is a mere warren of straggling apartments grouped on no system; it is true that this was a palace for habitation, not a temple; but why are the rooms all long and narrow? Because they were roofed by a crude system of vaulting, erected without centering, and which could not be carried out over a wide space. This is essentially an uncivilised plan; what a difference when we turn to the plan of Spalato, with its wide spacing and symmetrical arrangement! In this latter point, however, it is surpassed by the plan of the Escorial. It would not be a bad subject for the Tite Prize, to give the competitors the plan of the Escorial and the mission to treat it in the best Italian manner they could. Another example of a great plan is Inigo Jones's Whitehall Palace, one of the finest schemes for a great palace that have ever been conceived, like the Escorial, impressive even on paper; notice especially the splendid idea of the columned circular gallery as the State approach to the private apartments of the Sovereign; an idea unique, as far as I know, in architecture. If anyone objects (as many certainly would have objected thirty years ago) that the executed portion of the building is too cold and formal in style, I reply that that does not affect the grandeur of conception of the plan. But, in fact, Inigo Jones's severe and scholarly style of classic architecture was exceedingly suitable to the dignity of a great royal palace, and had his design been carried out, London would have possessed the greatest Renaissance building in the world.

A Spoilt Opportunity.

One has only to turn to the plan of Versailles to see how an architect who was not a great genius could spoil an even finer

opportunity. For a great royal château Versailles has an absolutely ideal position, with the great courtyard rising with a gentle slope up to the entrance front, and the other façade overlooking from a wide terrace the finest park in the world. But there is nothing great about Versailles except its situation. The detail is dull and mechanical; but even were it better the treatment *en masse* would have spoiled it. This largest palace in the world is entered in a corner, and does not contain a single staircase of spacious and monumental effect, and half the effect of the park façade is lost by the blunder of bringing out the centre block in an immense projection, so that from no point of view can one get the effect of the whole length of the façade. A very long façade may be accentuated in the centre by a slight projection, but to thrust a great mass of building out from the centre is fatal. Any projections on such a scale should be at the wings, not at the centre. Versailles, in fact, is an immense plan with no leading or dominant idea except that of mere size.

The typical plan of a mosque, as seen in the plan of Ibn Touloun, is an example of another kind, of the equal distribution of points of support with no leading feature. This was for practical reasons. A mosque, it must be remembered, is not a temple in honour of the Deity; in the Mahomedan creed, "the most high dwelleth not in temples made with hands"; it is simply a shelter and a place of seclusion for the worshippers, who especially congregated at the inner end of the enclosure, to pray in the direction of Mecca; consequently this portion was to be completely covered in, but for practical, not for architectural reasons; so that the equal distribution of points of support supplied all that was wanted. At Cordova the idea was carried further, and the whole area covered in, with great richness of decorative treatment; but the idea was still the same; it is a shelter, not an architectural temple.

Mediæval Planning.

In the Christian church there was from the first a leading idea in the special importance and sanctity of the east end (using the word in its ritual sense, for many of the Italian churches were not orientated). But the plan and section of the early Basilica church suggested no special architectural motive beyond that of the perspective effect of a colonnade or arcade leading up to the apse. If we take the plan of the old St. Peter's Basilica, there is nothing in it to suggest anything in the architectural treatment beyond the very plain and simple section which is familiar to us in illustrations. Here the transept is only a practical provision for subordinate apartments, and has not yet assumed any architectural importance. With the development of the choir and transepts the crossing became architecturally the dominant point of the design. As Fergusson quite truly remarked, the weak feature in the mediæval plan was that this central space was so small. Its accentuation in section clearly pointed to the employment of a high and towerlike structure, since the width was not sufficient for effect with anything in the shape of a domical covering. The architect of St. Sernin at Toulouse, in the Romanesque period, hit upon the real way to treat it with the class of detail in use at that time; somewhat the same treatment was employed at Chiara-valle; and later the same thing was done, in equally fine style, but with different detail, at Salisbury. The introduction of the octagon crossing plan at Ely was a

The south range of Clare College was commenced in 1640 and finished in 1642. The work, therefore, belongs to the time of Charles I., and is what is called Jacobean. Certain parts of it, however, were altered about 1760, notably the windows, which originally had pointed heads. As a window suitable for collegiate work especially, this is a very useful example, the mouldings being particularly good.

GROUND-FLOOR WINDOW ON SOUTH SIDE OF CLARE COLLEGE, CAMBRIDGE.

manifest improvement in this portion of the plan, and the design of the exterior lantern (though unfortunately not in monumental stonework) just expresses it; in this case a central spire would be out of place and contrary to both plan and structure.

English and French Cathedral Plans.

Though the finest of the French cathedral plans are superior to the long narrow English plan, in their effect of climax, as at Rheims, produced by the widening of the plan towards the east end, there is perhaps a greater variety of interest and suggestiveness in the English cathedral plans. Sometimes, again, we come on a plan which represents a distinct and uncommon idea, quite apart from the general type; as, for instance, at Charroux, with its remarkable choir on a circular plan. A still finer instance is the grand plan of St. Gereon at Cologne, with its elliptical nave and the long choir opening out of it. Hardly any detail could prevent that being a fine interior. Tournai, with its apsidal terminations to the transepts, is another striking instance of special interest and character in the plan.

Domed Churches.

When we come to consider domed churches, we recognise that, in connexion with plan, they fall into two classes—those in which the dome is the main covering of the whole or greater part of the centre of the area, and those in which it is the accentuation of a special open space which forms only a portion of the plan. This sheet of plans of domed churches of the former class affords a remarkable illustration of the manner in which plan forms an element of design. Every one of those plans represents in itself a distinct architectural idea, each suggestive of a different section, and each capable of very varied treatment in detail. San Vitale is a celebrated church of this class, which has, to my thinking, the drawback that no exterior dignity is obtained from the central dome; it is practically an internal architecture only, a defect which it shares with the greater Byzantine church at Constantinople. With all that provision for butressing on the plan of San Vitale, something more might surely have been done with it than merely to build a thin dome as an interior shell, with a low-pitched roof over it. A magnificent example of the central dome plan is the church of the Madonna di Vico in Piedmont, where, as in the case of St. Peter's, the doming over of the central area seems to have frightened two or three architects before it was finally accomplished. I should certainly like to know how Francesco Gallo managed to plant that large lantern on the top of this rather flat dome without coming to grief. It has stood, however, for three centuries.

Michelangelo and St. Peter's.

The plan of St. Peter's as intended by Michelangelo is of some interest, for it shows how much better a composition would have resulted if the building had been let alone instead of being lengthened out by Carlo Maderno. We should then have seen it as a pyramidal composition of which the dome was the main feature, instead of the dome being relegated to a back position in the composition, as seen on approaching the entrance façade. One weakness in Michelangelo's plan, however, is that he has not made as much as he might have done of the apses to the transepts and choir; they are rather timid in line and proportion: we realise this at once on comparing it with Sangallo's plan,

which in this respect is much bolder and finer. Why Michelangelo, who was perfectly acquainted with Sangallo's design, should have chosen this less bold and effective treatment, is perhaps explained by the fact that he was determined, whatever he did, to differ from Sangallo.

A single dome must, of course, be the covering and the accentuation of the most important portion of the plan. Where more than one dome is introduced, it may be laid down that a dome is essentially a form to be employed in a square or transeptal form of plan, and not in a plan in long perspective. At St. Mark's and at St. Front, Périgueux, which probably drew its inspiration from St. Mark's, we see a principal dome at the centre, with subordinate domes grouped around it, each one the roofing of a square compartment; a perfectly suitable application of the feature. At such a church as Angoulême, a long church with a series of domes, the dome is a less suitable feature; the succession of domes interrupts and breaks up the perspective rather than assists it. The vault is the suitable form of roof for the long church, the dome for that which is developed from a square plan. Wren's first design for St. Paul's was, both internally and externally, the single-dome design, a great central space covered by a great dome. Taken as a whole, it is a far finer conception than the existing building, though in detail the model may not be in all respects equal to the latter; at all events, it shows nothing so charming as the present western towers. Externally, St. Paul's is still the single-dome design, but internally it is roofed by a series of smaller domes. I think it is impossible to turn from the original plan to that of the existing church without feeling that we are in presence of a plan very much inferior to the first one; a feeling in which I think Wren would have entirely concurred.

The Houses of Parliament.

The importance of the element of plan is nowhere better exemplified than in the Houses of Parliament. There was a foolish controversy a good while ago as to whether Pugin or Barry ought to have the credit of the building, on the supposition that the Gothic detail was Pugin's. I doubt if the exterior detail was Pugin's, though he no doubt designed a great deal of the interior work. But the controversy was entirely beside the mark: the detail is the weakest part of the building. Its greatness consists in the grand simplicity of the plan, the centre octagon with the main corridors leading right and left to the two chambers, and in the great exterior composition of the two contrasted towers and the central lantern marking the position of the octagon; the detail is a secondary matter altogether. That plan has been copied in buildings of a similar class all over the world. The Budapest Parliament is almost a direct copy of it, with one additional point which our building wants—that the position of the two chambers is shown in the exterior design. Another example of a plan formed on similar lines is Mr. Ernest Flagg's fine competition design for the State House of Minnesota.

St. George's Hall, Liverpool.

St. George's Hall, Liverpool, is a fine example of a great comprehensive plan, the architect's intention in which was not altogether realised in execution. Elmes's idea was that the great central hall was to be a *salle des pas perdus* for the two law courts, which were to be at opposite ends

of the hall, divided off only by curtains, and that there was to be a vast vista, at the opposite ends of which were to be seen the two judges sitting in state. Whether that would have conduced to the convenience or comfort of the courts was a question on which I am afraid Elmes did not trouble himself much: he thought only of great architectural effect, and he was perfectly mad when he learned that his vista was to be closed at one end by a great organ-case. But it certainly was a grand architectural conception, whether convenient or not.

The Great Court of the Louvre.

Among plans for public buildings Bernini's plan for the great court of the Louvre is of some interest, from the effective manner in which he proposed to treat the re-entering angles of the quadrangle, by bringing them out and accentuating them. The inner angles of a great quadrangle are apt to be weak points in the plan, and Bernini's way of treating them is worth attention. To come to an existing example of well-thought-out and practical planning there are few better things to be seen than the planning of the Birmingham Law Courts, by Sir Aston Webb and Mr. Ingress Bell. I believe the actual plan was Mr. Bell's personal work. It answered, I believe, all the requirements of the promoters, and you see how perfectly simple and straightforward and symmetrical it looks; but that kind of simplicity is not attained without much thought and trouble. There should be a centralisation, a backbone as one may say, in the planning of a public building.

Some Old Renaissance Mansions.

Some of the old Renaissance mansions show this peculiarity of a close approach to symmetrical planning, but just missing it; Longleat is an example. Blenheim shows the element of stateliness in planning carried, one might say, to an extreme. The next plan shown consisted, I believe, of wings added at each end of an old mansion, but the recessed portion between the centre and the wings is, on the right hand, the end of a large picture gallery; on the left hand it conceals some small rooms connected with the service. Some people may think that does not matter so long as exterior symmetry is preserved, but it seems to me rather a false method of planning. There is a plan by Mr. E. J. May, additions to Jardine Hall, which I have always admired, and which shows how a very stately effect may be given to an interior of a mansion on not a very large scale. By placing the dining-room and drawing-room at opposite ends of the house, connected by a wide corridor over 100 ft. in length, he has provided for a kind of state procession from the drawing-room to the dining-room, giving the guests the impression of being in a larger mansion than they imagined.

A New Idea.

As a modern example of a plan which is in itself a new architectural idea, I would cite the buildings at Paris called the "Petit Palais" (though it is really a very large building), by M. Girault. This is entirely an original conception in plan; the front block forming a great straight gallery with a dome over the centre, the remaining portion of the plan forming two ranges of galleries are within another, the inner line of the building forming a semi-circular loggia round an interior garden court. This is a piece of real invention in architecture, such as we do not often meet with.

Referring again to the idea that plan is in itself an expression of architectural design, I would suggest that even a block plan may be so regarded. When, some fourteen years ago, the Institute of Architects did me the honour to ask me to read a paper on the question of the sites for the Government Offices, I put my own idea on the subject into a block plan, which received such flattering notice from speakers at the meeting that I may perhaps be excused for feeling a little proud of it. My idea was that the Admiralty (a) was to be completed, as three sides of a quadrangle, the First Lord's house (c) forming a central object on the fourth side of the quadrangle, with a screen colonnade on each side of it. The War Office (b) was to face the Admiralty with a somewhat similar quadrangle, and the Commander-in-Chief's residence, or his Staff Offices, responding to the First Lord's house. An important sculptural war monument would occupy the centre of the roadway between them. All the west side of the street north of the Admiralty was to be set back so as to render it the same width all the way up, and bring the axis of the street to join the centre axis of Trafalgar Square at a point marked by the Charles I. monument, which would only require to be shifted a few yards to come into the scheme. That was what I thought might have been done if the Government could have been persuaded to spend money to do the thing on a grand scale, worthy of the nation. An important point in my mind was that a great national building of this kind should make a *place* for itself, and not merely follow the street lines. The French Government would have realised that; our Government only considers economy of building land, and so the War Office has actually been built in an irregular shape following the street lines, as if it were only a monster hotel which was to make the greatest commercial return out of every yard of ground.

[*The Essential Element in Architecture.*

And now for the moral. We have stretching for a century behind us the battle of the styles, less active and exacting now than it used to be, but still not by any means extinct. Most of us are still troubled with searchings of heart as to which style is the right one for permanent adoption; one of the considerations in working out a design for a new building still is—consciously or unconsciously—"What style shall it be in?" I am proposing to deliver you from all this, once for all, by recommending you to adopt a view of architecture in which detail, in a sense, does not matter. Professor Lethaby some time ago proposed that we should solve the problem by hunting down, as he expressed it, all the accepted detail, and beginning again with no details or mouldings, and see what we arrived at. I think that is rather too stern a gospel for general acceptance, and moreover that we are much more likely to come on interesting and original detail by developing on traditional lines than by evolving detail out of our inner consciousness. What I want to suggest is not, of course, that good detail is of no consequence, but that, provided it is good of its kind, it really does not matter what kind you adopt, so long as the main conception of the building is a fine and effective one; and that the effect of most of the great existing buildings of the world depends on their general conception, and is to a great extent independent of the style of detail. Take, for instance, the plan and section of Palladio's church

of the Redentore. That is a church with a series of deep side chapels, and a dome covering the centre space between three semicircular tribunes. The side chapels are divided by decorative classic columns, but you know well enough that those are not essential but accidental; the essential conception is a series of deep bays at the side of the nave, and a domed centre flanked by semicircular spaces; the columns and the other classic details are not necessary to it; the same general conception might have been carried out with half a dozen different forms, and still have retained its essential character, and remained a fine architectural conception. Or take the Pantheon, one of the finest conceptions in architecture; what has the classic detail, essentially, to do with that? In this case the detail actually spoils the main result; the Order is too small for its position and seems crushed by the superstructure. The plan and section, in other words the same leading idea, might have been carried out with much finer effect with a detail entirely different from this. Or, to refer once more to the great building which is nearly within a stone's throw of us, I put it to you that if, by the wave of an enchanter's wand, you could in a moment transform all its Tudor detail into Renaissance, the Houses of Parliament, in all the qualities which make its real architectural greatness, would still remain what it was, and its claim on our admiration would be in no way affected. In short, the delivery from all this imaginary bondage of styles lies in the recognition of the fact that the essential element in architecture is the embodiment of an idea expressed in plan and section.

OUR PLATE.

The cartoon of a female figure representing "Silence," which we publish as a centre plate in this issue, is clever alike in its general arrangement and in the very skilful drawing of the drapery; and fully merits the silver medal which the artist, Miss Margaret L. Williams, gained in the Royal Academy students' competition last month. A review of the designs exhibited was published in our issue for December 21st.

FEDERATION NEWS.

Sunderland and District.

The annual general meeting of Sunderland and District Building Trades Association was held in the Board Room, 14, Norfolk Street, Sunderland, on December 8th, Mr. J. Morice Wright presiding.

The secretary submitted his thirteenth annual report, which dealt exhaustively with the work of the association during the year. The report was adopted, and the thanks of the association were accorded to the secretary.

The balance sheet, as audited, showed a good balance in hand, and was accepted. Arising out of the balance sheet, Mr. J. W. White drew attention to the fact that many of the members did not insure through the association's agency. He reminded those who insured outside the association's agency of the rule requiring them to forward to the association the equivalent of the commission so lost to the association, and asked that the rule should be complied with, as the commission earned assisted to keep down the annual subscription, and it was unfair that those who insured through the association's agency should have to pay the same rate of subscription as those who did not. He moved to that effect, and the motion was agreed to.

Mr. J. Morice Wright was re-elected president, and Mr. John Emmerson vice-president. Mr. Fred. W. Ranken was re-elected hon. treasurer, and Messrs R. J. Hudson and Joseph Carter were re-elected hon. auditors. The Executive Council was elected as follows:—Messrs. J. M. Wright, John Emmerson, R. J. Huntley, John W. White, W. B. Cooper, J. McMillan, G. Swan, A. Stafford, J. M. Gibbons, T. Scafton, James Taylor, R. J. Hudson, and J. Carter.

The representatives on the Board of the Northern Counties Federation were re-elected as follows:—Messrs. J. M. Wright, J. Emmerson, W. B. Cooper, J. McMillan, A. Stafford, and R. J. Huntley. The employers' representatives on the Conciliation Board were re-elected as follows:—Messrs. J. M. Wright, J. Emmerson, R. J. Huntley, F. W. Ranken, W. B. Cooper, A. Stafford, Geo. Swan, and J. M. Gibbons.

The Bricklayers' and Joiners' Trade Committee was re-elected as follows:—J. M. Wright, J. Emmerson, R. J. Huntley, F. W. Ranken, J. W. White, W. B. Cooper, and Geo. Swan. The Plasterers' Trade Committee was re-elected as follows:—Messrs. J. M. Wright, J. Emmerson, W. B. Cooper, J. W. White, and James Taylor.

Messrs. Clercy and Charlton were elected ordinary members of the Association.

Mr. J. Morice Wright, as chairman of the Dinner Committee, gave a report as to the arrangements made in connection with the association dinner.—W. H. HOPE, Solicitor, Secretary.

York.

The annual general meeting of the York Master Builders' and Contractors' Association was held at the Old George Hotel on December 22nd last, Alderman James Birch presiding over a large attendance.

The Executive's report on the year's work was read by the secretary. The treasurer brought forward his financial statement and balance sheet for the year, which was approved and considered satisfactory, although the year's revenue was diminished owing to a few of the subscriptions being unpaid at the date of the meeting.

The following were unanimously elected to office for 1911:—President, Mr. W. E. Biscumb; vice-president, Councillor Joseph Hardgrave; treasurer, Mr. Charles Dent; secretary, Mr. J. Hague; executive committee, Messrs. J. W. Bellerby, W. Bellerby, T. Beik, Councillor F. W. Birch, W. Birch, J. W. Biscumb, H. Colman, R. Dent, J. Fairweather, Alderman J. Birch, H. Harrison, W. Mansfield, G. Rawling, Councillor G. Sharp, G. Turner, W. Usher, L. Wray, and A. J. Warrillow; Yorkshire Federation representatives, Mr. W. E. Biscumb, Councillor J. Hardgrave, and Mr. C. Dent; National Federation representatives, the President, Vice-president, and Treasurer, with Mr. H. Colman as reserve; Standing Trade Committees: Masons—Messrs. Atkinson and Sons, Messrs. Biscumb and Sons, Parker and Sharp, T. Rawling, A. J. Warrillow, and W. Hall; bricklayers—Messrs. Biscumb and Sons, Dent and Son, Colman and Son, Walker and Son, Wray and Sons, Turner and Sons, Parker and Sharp, I. Belt, W. Birch, John Borwell, W. Mansfield, and T. Rawling; joiners—Messrs. Biscumb and Sons, Dent and Son, Harrison and Co., Hick and Hobson, Colman and Sons, Shepherd and Son, Fairweather and Son, W. Bellerby, G. H. Belt, W. Mansfield, and W. Usher; slaters—Councillor J. Hardgrave, Dodgson and Son, and R. Sherry; plasterers—Messrs. Young and Son, R. and S. Cram, T. Morris, S. Pickering, G. Rawling, and T. Myers; plumbers—Alderman J. Birch, Councillors F. W. Birch and H. Hopkins, Messrs. Braithwaite and Co., Ltd., Padgett and Son, T. Atherley, T. G. Hodgson, J. H. Shouksmith, and R. Calvert; painters—Messrs. Bellerby and Sons, Dodgson and Sons, T. M. Oxtoby, R. Pearson, T. Welburn, and J. G. Pearson; electricians—Messrs. J. Naylor and Sons, and A. W. House; engineers—Messrs. Dove and Sons, G. Dearlove, J. Hardgrave, G. W. Kirk, and W. Thomlinson Walker.

Notice of motion to rescind rule as to increase of 4d. per hour on day's work for skilled workmen was considered. The secretary read the minutes of June 28th and October 5th, after which Councillor W. H. Birch moved that the rule be rescinded. In the course of his remarks he stated it was not the time to make any increase. There was also no guarantee that the charge would be enforced, and any evasion would only cause soreness amongst the loyal members. The suggestion to charge on day's work only would be merely a pretence. The charge to be honest should be placed on contracts not day's work, as practically the whole of the accidents to workmen arose on contracts. Councillor Hopkins seconded the motion, but said he was actuated by different motives from Councillor Birch. He agreed the time was inopportune, and for the reason that owing to intended Government legislation in the near future, particularly the unemployment insurance question, the builder was likely to be still further harassed and taxed in his business. It was advisable therefore to await developments, as it would most likely be the increase of 4d. per hour was insufficient. Mr. W. E. Biscumb supported for similar reasons, but called attention to the fact that the employer paid a premium for compensation purposes on the gross amount of wages paid, whether for day's work or contracts. There was therefore nothing unreasonable in charging the increase to day's work. Mr. C. Dent supported, stating he was entirely adverse to the charge. 4d. per hour was too much, and would be found (if worked out by anyone) to much more than cover the cost of premiums. Alderman J. Birch also supported, on the ground that the whole subject must necessarily be brought up at some future time, when it would probably be found that 4d. per hour was not sufficient. The motion to rescind was eventually carried unanimously.

Messrs. J. W. Knowles and Sons, 23, Stonegate, stained and leaded light workers, were elected members.

It was decided to hold the annual dinner in the New Year.—J. HAGUE, Solicitor, Secretary.

The Students' Designs at the Institute.

THE two most important of the Competitions for Students at the Institute of Architects, the Soane Medallion and the Tite Prize, have met with an excellent response this year, the Tite Prize especially; and the award of the prizes must have been a matter of considerable difficulty.

The subject for the Soane, "A Gateway and Gatehouse to a Capital City," approached by a bridge over a river with a waterway 120 feet wide, is a subject of more purely artistic character, and less dependent on practical planning, than is usual; there are requirements for a Guard Room and a Bridge-keeper's residence, but these are simple matters easily arranged, and the question of planning, as well as of elevation, comes to be mainly a matter of architectural effectiveness. This, perhaps, made it a popular and attractive subject.

"Civitas," to whom the medal has been awarded, shows a fine monumental bridge of one elliptical arch, and his gateway is a very imposing structure in a modern variety of Classic, effectively treated on the flanks as well as on the front. There is what might be called a kind of Franco-German air about it, as if the author had studied at the Ecole des Beaux-Arts, and subsequently had his taste a little vitiated by German detail; this may be purely imaginary, but that is the impression given. The bad point in it is the crowning feature on the top of the gateway, which is coarse in outline and detail, and does not harmonise with the rest. A serious mistake is the introduction of a colossal statue on the open space in front of the gateway, which would have the effect of dwarfing the scale of the whole concern; but this is not part of the architecture. The parterres round the *place* are too much cut up into little rectangular patches; they should have been treated in a broader manner; and the bronze sculpture groups on the outlying pavilions are far too violent in outline and action. The showing of the perspective view as if in snow, with the snow making white lines on some of the masonry joints, is a little bit of trickery, though it certainly adds to the effect of the drawing. There are, in short, in this design a good many details which are not in the best taste, but the fact remains that it is the boldest and most effective design submitted, and therefore rightly earns the prize. Mere correctness will not save our souls in architecture. There is hanging close to this design a very simple one, signed "Boreas," which is in excellent taste, and presents nothing for criticism, but then there is nothing of interest in it either; it is all too obvious. "Nothing venture, nothing have," is a sound motto in this kind of competition.

An "Honourable Mention" and ten guineas have been awarded to two other designs. "Mauertor" is very clever, but not quite what should be taken to be intended by the programme. The perspective view, a fine and effective drawing, shows a mediæval gate-tower with a great circular turret at each angle, upon which has been superinduced an erection in early French Renaissance style; the author has added on the margin of one of the drawings a short imagi-

nary history of how a Renaissance architect was employed to add something "in the new style" to the mediæval gateway. This sufficiently explains the intent of his scheme, which is very cleverly worked out, and is certainly one of the best things in the room; but it is rather too archæological; we take it that the object of the competition was to produce such a design as might be erected in the present day as a state entry to a city on the bank of a river. His bridge is rather poor. The other design referred to, signed "Sillab," is completely modern, and shows a great deal of architectural ability; in some respects it might be said to be the cleverest design of the set, or at all events the one containing most promise of architectural ability in the future; but it is too much cut up into bits, and wants dignity and predominance in the central feature, as a state entrance to a city; and the cutting up of the entrance roads into three narrow roadways at divergent angles is not a very happy manner of planning. The visible combination of sloping red-tiled roofs with a Renaissance type of architecture we have noticed to be a fashion with students now, and of course there is plenty of precedent for it in Italian work; but in these days of reinforced concrete it looks rather too archæological. Cleverness is the note of this design, but it is a little too clever, and like other too clever designs it fails in dignity and unity of effect.

We may briefly notice a few others of the thirteen designs, taking them in the order of hanging. "Ponta" shows a dignified plan, with quadrant colonnades leading up to the gateway; general effect dignified, but the details rather commonplace. "Journey's End" has a very good bridge, which is the best part of his design; there is a fine perspective view, and the gate-tower makes a rather impressive mass, but the large half-octagon turrets on the flanks have no connection with the central mass, and give the impression of having been built on as an afterthought. Some of the details of ornament are very much open to criticism. In "Anchor" the bridge and pylons are too obvious an imitation of the Alexandre III. bridge at Paris, and in the pylons nothing is gained by fluting the angle columns, which only weakens the erection by detaching them from the general mass of masonry. "Harlequin" is the best of the non-premiated designs, and is very dignified in general effect; the mistake in it is that the pavilions stopping the quadrants at the outer extremity have their design carried down to the water level (specified to be "36 feet below the road"), so that in perspective we get the idea of a quadrant stopped by erections at two different levels. But there is a great deal of merit in this design, and it is a question whether it did not merit an "Honourable Mention" as well as the two others. "Horatius" shows some power and originality of conception and detail; but the bridge, effective in itself, does not seem quite to belong to the rest of the architecture.

The nineteen designs sent in for the Tite Prize fill the whole of the large meeting-room, and we must confess that we should have been sorry to have had the task of deciding which was the best out of all these, many of them showing great ability. The Tite Prize was founded to promote the study of Italian (i.e., Renaissance) architecture, at a time when Gothic was coming in like a flood; now "the wheel has come full circle," and Renaissance is once more the favourite style, without requiring any special stimulus. The

subject for the Tite has generally been one which would illustrate the treatment of Renaissance detail in a somewhat simple structure—a triumphal arch, a garden loggia, etc. This year there seems to have been a desire to stimulate competitors to something more imaginative, by the following programme:—

"A Campo Santo. The site to be on a rocky island rising out of an inland lake, with access to it by boat only. The island is roughly elliptical in shape, the major axis being 1,000 feet and the minor axis 700 feet. It rises sheer from the water for some 30 feet, and then, with a gradual rise of another 150 feet, to the centre or apex of the island. A landing stage and accommodation for boats must be provided. The island is assumed to be covered with ilex trees, which may be cut down as required. The Campo Santo must comprise a chapel having a floor area of about 3,000 feet, with choir, organ, sacristies, etc., in addition. Cloisters of ample width are to be connected with the chapel, providing wall and floor space for monuments and inscriptions. Suitable accommodation to be provided for fifteen gardeners and a resident surveyor."

This is very suggestive, but a large and difficult scheme; the choice of it is justified, however, by the fact that it has attracted an unusually large number of competitors. There are some amusing things among the designs, as might be expected; but there are a good many very meritorious ones. The architecture is specified to be treated "according to the methods of Palladio, Vignola, Wren, or Chambers." We should have thought the name of Bramante might have been added; and in fact the prize design, signed "F. 13," has a good deal of the influence of Bramante in it. This is not one of the most striking sets of drawings at first sight, but after looking through them all we must agree with the award. The design shows a cleared space with crossed walks on it, rising up towards a large domed church, and flanked on each side by an erection of level arcaded terraces or cloisters in three stories, the ground falling away down them on each side. The whole effect would be fine and solemn; the style is the arcaded Italian style, very simply treated in detail. A second place has been given to "Catafalque," who shows a classic colonnaded terrace, with a temple in the centre, the whole making a level line on the upper part of the island, contrasting with the lines of the land and of the stair terraces, by which the temple level is reached. The details are very good, and we notice that the author has shown a modified capital for a pilaster in opposition to the Corinthian capital of the column, just as in Doric architecture the pilaster capital is different from the column capital; this may count to him as an invention, for we do not believe it has been done before.

Honourable mentions have been given to two others. "Ek Thanatou Nikos" has perhaps more of artistic genius about it than any other set—we say "artistic," rather than "architectural," because the laying out of the plan is not the best thing in it, and is wanting in architectural treatment and axiality, though the details are very good. The perspective view, evidently suggested by the work of the German painter Böcklin, is a very fine piece of effect, but it is effect only; it has nothing to do with the representation of Italian architecture, since the architecture is reduced to a mere mass of white forming an element in the pictorial effect. The architectural details are very carefully studied, and the view of the columned atrium to the church has a very solemn effect. The author is certainly a young man of genius, and might have taken a higher place in the competition, or even have won the prize, but for his grotesque fancy of making the plan of his island represent a skull, with rocks for the teeth, etc. That kind of thing is a bad joke, such as we should not be surprised to meet with in the architectural room at the Salon (where one may see any kind of preposterous fancy); but it is not a kind of thing to be encouraged. The other design specially mentioned is "Apex," who has treated the island as a precipitous cliff in the centre (rather in contradiction of the instructions); the architectural details are good. Among the others, "Black Horse" shows some

graceful ideas; "Fiat Justitia" shows an effective plan of a Greek cross church; "Campana" sends a very creditable set of drawings; "Spero Meliora" is a promising student's design; "Nil" shows a fine church plan; and "Catacomb" has ideas in the treatment of his church, as a cemetery church—a great deal of blind wall with pilasters, and small windows high up in the walls; but he has spoiled it by an ill-conceived perspective drawing.

The Grissell Medal has not been awarded, at which no one will be surprised who examines the drawings, which show no grasp of construction at all; one of them seems based on a belief that a sound timber construction depends not on the method of framing timbers, but on the number of pieces that can be introduced.

The Owen Jones prize goes to a very fine set of coloured drawings, including the ceiling of the Torrijos Palace at Madrid; stained glass from the Ste. Chapelle; and the decorations of a room in the Castle Angelo. The set of drawings for which the Pugin Scholarship has been awarded includes a great deal of good drawing from English church architecture, especially a large measured drawing of the tower of St. Mary's, Stamford, which takes us back to the old days when such drawings were the ambition of every serious architectural student, and when they had a practical value, since the object was to build modern churches like unto these. Now we are more and more giving up that, and the question arises, How much longer will the Pugin student-ship survive? It promotes, however, the study of a beautiful class of English buildings, which might otherwise be neglected. The "Measured Drawings" prize also goes for drawings of a church, Edington (a rather poor example of late Gothic) by "Ethandun"; there is an excellent set of St. Laurence Jewry, by "Nil Sine Labore"; and "Oxonian" contributes drawings of Palladio's Basilica.

The real interest of the students' competitions lies, however, in the Soane and Tite designs, which represent architectural invention; and those of this year are fully up to, if not rather beyond, the average standard.

The awards are as follows:—*Soane Medallion*, "Civitas," Mr. P. Mawson, London, W.; hon. mention and ten guineas, "Mauerthor" (Mr. C. Percival Walgate, Kensington, W.), and "Sllab" (Mr. G. Douglas Robinson, London, N.). *Tite Prize*, "F. 13" (Mr. George Herbert Foggett, Kensington); second place, "Catafalque" (Mr. Henry Boddington, junr., Stockport, near Manchester); hon. mention, "Ek Thanatou Nikos" (Mr. W. G. Newton, London, W.), and "Apex" (Mr. V. O. Rees, London, N.W.). *Owen Jones Prize*, Mr. A. W. Bellis. *Pugin Studentship*, Mr. B. F. Cowper. *Measured Drawings Medal*, Mr. T. F. W. Grant. *Ashpitel Prize*, J. B. F. Cooper, Manchester. *Arthur Cates Prize*, A. G. Henderson.

The Mall Improvement.

THE important operation of completing the opening of the Mall into Charing Cross seems to have been delayed by a dispute as to who shall pay for it. The Office of Works maintain that the responsibility of the Government ends with the erection of the building by Sir Aston Webb, which forms the state entry to the Mall, and that the connection of this with the street at Charing Cross is a municipal improvement which is outside of their province. The London County Council and the Westminster Borough Council, on the other hand, maintain that the improvement is desirable in order to open up the Government buildings, and to provide a fitting approach to the Queen Victoria Memorial, and is therefore to some extent a National work; and on this ground they offer each to contribute one-third of the cost of demolishing the houses, and rendering the opening of the required width, if the Office of Works will contribute one-third. This appears to us to be a perfectly reasonable proposal under the circumstances, though apparently the Government has not, so far, acceded to it, as the conference between the representatives of the three

authorities concerned is reported as having come to no decision. With the Coronation ceremony and procession imminent, the delay in the matter is singularly unfortunate. It is to be hoped an agreement will be come to in time to allow of the Coronation procession adopting what is in every respect the most suitable route.

An Architectural Scholarship for South Africa.

THE course which architecture, carried out by English architects, should take in our Colonies, having regard to differences of climate and mode of living, is a question of great interest. In India we commenced with the simple assumption that what we were accustomed to practise in England it would be natural and suitable to practise in a conquered tropical country, and accordingly we built Renaissance public buildings, and (at Calcutta) a Gothic revival cathedral; and this spirit in Anglo-Indian architecture was carried on for a long time. Mr. Chisholm, however, attempted with success to combine European planning with a style founded on Hindu architecture, and Mr. Ransome has since pursued somewhat the same path, in a rather different style, in buildings which seem to represent English architectural taste coloured by Oriental conditions.

In connection with this subject, it is gratifying to find that an able English architect, Mr. Herbert Baker, who has made an exceptional position for himself in South Africa, has instituted a biennial scholarship to assist South African architects in the study of Greek and Roman architecture from their existing monuments. At first sight this does not seem to have any special connection with South African requirements; but Mr. Baker's statement of his case is perfectly logical. It stands thus: It is desirable that architects intending to practise in South Africa should be encouraged in the study of the best models in architecture, for the formation of their taste (and illustrations which we have seen of modern South African architecture show that there is great need of this), but it is also desirable that this study should be founded on the architectural monuments of southern Europe, which were developed in a warm climate and under a bright sun, and not on northern styles which were developed under quite different climatic conditions. This is sound common sense. And it is not contemplated by any means that the object of this study should be to reproduce Greek or Roman architecture on South African soil. The object is to train the mind of the student by the study of great examples of monumental architecture. This is admirably put in Mr. Baker's own words:—

"The successful candidate will be required to spend eight or nine months at Rome as headquarters, acting under the direction of the British School at Rome. This period will include a visit to Athens, with the British School there as headquarters. He must apply himself to the study of architecture and its allied arts, and not to archæology. He should devote his studies to the principles upon which the noblest architecture of all periods is based rather than to the superficial details, which are often the mere accidents of style. For the rest of the year he must make London his headquarters. He will then be required to continue his work in museums and libraries, and to study the architecture of Northern as compared with that of Southern Europe. At the completion of his year he must exhibit, under the direction of the R.I.B.A., the result of his studies, and submit a thesis on the relation of style in architecture to conditions of climate and practical requirements. He will then be required, within a limit of time fixed by the trustees, to hold one or more similar exhibitions in South Africa."

These conditions, it will be seen, provide explicitly for the consideration of the relation of the architectural studies to their practical application as an influence on modern architecture. The holders of the exhibition are to study the ancient monuments not as archæology, but as architectural suggestion.

The scholarship is to be of the value of £250, tenable for one year. Trustees in South Africa have been appointed, and in Europe the scholarship will be administered by the

Royal Institute of British Architects, working in conjunction with the British Schools at Rome and Athens. The scholarship will be open to any British subject who has spent seven years in the study and practice of architecture, and who has spent at least two-thirds of his architectural career in South Africa. It will be convenient to quote here the statement of the requirements which will be made from candidates:—

"Each candidate will be required to submit a portfolio of designs, drawings, or work of craftsmanship allied to architecture, all of which must be the product of his own hand and brain. He must also make a design, and write a short essay on given subjects. There may also be a *viva voce* examination, and an inquiry as to the candidate's character and general attainments. The selection will be made by the trustees, acting on the expert advice of an architect appointed by the council of the Transvaal Association of Architects, an expert (not necessarily an architect) appointed by the trustees, and myself or my nominee."

Further information as to dates, subjects of examination, and other details, will be given on enquiry, addressed to Mr. Baker, at P.O. Box 4,959, Johannesburg.

Mr. Herbert Baker, who gained the Ashpitel Scholarship at the Institute of Architects in 1889, was well known in London as one of the cleverest of the younger members of the profession, before his departure for the Colony. He was elected an Associate Member of the Institute in 1890, and a Fellow in 1900. In establishing this Scholarship he has done a good work, which will probably have important results on the future of South African architecture.

Lump Sum Settlements of Workmen's Compensation Cases.

AT the Lambeth County Court recently an application was made under the Workmen's Compensation Act to sanction the payment of a lump sum of money as compensation to a workman under an agreement to pay in discharge of the employers' liability. His Honour Judge Emden said that he did not approve of the payment of these lump sums. He believed that the larger portion of the work under the Workmen's Compensation Act was being transacted under agreements of that character, and the object of the Act was being defeated. If the case before him was an improper case to bring, it was not a case for an agreement at all, and ought to be dismissed. If it was a proper case, an agreement was not the right way to dispose of it, and he did not think the workman would be properly protected unless the matter came before the Court. He had been watching these cases for some time, and his conclusion, based upon investigation, was that the whole beneficial effect of the Act was being defeated. That kind of thing encouraged improper applications, and he must do all he could to stop them. The application was refused.

Extensive Housing Scheme for South London.

UNDER the instructions of the Bank of England and of the trustees of the will of the late Mr. Robert Jackson Bates, Messrs. Field, Sons and Glasier, of London Bridge and Waterloo Place, have effected a sale to the trustees of a fund for the housing of the working classes of the extensive island site in Rodney Road, Walworth, which occupies a ground area of over 61,000ft., and has frontages of over 1,000ft. to Rodney Road, and the contiguous streets. From information supplied by the secretary of the Fund, we understand that, according to the present intentions of the governors, it is proposed to develop the site by the erection of nine blocks of artisans' dwellings, containing each twenty tenements, and affording accommodation for more than 600 persons. As the property is no great distance from the large Tabard Street area which the London County Council are about to clear, it is believed that these new dwellings, when erected, will assist in solving the re-housing problem which will be presented by the Council's demolition scheme.

NORTHERN CONSERVATIVE
CLUB, NEWCASTLE-ON-TYNE.

This building, in Pilgrim Street, New-
castle-on-Tyne, is now being completed.
The architects are Messrs. Cackett and
Burns Dick, F.F.R.I.B.A. The details of
the scheme have been worked out in con-
sultation with Sir Walter Plummer and
Messrs. J. R. Hedley and T. E. Ruddock,
chairman and vice-president of the club.

The ground floor comprises a good en-
trance hall, reception room, and large
smoke room, with ample cloak and lava-
tory accommodation, the staircase and
passenger lift being about midway be-
tween the front and rear apartments;
while on the first floor, which may be con-
sidered the principal floor, are reading
and private dining rooms, and the most
important room in the building—the din-
ing hall, about 64 ft. long by 27 ft. wide,
and lofty enough to provide a mezzanine
floor with balcony overlooking the room.
The approach to this room is shown by
the accompanying view.

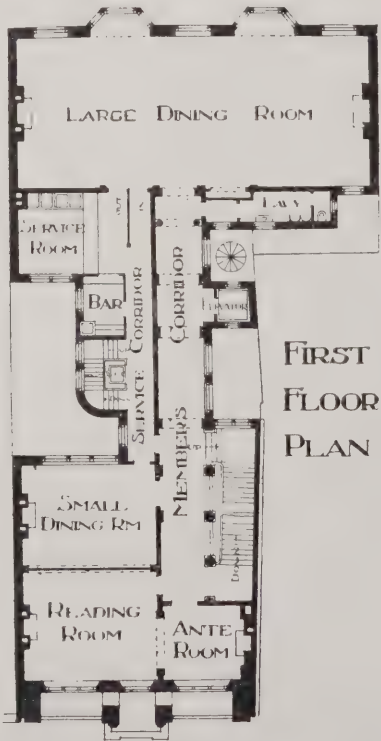

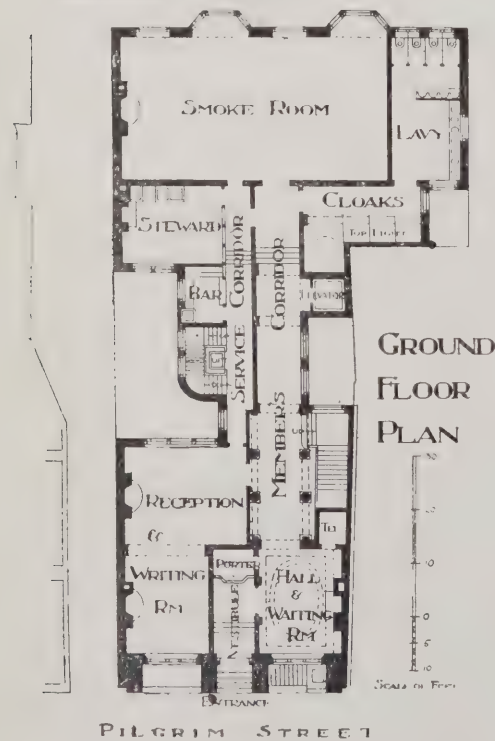

The second floor consists of two billiard
rooms (three tables), card rooms, etc., and
on the third and fourth floors are ten bed-
rooms for members, with bathroom ac-
commodation, servants' bedrooms, etc.

The lower ground or basement floor is
efficiently equipped with cooking and
heating appliances, and has administra-
tive and staff apartments very complete in
arrangement. A special feature of the
planning is the way in which the service
arrangements on the principal floors are
contrived to avoid contact with the mem-
bers' corridors, whilst affording the most
speedy and effective service to the club
rooms.

The building is substantially con-
structed, fire-resisting throughout, and

View of staircase on first floor and corridor leading to dining-room.

NORTHERN CONSERVATIVE CLUB, NEWCASTLE-ON-TYNE CACKETT AND BURNS
DICK, F.F.R.I.B.A. ARCHITECTS

finished in a quiet, club-like manner
in appropriate material such as is
found in the solid dignified work
of the designers of the Georgian period.
A somewhat unusual feature externally
is the treatment of the two lower
storeys, which are recessed, as the
result of practical necessities. In thus ful-
filling a requisite purpose, interest is lent
to the elevation, and a useful and appro-
priate balcony opening out of the first-
floor rooms is made possible. The fine
open position of the site, with Hood Street
opposite disclosing a view of the façade
from Grey Street, fortunately makes pos-
sible a proper estimate of the design—a
possibility too seldom the case in ordinary
town streets.

The general contractors are Messrs.
Stephen Easton, Ltd., of Newcastle. The
marble work is by Messrs. Emley and
Sons, of Newcastle; the heating, plumb-
ing and electric lighting by Mr. R. W.
Cairns, of Newcastle; the sculpture work
and balcony railing on the front elevation
by the Bromsgrove Guild, of Bromsgrove;
the iron balustrading to the main staircase
by Messrs. Spital and Clark, of Birming-
ham; the painting, decoration and glass
by Mr. G. Laidler, of Newcastle.

MAGAZINES AND REVIEWS.

The "Art Journal" contains an article on "Tewkesbury," by Mr. R. E. D. Sketchly, not so much on the famous Abbey Church (though a large illustration of a part of the interior is given) as of the general picturesque elements in the town—the bridge and the streets and houses. Most of the illustrations are by Mr. Cameron, and are very effective; but any article on Tewkesbury ought certainly to have included an illustration of the finest thing to be seen there, the great many-ordered Norman arch of the west front. An article on "The Wertheimer Sargents" affords the information that the splendid picture, "A Vele Gonfie" ("In full sail"), exhibited some years ago at the Academy, and one of the finest things Mr. Sargent ever painted, is also a Wertheimer portrait. There are no less than twelve portraits of members of the Wertheimer family, all in Mr. Sargent's best style; and certainly modern art owes something to a family who gave this great painter so many opportunities. In some remarks at the close of the article, on the characteristics of Mr. Sargent's art, we entirely concur. We cannot concur in the praises bestowed by Mr. Baldry, in another article, on the new spandrel paintings in the great hall of Bridgewater House, which we had an opportunity of seeing not long ago.

The "Burlington Magazine" returns to the charge in regard to the proposed national memorial to King Edward VII., with renewed contemptuous references to the Albert Memorial as a thing "that fills us with shame and disgust." This kind of language about a memorial which includes such sculpture as Foley's "Asia" group, and Armstead's two sides of the bas-reliefs, and which as a whole is a fine and novel architectural conception, is absurd exaggeration, and only calculated to lower our estimate of the judgment of the critic who makes use of it. What the "Burlington" critic wants, we presume, is that the competition should be presided over, and the selection made by a clique of the ultra-modern faddists in art. It is to be hoped that no such result will come about. National memorials should represent what is sane and central in artistic ideals, not the eccentricities of the moment, such as those of the Grafton Gallery exhibition, which find an apologist and defender in another article in the same issue. Some illustrations of "Oxyokes in the North of Portugal," accompanying an article on the subject, are very interesting as examples of popular decorative craft.

In the "Nineteenth Century," that accomplished sculptor Mr. Reynolds-Stephens writes on "A Plea for the Nationalisation of our Sculpture." What the writer appears to want, in the first place, is national patronage for English sculpture, in which he is entirely right; there is, in fact, no such thing, and one reason why French sculpture is (at present) superior to that of any other country is that the Government give such ample encouragement and opportunity to the sculptors. When Mr. Reynolds-Stephens urges that our sculpture should be national in another sense—should endeavour to shake off foreign influences and be a school in itself, and should deal with national subjects, we are not so sure. National subjects would no doubt be those which Government patronage, if we had it, would mostly demand; but the public would be interested in a subject that was interesting in itself, independent of

nationality. It must be remembered that sculpture is in any case a very difficult art to understand, much more so than painting; it is more symbolical and less realistic. And then, a the writer says, the English public is not accustomed to the nude, which must always be the highest effort of sculpture; he thinks they are not so much prudish as ignorant; they do not understand why a statue should be nude when real life is not. On the other hand, we entirely agree with him that there is no value in mere life studies that contain no poetic suggestion. Our impression is that the comparative weakness of English sculpture results from three causes—(1) that already mentioned, the want of State patronage and encouragement; (2) the inadequate manner in which it is represented at the Royal Academy, where it is crowded into a small space and cannot be fairly seen; and (3) in a certain prosaic element in the English character which affects public and sculptors alike. In a French exhibition we constantly find poetic conceptions symbolised in sculpture; in an English exhibition this is far more rare; or if the attempt is made, there is a want of intensity about it. The sensation made by Carpeaux' "La Danse" when it was exhibited at the Academy arose not so much from its power of technique as from the intense and wild energy with which the subject was treated; a kind of intensity which seems foreign to the English nature, and which, in fact, in that instance, almost startled the English spectator. That is an innate deficiency which it is difficult to escape from. But English sculpture will never have a fair field until the State does for sculpture here what the neighbouring State does across the Channel.

In the same issue is an article by Captain Swinton on "A King Edward Bridge," which is the proposal, that has already been put forward and even illustrated, for a great new roadway bridge across the Thames, to take the place of Charing Cross bridge, the station being transferred to the south side of the river. The author thinks that one result of such a bridge would be the development of a great quarter of fine buildings on the south side of the Thames; he asks, "Why are all our great buildings on one side of the river only?" Well, it is partly a kind of tradition from the fact that the land on the south of the river was formerly a water-logged, marshy district, not favourable to great buildings. A beginning has now been made with the new County Hall, and probably further architectural development on that side would follow. We agree that the proposed new bridge would be a great influence in favour of such a result. The article is worth attention.

The "Antiquary" contains an article on "A late Celtic Cemetery at Welwyn, Herts," with a map, and "Notes on the Older Eastbourne," by Mr. J. C. Wright. Many people who go to the very modern Eastbourne as a holiday place have little idea how much historic interest there is in the neighbourhood in connection with Old Eastbourne. It is to be hoped some of them will benefit by Mr. Wright's article, though we fear few holiday-makers pay much attention to the older history of the watering-places they visit.

The "Architectural Record" (New York) contains an article on what is called "the new architecture," which means, apparently, the high commercial building designed with no other purpose than to get the greatest floor space and the greatest return for the outlay. The writer maintains that this is the only

"commercial architecture" which is truly such; that no other country possesses a commercial architectural style properly so called. We think there is such a style in England, only we call it mill-building, and not architecture. At all events, to distinguish such erections, as constituting "the new architecture" is using rather big language for a very commonplace style of edifice. The description of the construction of these buildings is of some practical interest, but the illustrations of them form a dull spectacle.

The "Cornhill" contains an article by Mrs. Barnett, "Of Town Planning," the scope of which, however, is rather social than architectural. The only point in it which is new, and which bears upon amenities of effect in town planning, is the suggestion that solid walls are unnecessary as boundaries to gardens, and keep out sun from the gardens, besides preventing the gardens from being a source of pleasure to those outside the barrier. There is a good deal of truth in that.

MANCHESTER SOCIETY OF
ARCHITECTS.

MR. ALBERT H. HODGE ON
ARCHITECTURAL SCULPTURE.

At a meeting of the Manchester Society of Architects on Wednesday last, January 11th, Mr. Albert H. Hodge read a paper on "Architectural Sculpture" before a large attendance of members.

It was a great mistake, Mr. Hodge said, to think of architectural sculpture as a form of decoration applied only to buildings, and as secondary to the bust and portrait statue. Each has its place in the world of utilitarian art, must be subservient to the principles of architecture, and must have truthful construction, balance, scale of parts. Sculpture, when part of an architectural motive, should be so closely allied to its setting, that to strip one piece of it is to rob the composition of a necessary "factor of scale." How were we to bring about this oneness of mind and motive? When he studied the problem, he felt that the greatest quality of a piece of sculpture was scale. It was better to err on the small side when fixing the size of figures, than to make them too large. In the former case the figure only suffers, whereas in the latter the whole building is dwarfed.

The placing of sculpture on our buildings ought to be considered when the façade is conceived in the mind, and should not have the appearance of being added. The Parthenon pediment was not an after-thought, nor were the friezes an extra. To obtain a monumental feeling, we should have to look up slightly to the sculpture. When used low down, it should be severe or Egyptian in character.

Mr. Hodge analysed the sculptures of the Parthenon pediment, and showed how the expression was graduated from Helios rising from the sea at one side of the pediment to the birth of Minerva in the centre, the action of the figures increasing as the central group was approached, and decreasing towards the quiet Selene on the other side. He instanced many other Greek sculptures designed on architectural principles, a portion of the Panathenaic frieze being planned with the wave ornament as its motive, and another part with square outlines on the basis of the fret ornament. The whole motive becomes slower and steadier as it approaches the main entrance, where

the assembled gods are seated. We ought to realise the limitations of sculpture and architecture, and not make our sculpture represent life models. It should look as if it were cut out of stone, not built up of small pieces. Egyptian work owes its austerity to this quality. Modern French work looks as if it were clay modelling. Straightness of drawing and truthness of surface are always found in the work of a master; rough lumps of stone left to make the adjoining parts look refined are tricks unworthy of sculpture. Style in our work is simply the outcome of true form.

He wished to point out the great loss to architecture by an estrangement from sculpture. He appealed to architects to draw closer the bond. Architecture realised its highest flights when it used sculpture in the proper way. Without sculpture it might be fine, with sculpture it is supreme.

J.T.H.

BRISTOL SOCIETY OF ARCHITECTS.

A meeting of this Society, open to members and their friends, including ladies, was held on January 9th; the president, Mr. Foster Wood, in the chair.

A lecture was given by a member and former honorary secretary of the society, Mr. F. Bligh Bond, F.R.I.B.A., Diocesan Surveyor of Bath and Wells, whose subject was "Somerset Churches," and a very fine collection of about a hundred lantern views was shown.

The lecturer was of opinion that the Perpendicular style and its transition from the Geometrical was developed in these churches at a very early date. Somerset, indeed, may be regarded as the home of this phase, and it was probably carried thence by ecclesiastics to the Midlands, East Anglia, and other parts of the country. Another beautiful feature of the Somerset churches is that of the characteristic square towers built as a result of the wonderful perfection in campanology attained during the fifteenth century. Many interiors were illustrated and described specially with reference to the Celtic and Saxon types of planning, as they affect the screening of the chancel and width of its arch.

Examples were shown of Jacobean and Carolean screens, which, as at Croscombe, include praiseworthy attempts to replace, in measure, the work destroyed by the decree of Queen Elizabeth, who ordered all rood lofts to be taken down. Even some of the early Hanoverian work may be considered fairly harmless, but anything later than the first George was usually incongruous and debased.

On the motion of Mr. G. C. Lawrence, a very hearty vote of thanks was accorded to Mr. Bond for his lecture.

FIRE PROTECTION FOR WOODEN STRUCTURES.

Fire protection for wooden bridges in Canada is required and regulated by the Canadian board of railway commissioners. An order concerning the work has been issued, applying to all trestles the whole of which cannot be seen from an approaching train for a distance of at least 1,000ft. During the months of May to October, inclusive, one of the following methods of protection must be enforced: Keeping watchmen at the structures; the track-

patrolling system; fire-alarm signals; ballast flooring; zinc covering of caps, stringers, and batter posts, and the use of fireproof paint, equal in efficiency to a certain standard and applied at least once every five years. In addition water barrels must be kept at one end of trestles of less than 30ft. in length, at both ends of trestles longer than 30ft., with intermediate barrels at intervals of not more than 150ft., except in the case of pile trestles over streams or other bodies of water. These barrels are to be kept filled with water, within 10 inches of the top. The water barrels must be maintained in good repair, pails must be provided, and where watchmen or track-walkers are employed, pails must be carried by them during their inspections.

Where protection is provided by watchmen or by trackwalkers, all trestles on the main line must be inspected at least twice every 24 hours, and on branch lines once every 24 hours. Brush and dead grass must not be allowed to accumulate around trestles. Railway companies failing to comply with these regulations will be subject to a fine of \$30 for each offence, and watchmen or track-walkers who fail to make inspection in accordance with the regulations are liable to a fine of \$15 for each offence. Where ballast flooring is the means of protection the ties must be completely covered with gravel level with the underside of the rail head. It is required that the fire-alarm signals must be equal in efficiency to the Montauk thermostat.

COMPETITIONS.

York Road Schools, Battersea.

In the recent competition held for the above, the designs submitted by Messrs. George Baines and Son, of 6, Clement's Inn, Strand, London, W.C., have been placed first, and the work is to be proceeded with at once.

Elementary Schools, Edgeley, Stockport.

The assessor, Mr. J. W. Simpson, F.R.I.B.A., has made the following awards in the limited competition for the above schools:—(1) Messrs. Reginald H. Spalding and Ernest G. Theakston, of London; (2) Messrs. Cheers and Smith, of Blackburn (£40); (3) Messrs. Crouch, Butler, and Savage, of Birmingham (£20).

LIST OF COMPETITIONS OPEN.

JAN. 21. SCHOOL FOR TAUNTON.—The Education Committee of the Borough of Taunton invite architects practising in that borough to submit designs for a provided school for 440 children. No premium is offered, but the author of the selected design may carry out the work at the commission of 5 per cent. Address George H. Kite, Town Clerk, Municipal Buildings, Taunton.

JAN. 30. BRISTOL. HOUSING AND COTTAGE EXHIBITION.—Particulars with respect to the competitions open to architects and builders may be obtained, not later than January 30, from Frank H. Bromhead, A.R.I.B.A., Leaze Cottage, Shirehampton, Bristol, hon. sec. The exhibition is to be held from September 4 to October 7, 1911.

JAN. 31. GLASGOW PUBLIC LIBRARY.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Saracen Street and Allander Street, Possil-

park. Premiums of £50, £30, and £25 respectively will be awarded to the authors of the designs adjudicated first, second, and third in order of merit. Designs must be lodged on or before Tuesday, January 31. Particulars from A. W. Myles, Town Clerk, City Chambers, Glasgow.

FEB. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK.—Particulars in our issue for October 12.

FEB. 1. SUITE OF OFFICES, HULL.—The Guardians of the Poor for Sculcoates Union offer premiums of ten guineas, six guineas, and four guineas for designs for a suite of offices to be built in Margaret Street, Hull. Apply to J. H. Wild, solicitor, Clerk to the Guardians, 12, Harley Street, Hull.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Premiums of £15 and £10 are offered. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee E. Pearson, Corbridge.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 26.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125, for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 8-12. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

NO DATE. CARNEGIE LIBRARY, PENISTONE. Particulars from Clerk to District Council, Penistone.

NO DATE. UNIVERSITY COLLEGE FOR SOUTHAMPTON.—It is expected that Mr. Henry T. Hare, F.R.I.B.A., will be the assessor. Further particulars are to be announced.

In publishing the drawing of Holy Trinity Church, Kingsway, in our issue for January 4th, we ascribed the design to Mr. Belcher only: whereas it should properly have been put over the joint names of "John Belcher, R.A., and J. J. Joass, architects."

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editors desire to give notice that answers to the following enquiries can no longer be undertaken:—

- (1) Enquiries about buildings to measure in particular towns and districts.
- (2) Enquiries embodying questions which have been set in examination papers.
- (3) Enquiries which ask for or require the preparation of special designs as part of the answer.

"Repetition" Work Based on Bills of Quantities.

"CONSTANT READER" writes: "A quantity surveyor is instructed to prepare bills of quantities for a cottage to cost £500, at the rate of 2½ per cent. on the estimated cost. The bills are prepared and delivered to the architect, who in turn forwards a cheque for £12 10s. to the surveyor. The latter now finds that the architect used the bills of quantities as a basis to obtain the price of four cottages; and as the contract amounts to £2,000, the architect will receive £50 for preparing quantities. What is the legal position of the surveyor? Is he entitled to claim the difference between £12 10s. and £50?"

—I do not think that the quantity surveyor will be well advised in pursuing this matter any further, as, to say the least, it is very doubtful whether he can recover

his fees under the circumstances detailed. I have not been able to find any decided case touching upon this question of "repetition work" in reference to the fees of a quantity surveyor. F.S.I.

Church of St. Oswald, Ashbourne, Derbyshire.

S. P. B. (SIDMOUTH) writes: "In what book can be obtained particulars concerning the Church of St. Oswald, Ashbourne, Derbyshire, and also Archbishop Walter Grey's Tomb in York Minster?"

—A very fine and complete set of measured drawings of Ashbourne Church, Derbyshire, by Mr. L. M. Gotch, gained the R.I.B.A. silver medal in 1905, and was published in the Architectural Association Sketch Book in that year. Methuen's "Little Guide to Derbyshire" is the readiest source of information as to its history. Archbishop Grey's tomb in York Minster is illustrated by measured drawings in the Architectural Association Sketch Book for 1885, and also by a set in the Building News, 18, viii., 1876. A good description is in the guide to York in Bell's Cathedral Series. G.

Contract Money Withheld Through Leaky Roof.

"ANXIOUS" writes: "The roof of a house erected a year ago has, with heavy rains, admitted a little water. The proprietor has kept back the sum of £10 contract and £5 extras money because of this, whereas the agreement was that all

money should be paid within a month of completion, the builder to give a three months' guarantee. Am I justified in demanding my money? I have endeavoured to remedy the defect."

—Your letter appears to show that the roof has not been perfectly weather-proof since it was constructed, and that the remedies you have tried have not been perfectly successful; therefore, as the builder, you remain responsible for defective workmanship, so that probably you would not succeed in obtaining your money if you demanded it until you can show that the roof is weather-proof for a reasonable period. Your best plan is to agree with the employer to have the roof examined by an independent expert, whose directions for further remedies, if any are required, you agree to carry out, and upon whose certificate that the work is sound, the employer agrees to pay. Such agreement should be in writing, and provision made as to who is to pay the expert's fees. A. G. W.

Prospects for Architectural Draughtsmen in Canada.

J. R. writes:—"Kindly give information with respect to the prospects of an architectural draughtsman in Canada."

—Our correspondent would do well to communicate with the Emigrants' Information Office, 31, Broadway, Westminster, where information concerning the prospects for architectural draughtsmen in Canada would probably be available. As a further precautionary measure, it would be advisable to advertise in the chief Canadian papers in order, if possible, to obtain some definite appointment before leaving this country. The papers we suggest are: "The Canadian Architect and Builder," and "The Globe," both published in Toronto.

Rendering Account for Variations.

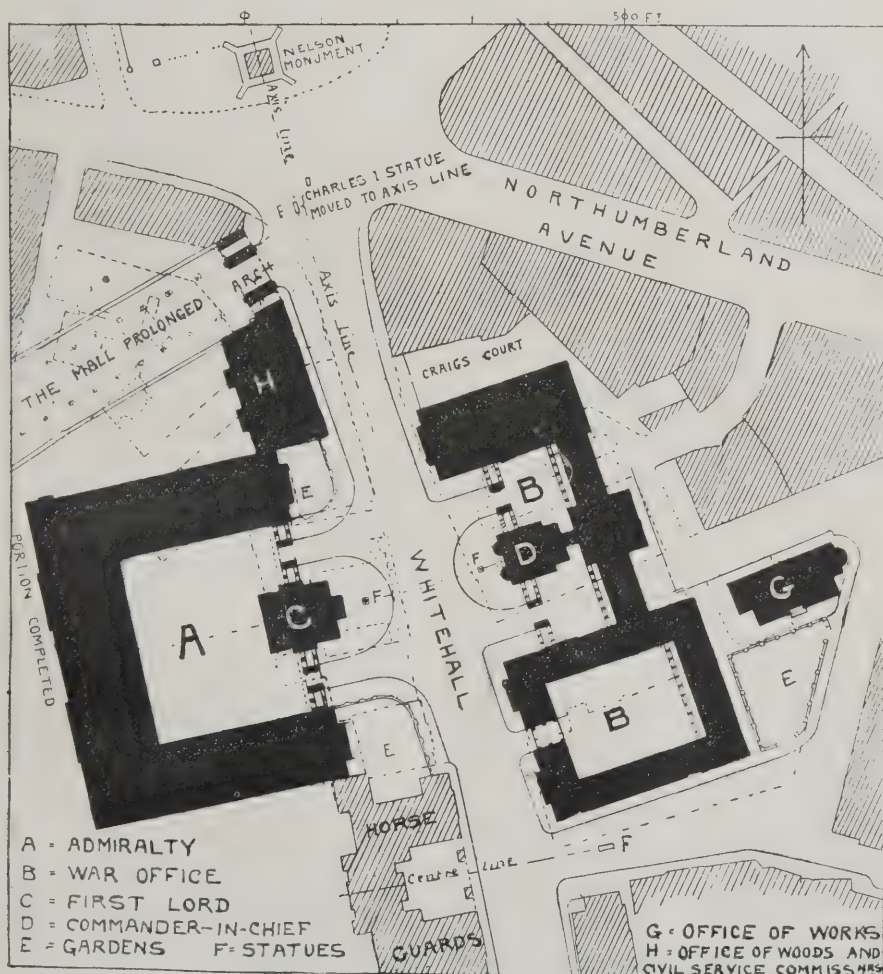

QUANTITY SURVEYOR writes: "Is there any legal machinery whereby a contractor can be forced to render his account of variations within a reasonable period from the completion of the work? My client is a business man, and naturally wants to know the extent of his indebtedness. The contractor, however, is so full up with work that he has not had time to get his account out. This is some time ago now, What do you recommend?"

—I fear that there is no particular legal machinery specially adapted for this purpose, but the architect's powers under the contract should be sufficiently clear to enable him to measure up himself if necessary. I advise that the architect should call upon the builder to furnish his account under the contract by a specified date, in default of which he will (1) measure up himself, and (2) issue his final certificate. Whatever procedure is adopted, it must be reasonable—the law always construes every contract by the aid of that word "reasonable." F. S. I.

Decreasing Width of Walls Above First Floor.

"SMETHURST" (Buslington) writes: "Would it be safe to build a milk factory, 50ft. by 20ft. by 25ft. high, in 14in. brickwork up to the first floor (14ft.), and then continue 14in. by 24in. piers, 10ft. apart, to carry 16in. concrete floor beams, filling in between piers with 9in. brickwork?"

—Further particulars (and especially a cross-section) would have been useful in answering this question. Though it is stated that the building is 25ft. high, and that the height to first floor is 14ft., the piers above that level are said to carry 16in. concrete floor-beams, so that pre-

This is the block plan which was referred to and described in Mr. Statham's paper read before the Architectural Association, and printed in our last issue. As a plan which excited some attention at the time, it may be of interest to our readers. The description of it will be found on page 52 of our last issue.

(Reproduced from the R.I.B.A., Journal of April 15th, 1897.)

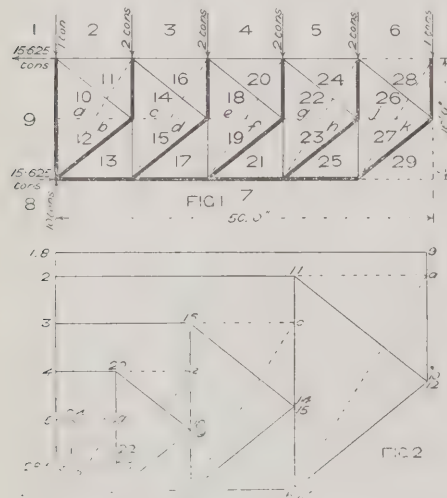

SUGGESTED PLAN FOR THE WAR OFFICE AND ADMIRALTY, BY H. H. STATHAM, F.R.I.B.A.

sumably there are three storeys, the top-most one in the roof, unless a flat roof treated as a floor is meant. Taking a floor load of $2\frac{1}{2}$ cwt. per foot super, and a safe load on brickwork in piers (stocks in lime mortar) of 4 tons per foot super, this latter figure is seen to be exceeded, the actual load working out at $5\frac{1}{2}$ tons per foot super from one floor alone, exclusive of the additional weight of roof (if any). The first floor construction presumably is of joists spanning from wall to wall without main beams, and for this distributed load alone (without the load transmitted from above) the 14in. wall should prove ample. An increase in the size of the piers above the first floor to 2ft. 3in. by 1ft. 6in., and their continuation below of similar size, should make the construction safe, provided no roof thrust has to be dealt with. G.

Diagram for Braced Cantilever.

B. (LONDON) writes: "I want to support a distributed load of 10 tons on a cantilever, braced as shown on drawing (not reproduced), but cannot get a stress diagram to close or show any stress in the centre boom. I find no difficulty in drawing the stress diagram for lattice bracing without the centre boom."

—The frame diagram of the cantilever, with the loads given by querist, will be shown in Fig. 1, and in order to work out a stress dia-

gram, substituted members shown by the dotted lines must be used. The stress diagram, Fig. 2, may then be readily worked out, and it will be seen that the central horizontal member has no stress at all.

HENRY ADAMS.

Painted Plaster Blackboards.

H. N. (NORTHAMPTON) writes: "It is proposed in a secondary school to have blackboards on one side of each class room, and grounds have been fixed to finish plaster to the back of blackboards. What do you consider the most satisfactory filling to use, and how should it be finished? Parian finished with lamp-black and gold size has been recommended, but I do not know the proportions."

—The objection to the use of lamp-black and gold size is the difficulty of keeping the mixture from drying glossy in patches. A better method is the application to the plaster backing of Ripolin, Paripan, or similar enamel (egg-shell flat quality) to which an addition of fine pumice powder, one part by weight to four of paint, has been added and well mixed in. The pumice powder is of the ordinary kind as used in felting down, and the painting can be done in the ordinary way. As a background, Parian or Keene's cement will be suitable—if the

latter, it should receive one coat of red lead and boiled oil while freshly done.

G.

Measurement of Polishing.

O. K. (ST. ANNES) writes: "I have recently supplied and fixed a large quantity of oak panelling and dado. The polishing was agreed to be done at a given price per ft. super. What is the correct method for measuring the polishing? I have measured the cornice and skirting at per foot run, and the panelling at per foot super. In measuring, I have girthed all moulds, muntins, rails, edges, returns, etc. We differ, however, in the following respect. My polisher wants an allowance of one inch in length and width of every panel over the ordinary measurement. That is to say, a framing 3 panels high and measuring in the ordinary way 7ft. 6ins. he claims 7ft. 9ins., and if, say, 8 panels wide, girth measured 10ft. 3ins., he claims 10ft. 11ins., his reason for this being that the panels were bodied in and partly polished before being fixed in the framing, consequently he measures to the edge of the panels in the groove. What is the usual custom?"

—The method of measurement described is that usually followed, and the allowance claimed by the polisher would be unreasonable under ordinary circumstances. Work is usually specified "Polished on all exposed surfaces." Unless special orders were given the bodying-in of the panels was presumably done before fixing for greater ease of manipulation. X

Laying a Brick Rubble Tennis Court.

G. S. H. (LONDON, S.W.) writes:—"Please give particulars for laying down a brick rubble and 'kilm dust' lawn tennis court."

—To construct a brick rubble tennis court the ground should be levelled over an area of 120 ft. by 50 ft. and thoroughly drained; then a layer of rough brick rubble or clinkers 4 in. to 6 in. thick should be laid over the ground, this to be covered with a layer of broken brick rubble to pass through a 2 in. sieve. The top layer to be kiln dust or hard engine ashes about $1\frac{1}{2}$ in. thick, thoroughly rolled and consolidated. The kiln dust can be obtained from any brick-field by arrangement. It is advisable to have grates for carrying heavy rainfalls, though if properly constructed these are not absolutely necessary. The drains underneath the rubble ought to be filled with rough material to ensure quick passage of water from the court.

Strength of Wall for Effluent Tanks.

N. B. (BATLEY) writes: "I enclose herewith a plan [not reproduced] showing a brickwork water purifying plant, upon which I should like your opinion as to its strength for the intended purpose. The two tanks (the main tank and the filter) are to contain together about 10,000 gallons of water. The sludge filter need not be taken into consideration. What I shall be pleased to know is, whether the walls are strong enough for the purpose. They would be built of good bricks in cement. The small trough over the large tank does not enter into the calculation."

—The weakest part will be in the centre. The accompanying diagram shows the effect of the water pressure on the division wall of the main tank wall next to sludge filter, between tank and filter, the resultant cutting the base at 2.6ft. from its centre. Then

$$\frac{W}{A} + \frac{M}{Z} = \frac{9.75}{1.5} + \frac{9.75 \times 2.6}{\frac{1}{8}(1 \times 1.5^2)}$$
$$= 6.5 + 67.6 = 74.1 \text{ cwt. or } 3.7 \text{ tons per sq. ft.}$$
compression and 61.1 cwt. or 3.05 tons per sq. ft. tension. The division wall ought to resist this safely, and the same stresses will occur at the same depth of the outer wall, but this wall is unsupported for some 4ft.

deeper. If the pipes were built in with their flanges close to the wall, they would give additional support. Iron ties might also be built into the wall and the concrete bedded round them.

HENRY ADAMS.

Hotel Planning.

E. W. L. (BRIGHTON) writes:—"Can you inform me of any publication on the planning, construction, and equipment of modern first class hotels?"

—We are not aware of any book on modern hotels. A paper entitled "Hotel Planning" was read by Mr. Stanley Hamp before the Royal Institute of British Architects on April 8, 1907, but this is now out-of-print and unobtainable.

CORRESPONDENCE.

Ruislip Estate Scheme.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—With reference to your leading article in your last issue, in which you describe the first-premiated plan for the Ruislip Manor Estate, we desire to draw your attention to a trifling misstatement. In describing the treatment proposed for Windmill Hill, you state that a reservoir is suggested situated on the top of the Hill. It was not our intention to make this provision, and it is probable that you mistook the word "reserved" for "reservoir" on the plan. As will be seen from the précis of our report printed in the same issue, two plots are proposed to be reserved for fire station, public library, or other such building. However, the accidental suggestion is not without value, and we thank you for it.

Yours faithfully,

A. AND J. SOUTAR.

Wandsworth.

Waring and Gillow, Ltd.

A circular has been issued to the shareholders in this company requesting their attendance at an Extraordinary General Meeting to be held on January 26th, at the Cannon Street Hotel, for the purpose of considering a resolution for the appointment of Mr. William Plender, President of the Institute of Chartered Accountants, as Liquidator pending the consideration of a reconstruction scheme, and we are informed that a circular will shortly be issued calling a meeting of creditors. As some misapprehension has been expressed, the Directors desire to repeat that the business is being carried on in all its branches as usual.

NEW BOOKS.

Sanitary Law.

It would be an immense advantage to have the bewildering number of Acts relating, casually or specifically, to sanitary law consolidated or codified, so as to afford those who have to obey them a reasonable chance of becoming aware of their existence, if not of understanding them. Dr. Porter, who has a twofold qualification for the task, being at once a medical officer of health and a barrister-at-law, has produced for the use of students of public health a handbook that at least indicates a narrow pathway through the morass, and will probably serve other uses besides those to which it is professedly dedicated. It is thrown into the form of question and answer, a method that has much to recommend it, and was at one time in universal use in educational books—as our grandparents, with reminiscences of “Mangnall’s Questions,” “Pinnock’s Catechism,” and of sundry little books on architecture, could testify. The method, though long ago discarded, seems to be educationally sound, a printed question being an unrivalled means of stimulating attention and concentrating the mind upon specific points, and Dr. Porter employs it with excellent effect. The book, although of slender proportions and low price, must have involved an immense amount of labour in the preparation; whereby Dr. Porter has earned the gratitude of all whom he thus absolves from the heart-breaking task of digesting the law for themselves. The book is of equal value to public officials entrusted with the administration of the sanitary laws, and those persons who, like architects and builders, are compelled to meet official requirements.

Sanitary Law in Question and Answer.—For the use of Students of Public Health. By Charles Porter, M.D., B.Sc., M.R.C.P. (Ed.), of the Middle Temple, Barrister-at-Law, Medical Officer of Health, Marylebone, etc. Longmans, Green, and Co., 39, Paternoster Row, London; New York, Bombay, and Calcutta. Pages xiv.—150. 5½ins. by 7½ins. 2s. 6d. net.

A Guide to Valuation.

Primarily written as a text-book for students and candidates essaying the examinations of the Surveyors’ Institution, Auctioneers’ Institute, etc., Mr. Clarence A. Webb’s book on “Valuation of Real Property” must nevertheless have fulfilled its author’s hopes that it would also be found of use to house, land, and estate agents, and to others who are beyond, or are at least outside, the state of pupillage; for we now have it in a second edition, revised and enlarged, with the important addition of a chapter on the new land values taxation included in the Finance (1909-10) Act, 1910; and there are suggestions as to the filling of Form IV.

In the first chapter, the principles of valuation are very clearly set forth, and exemplified with respect to various tenures and interests by means of typical cases. Other chapters relate to the value of land and buildings taken separately, valuation for mortgage, timber measuring and valuing, arbitration, compensation for compulsory purchase, valuation for rating, valuation for taxation, enfranchisement of copyholds, compensation under the 1904 Licensing Act, and valuation for fire insurance claims. A final chapter treats of the construction of valuation tables, of which several useful examples are included. Architects and builders, as well

as those to whom the work is perhaps more specifically addressed, will find it very informing on subjects with which they ought to possess at least a fair degree of familiarity. They will find Mr. Webb at once a luminous and a safe guide.

Valuation of Real Property.—A Guide to the Principles of Valuation of Land and Buildings, etc., for various purposes, including the Taxation of Land Values. With numerous examples. By Clarence A. Webb, valuer and rating surveyor, Professional Associate of the Surveyors’ Institution, etc. Second edition, revised and enlarged. London: Crosby, Lockwood and Son, 7, Stationers’ Hall Court, Ludgate Hill, E.C., and 121A, Victoria Street, S.W. 5½ins. by 8½ins. Pages xii.—332. Price 7s. 6d. net.

An Encyclopædia of Municipal and Sanitary Engineering.

For this work it is claimed, with perfect justice, so far as we are aware, that it is the first of its kind. The literature of the subject is voluminous, municipal and sanitary engineers being remarkably prolific in authorship; but the innumerable papers, reports, articles, pamphlets, and other treatises they have produced make, in the aggregate, a chaotic and altogether unwieldy mass, in which a vast amount of exceedingly valuable information lies almost hopelessly buried. To Mr. W. H. Maxwell and Mr. J. T. Brown has occurred the happy idea of digesting this mass of materials; and the result appears in a handsome volume of moderate cost, in which the whole subject, in its various phases, is dealt with in the only really practical way—that is, in the form of an encyclopædia, in which the alphabetical arrangement, while it necessarily involves a certain amount of repetition and overlapping, is undoubtedly the most convenient method for reference. The editors, who have enlisted the co-operation of about forty contributors of unquestionable authority, have adopted the fair and wise course of affixing the initials of the authors to the more important articles—fair, because it is due to the respective writers to give them full credit for their work; wise, because the value of the information in any given instance can be more properly appreciated when one knows who is responsible for it—a point that is of special importance where systems or methods are sometimes in rivalry.

The volume, so far as we have been able to test it, has been conceived and carried out in the right scientific spirit. For a one-volume encyclopædia, it is not over-bulky; and by the use of smaller type and smaller-scale diagrams, and by the more rigid condensation of the articles, some of which show a tendency to elaboration, as if the authors had not quite overcome the lecturer’s habit of discursiveness, the book might easily have assumed still more modest proportions. In that case, however, it would inevitably have lost much of its present handsome appearance, to say nothing of its legibility; but as the subject continues to grow, such methods of compression as we have ventured to indicate will probably become necessary. We should have liked to see more attention given to what may be called the bibliography of the subject. Although many of the articles are, as we have said, unusually copious, one cannot reasonably look to an encyclopædia for absolutely exhaustive treatises under the various headings, but rather for concise summaries, with indications of the sources of other and fuller investigation. It may further be suggested that an analytical index would have been useful; for although the articles are, of course, in alphabetical

order, it frequently occurs that one does not always know off hand under which heading to look for certain items to which the article-heading offers no precise clue—a deficiency that a good analytical index would supply. This difficulty, however, has been anticipated, and partly met, by the insertion, in bold type, at the head of some of the sections, of a sort of syllabus of the contents; which, however, does not answer the purpose of a good index. The volume, nevertheless, fulfils a distinct want, and municipal and sanitary engineers will be grateful for it.

The Encyclopædia of Municipal and Sanitary Engineering.—A Handy Working Guide in all matters connected with Municipal and Sanitary Engineering and Administration. Edited by W. H. Maxwell, A.M.Inst.C.E., and J. T. Brown, M.R.San.Inst. London: Constable and Company, Ltd., 10, Orange Street, Leicester Square, W.C. 562 pages. 8ins. by 10½ins. 42s. net.

An Introduction to the Chemistry of Paints.

In no subject, with the doubtful exception of cement and its uses, has greater or more rapid progress been made of recent years than in that of the scientific investigation of the physics and chemistry of paints. As the author of this treatise observes, “the very name of chemistry is enough to frighten many practical men, for the simple reason that the majority of chemists will persist in laying such stress on symbols and formulæ, atoms and molecules. The consequence is that, before the student can begin to acquire a really practical and useful knowledge of chemistry, he has to wade through and memorise a number of (to him) dull and isolated facts, which might well be left out altogether, or at any rate reserved until the student has reached a more advanced stage. As the practical man has neither time nor inclination to do this, he not infrequently leaves chemistry severely alone, and therefore fails to appreciate its value and importance.” This is undoubtedly true; and, as the author would be probably among the first to acknowledge, it is usually as difficult to persuade the gods to come down from Olympus, leaving their formulæ behind them, as it is to induce the “practical man” to attempt the ascent. Consequently there is some danger of a mutually mischievous estrangement between the chemist and the practical man—the former lacking a good deal of the practical knowledge, the latter missing the scientific tips that would be invaluable to him in practice. Dr. J. Newton Friend approaches his subject in full knowledge of the needs of the situation, and consequently he has produced a book in which much valuable information is plainly and intelligibly imparted to the student, the painter, the manufacturer, and the colour mixer. The architect would be none the worse for a perusal of this compendious manual, which will tell him, for instance, exactly why certain pigments are inherently incompatible, and must therefore never be used in conjunction; how various annoying occurrences—cissing, cracking, peeling, pitting, ropiness, tackiness, and so forth—arise, and hence how they may be avoided. Altogether, it is a very useful little book, produced by a chemist having thorough knowledge, and the happy knack of retailing it for practical application.

An Introduction to the Chemistry of Paints. By J. Newton Friend, Ph.D. (Wurz.), D.Sc. (B’ham). With diagrams. Longmans, Green, and Co., 39, Paternoster Row, London; New York, Bombay, and Calcutta. Pages x.—204. 5ins. by 7½ins. 3s. 6d. net.

FIRE PREVENTION NOTES.

*Neglected
Precautions.*

An obvious truism, which with many another plain and incontrovertible fact is commonly ignored in practice, is that "if a fire has nothing to feed on, it will not spread." Yet we go on loading buildings with woodwork. With regard to fire extinction, it has been pointed out that the best form of construction is that which keeps the fire in full sight when once it has started. Where woodwork is involved, however, the greatest obstacle is that of locating the fire, which may send out smoke from a dozen places, through the hollow walls, and from floor to floor. But whilst the spread of fire from room to room is appallingly rapid where the partitions and doors are constructed of wood, the walls in concrete construction are absolutely incombustible, and a concrete partition, providing that the necessary openings for windows and doorways are closed with metal doors and ribbed glass windows, affords a natural barrier against the spread of fire. The sudden breaking-out of fires will go on for ever; but, with proper construction, it will always be possible to have the fire in full sight, so that it can be instantly seen and attacked. With the use of fireproof doors the horizontal spreading of fire can be pretty easily checked; such doors at least confining an ordinary fire to one room until it can be handled. The vertical spread, however, is more difficult to deal with, stairways and wells tending to aid its progress. It is, however, quite possible to keep combustible goods away from such openings. And stairs and rails may be made of concrete; and, where possible, wired glass should be used for the windows.

The shocking railway disaster which happened at Hawes just before Christmas, was so horribly complicated by fire as to lead to an instant general enquiry as to whether by any means this additional danger can be prevented. In the course of this enquiry, it was recalled that the Board of Trade has no statutory power to impose regulations on the railway companies, the utmost influence it can exert being in the form of recommendations. The Board, however, will no doubt feel compelled to issue some manifesto on the subject, and this, if based on trustworthy expert opinion, will no doubt receive due attention. A correspondent of the "Times" seems to think that very little can be done beyond providing fire-extinguishers, and axes or other implements for forcing an exit. He suggests, however, that the mischief wrought by fire being greatly increased, if not actually introduced by the gas which is so largely carried for illumination, the substitution of electric light on trains would greatly reduce the risk from fire. But electricity also has its special dangers.

*Relief Appli-
ances Abroad.*

In Canada and in the United States, it is compulsory that appliances for rescue and relief shall be carried on the trains. There, however, the trains constantly run through enormous tracts of country even much more remote from the haunts of men than is the scene of the disaster to the Scotch express; whilst in this country the unoccupied areas are so small that the carrying of

relief appliances has not hitherto strongly suggested itself as a necessary precaution. The "Times" Paris correspondent writes that "it would be nearly as futile to discuss life-saving appliances on French railways as to write about the snakes of Ireland." At present, he says, the Paris-Orléans Railway, has the most modern rolling stock, but, beyond the occasional presence of a few portable fire-extinguishers in the corridor carriages, there is no visible display of appliances for dealing with an emergency. On the great system of the Nord Railway such appliances are seen, but they are only to be found in the through German corridor carriages which arrive daily on the expresses from Berlin or Cologne. Many of these carriages not only contain the little locker behind the glass panel in which are an axe, a coiled rope, and other articles for use in emergency—they also exhibit directions for opening the plate-glass windows outward in case of accident. These precautions were introduced in Germany a few years ago, after some lives had been lost by fire following upon an accident.

*Precautions in
Prussia.*

The accident and fire precautions observed in Prussian express trains are enumerated by the Berlin correspondent of the "Times" as consisting of the provision of a fire-extinguisher filled with carbonic acid, and a hatchet and saw hung in a glass-fronted case on the corridor wall of every carriage. The illuminant is sometimes electricity, generated by a dynamo carried underneath the locomotive, and sometimes gas which is carried underneath the carriages in tanks, which are filled from reservoirs at the stations. The large windows usually seen on Continental railways were introduced in Prussia mainly with a view to easy escape in case of accident. Several correspondents concur in the opinion that if such appliances as saws, axes, sledge-hammers, and small screw-jacks had been available on the Scotch express, suffering and loss of life might have been avoided.

*Is a Fireproof
Train possible.*

It is rather surprising that, in the course of the extensive discussion of the Hawes Junction railway accident, nobody seems to have suggested that the railway carriages themselves ought to be, and might be, constructed with some regard to incombustibility, so that instead of igniting with the utmost facility at the first opportunity, they would offer considerable resistance to fire. We venture to throw out the suggestion that, at the forthcoming Building Exhibition, some of the manufacturers of fire-proofing specialties might make a very attractive exhibit in the form of a railway carriage constructed on fireproofing principles. There seems to be no reason why the adoption of minor preventive measures should be much more impossible or much less effectual in the case of railway carriages than in that of stationary buildings. Of course, you cannot yet build railway carriages of reinforced concrete, versatile and adaptable as that material is; but it is possible to construct them of treated wood, or to apply to them some form of protective coating which would resist ignition at least for the short but infinitely precious time during which rescue might be effected. In this connection, it is interesting to record that a trial trip was run on January 4th,

on the District Railway, from the Mansion House to South Harrow, of a train composed entirely of the new all-steel cars which will in time supersede the carriages at present in use on the line.

*The Sidney
Street Fire.*

Probably not since the Gordon riots of 1780, when the gaol of Newgate and some other large buildings were destroyed, has a building been fired by being subjected to a state of siege such as that which occurred in Sidney Street, Mile End Road, on January 3rd, during the attempt to capture the supposed murderers of policemen at Houndsditch. Beyond the extraordinary origin of the fire, no noteworthy point arises, except, perhaps, that which may possibly have to be taken into consideration with respect to the settlement of insurance claims, when an extremely complicated problem may arise for solution; the circumstances being happily without exact precedent in this country. This is a matter, however, that does not intimately concern us.

*An Odd Fire In-
cident Recalled.*

The recent death of Lord Wrottesley recalls the fact that his family seat was one of the fine old country mansions of which so many have been lost by fire. Wrottesley Hall, near Wolverhampton, was burnt down on December 16th, 1897, and in it a fine library and many historical deeds and documents perished. The hall was begun by Walter Wrottesley in 1685, and completed in 1698. A curious incident, which excited much comment at the time, was the refusal of the Corporation fire brigade to attend the call, because it was under instructions not to attend fires outside the borough boundaries! Lord Wrottesley decided, owing to his advanced years (he was born in 1824), not to rebuild the Hall, but to live mostly in London; where the fire-service demarcation question was at all events less acute, even towards the *fin de siècle*, than it appears to have been in some of the provinces.

*Chapel as
Fire Station.*

Zeal for the protection from fire of a venerable building does not often lead directly to its disfigurement. An exception to this rule is recorded in the French newspapers. In a paragraph headed "The Reign of the Vandals," it is recalled that the Tonnerre Hôtel Dieu is a most interesting historical monument, having been founded in the thirteenth century by Margaret of Burgundy, wife of Charles of Anjou; and from time to time it has been reverently kept in repair. The original hospital was transformed into a chapel; where the local fire brigade is now allowed to house its appliances. Over the fine old doorway is hung up a signboard on which is painted, in big black letters, the beautiful legend, "*Pompe a incendie!*" Unfortunately it is necessary that the means of prevention from fire should be rendered somewhat obtrusively conspicuous; and many a fine building is disfigured by its arrays of red pails, coils of greasy hose, and hideously lettered indications of what to do and where to go in case of fire. These things have to be endured; but surely their horrors might be mitigated by some attempt at a more artistic display of resources. But probably we cannot show any parallel to that French instance of converting a venerable chapel into a fire-station.

PLANNING AND DESIGNING ELECTRIC CINEMA THEATRES.

BY E. C. MORGAN WILLMOTT, A.R.I.B.A.

What are generally known as electric theatres, though possibly they might be more conveniently called electric cinema theatres, seem likely to become universal, and perhaps permanent. Some particulars in regard to the architecture and planning of buildings suitable for such purposes should therefore be of use and interest.

THE conditons and requirements for electric cinima theatres are such as to make the ordinary rules of theatre planning more or less inapplicable. Economy must be carefully considered, as the prices for the entertainment are so low as to render an extravagant initial outlay out of the question. It must also be borne in mind that the secret of the success of the entertainment is its starting early in the morning and finishing late at night, and that this peculiarity affects the planning. Another item to be borne in mind is the reversal of the usual order of the seats. Most of the earlier plans show the better class seats at the back, and the cheaper seats in the front of the auditorium. It is to be further noted that, in London at least, the Lord Chamberlain's rules as to ordinary theatre planning apply equally in regard to electric theatres. Some of the West End picture entertainments can command comparatively high prices, and there is a consequent increase in the amount available for the decoration and equipment of the building. In these cases the generally accepted principles of theatre planning can be adapted to the designing and planning of the more luxurious types of electric theatres.

The special provisions insisted upon by the Government for the protection and safety of the people attending such entertainments are touched upon in this article as the various points arise.

General Requirements.

The essential accommodation comprises a comparatively small auditorium to accommodate any number ranging from 300 to 500 people. Strictly speaking, one ought not to speak of the body of the hall as an "auditorium," but it is a convenient and familiar term, and perhaps its justification may be assumed by the provision for some form of orchestra; and, further, an entrance vestibule, pay-boxes, and box-office; manager's office, entrance lobbies, and exits; chair store, and lantern-room.

The lantern-room is of the first importance, and must be situated at the back of the auditorium, and usually about 14ft. above the level of the latter, in order that there shall be no interference with the free lighting of the screen. For this room, 12ft. by 15ft. is a good size; and it must be built of concrete or other fireproof material throughout, with efficient roof ventilation. This may be provided by means of an efficient air pump ventilator, or a small sliding roof, or even an ordinary opening skylight. Two cinematograph machines are necessary, one being alternated with the other as either becomes inconveniently hot. The machines, which cost about £25 each, are supported upon solid concrete bases, in order to reduce any possible risk of vibration. Openings are provided in the walls of the lantern-room for the transmission of the rays from the lantern. These openings, which are kept as small as possible, must be properly provided with small self-locking steel roller shutters or blinds, and

Plan of Lantern Rm.

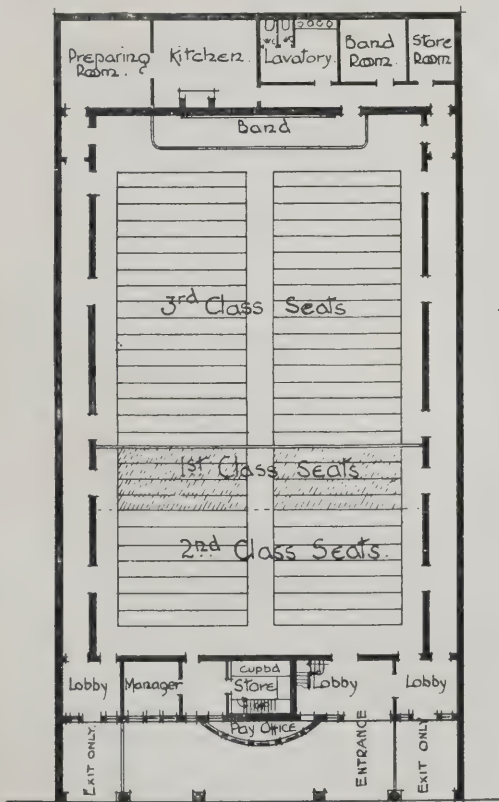

Cross Section

1st Floor Plan (over Entrances etc)

Longitudinal Section.

Plan of Ground Floor.

PLAN OF A FRENCH CINEMA THEATRE.

one of these blinds must be fixed upon the outside of the opening, and another upon the inside.

The Lantern-room.

The entrance to the lantern-room must have a self-closing tightly fitting door, constructed of fireproof material. The openings through the walls for the various pipes and cables must be properly bushed. In some cases the general arrangements of the planning necessitate the lantern house being placed in the auditorium, although this is to be avoided where possible, as effective ventilation of this enclosure is not then so easily arranged for.

It is imperative that no smoke shall under any circumstances be allowed to escape into the auditorium. Hence the ventilation scheme for the lantern-room or lantern-house must not communicate internally with the general body of the building. Attention is directed to a regulation which provides that the enclosure or lantern house, when placed in the auditorium, shall be safeguarded from any chance of the public coming near it by the provision of a substantial barrier erected 2ft. from the walls, and totally around the lantern house.

The Lantern.

Lanterns must be provided with a metal shutter between the source of light and the film gate. The film gate must be of massive construction, and provided with ample heat-radiating surface. The passage from the film must be sufficiently narrow to prevent flame travelling upwards or downwards from the light opening. Cinematograph projectors must be fitted with two metal film-boxes of substantial construction, and not more than fourteen inches in diameter, inside measurement, and to and from these the films are made to travel. The film-boxes are made to close in such a manner, and are fitted with a film-slot so constructed, as to prevent the passage of flame to the interior of the box. Spools are chain or

gear driven, and films are wound upon spools so that the wound film shall not at any time reach or project beyond the edges of the flanges of the spool. Provision must be made in the lantern-room for sufficient space for a number of metal boxes conveniently arranged in shelves or cupboards. These will contain inflammable films.

An Example from South Wales.

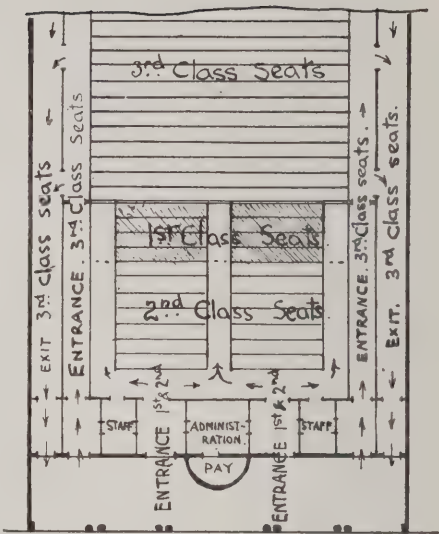

The illustrations shown on page 65 represent the designs of a cinematograph theatre which the author and his partner have erected in South Wales, and as it conforms mostly to the general arrangements advocated throughout this article, a detailed description is likely to be of use. Entrance is obtained from a roomy columned vestibule with entrance lobby and pay office at the back. This, in its turn, gives on to another lobby leading to a passage-way arranged along the whole side of the building.

Seating Accommodation.

The better-class seats, which are arranged at the back, should not be subjected to inconvenience from people constantly going in and out. Consequently, those desiring to have a cheaper seat would enter by the passage arranged on the right-hand side, and no inconvenience would be occasioned to those situated in the better-class seats at the rear, and who would enter their seats through the first lobby situated immediately to the left of the pay-box and store. Ordinary exit for all would be obtained into the exclusively arranged exit passage on the left-hand side; but in case of emergency, exit direct and simple would be obtained from wide doors properly fitted with panic bolts opening on to both side passages. These passages must be wide enough to contain all within the building; and the walls and roof (with their lights) should be built of fireproof material.

The Screen.

The permanent screen must be hung, of course, on the end wall, while space must be provided in front for a sunk and railed orchestra space. The distance between the front rail of this space and the nearest point of the front seats must be at least 4ft., while central and side aisles should be respectively at least 5ft. and 4ft. wide. Behind the screen wall are

PORTION OF PLAN SHOWING ALTERNATIVE ARRANGEMENT OF ENTRANCES.

arranged a kitchen and preparing or serving room. These are suitable adjuncts to a building of this description, because in some of the latest theatres it is usual to provide light refreshments; staff lavatories, a band-room possibly, and a necessary store-room, are also placed at the back of the building.

The Floor.

The floor must be well graded; and preferably the better-class seats are arranged at a slightly higher level than the seats in front. Of course, the higher level will also have a convenient slope towards the screen. This is either hung upon spring rollers or stretched upon a patent steel frame; or, the walls can be whitened, with a neat (and perhaps ornamental) cement architrave of Keene's cement around them. The minimum size would be 15ft. square.

From the main entrance lobby a stairway leads to some boxes arranged at the back; and the general experience of cinema theatre promoters suggests that as large a number as possible of small private boxes should be provided. In the front are a manager's room and a store; and access to the lantern-room is by means of a reinforced concrete or other form of fireproof stairs. A detailed elevation

shows the main entrance loggia with a convenient series of hinged frames for displaying advertisements relative to the shows.

Treatment of Elevations.

An urgent plea is extended for the better treatment of the elevations of these buildings, there being no reason in a permanent building why the design should not pretend to some architectural interest. In the design under notice, while consideration has been devoted to the conventional architectural motif expected by the public in buildings of this sort, it is hoped that no loss of dignity has been suffered, and that the design does not in any way respond to the "wedding-cake" idea that predominates in many of the elevations of the latest of these buildings. This design is carried out in white Carrara ware, and not in plaster, which is a material consideration when orthodox architectural forms are employed.

The wood panelling bay and surrounds are wax-polished walnut, with a green

points of interest in so far as they differ from the first mentioned plan. The lantern house is behind the screen, and therefore quite safely detached from the portion of the building occupied by the general public. The screen is a French patent recently perfected, and allows for the pictures showing through to the audience without any loss of brilliance. The opening in which same revolves is protected by another fireproof screen, which can be conveniently dropped at any moment. Two fireproof doors on either side give access to the various offices in connection with the management. The auditorium is narrow and long, and is arranged as a café, with chairs and tables, adequate service rooms, larders and kitchens being provided. The whole of the front entrance is practically one huge roller shutter with doors in same. Hence, in case of emergency, it is easy at once for the attendant to open up the whole of the auditorium to the street. It will be noticed that the lantern house is

not only shall the general arrangements be controllable from the lantern house, but that there shall also be separate and independent means of control outside, and away from the enclosure.

Where there are special circumstances preventing the use of electric light for the lantern, nothing other than lime-light is approvable, and special regulations are enforced in regard to the use of this illuminant. Natural lighting need be practically nil. In the first design under notice this is obtained from small windows high up, provided with screens worked by the same gearing that will work the fanlights of these windows. Glazed louvre lights are used in the dormers shown.

Electric Theatre for Westminster Bridge Road, S.W.

Owing to the footpath in front of the site being rather narrow, the front of this theatre has had to be recessed, in order to allow a space for the public to congregate without blocking the footpath. The

glazed plinth. With regard to the architectural treatment of the interior, the necessity for strict economy debars any great outlay in the way of decoration.

Fireproofing Imperative.

Construction throughout must be of fireproof character, the roof being preferably of iron, with a segmental roof under for plaster upon metal lathing. The walls may be of brick or concrete; the floor is of concrete and wood-block. An alternative arrangement for the entrances is illustrated on page 66, a central entrance leading to the better-class seats, with exclusive side entrances leading through side passages to the cheaper seats. This arrangement leaves the large side corridors perfectly free as emergency exits, while inconvenience to occupants of the better class seats is quite done away with.

A French Example.

An illustration on p. 66 shows a plan of a French cinema theatre, which presents

not (as is usual) interposed between the public and the street, but is arranged quite safely away from the audience, and with an impassable fireproof wall in between it and the public. A good idea is the provision of a bicycle store at the entrance, under the charge of the attendant in the pay office.

Arrangement of Seats.

Some other and more recent plans reverse the usual arrangements, and place the screen at the entrance end of the hall, and the lantern at the back end. This gives quite obvious advantages.

Often a flat roof is arranged with sliding light. Sometimes plans are complicated by the problem of shops in front with offices over. Balconies are sometimes arranged, especially at the back.

Fire Appliances and Lighting.

Proper fire appliances must be provided. The lighting of the auditorium is preferably electric light, and it is essential that

proposed exterior is simply treated in red sand-faced stocks and Bath stone, the roof being of green slates. Internally the foyer has a groined plaster vaulted ceiling, the walls being decorated with moulded plaster panels. A special feature has been made of the interior of the picture theatre, which has been designed in pure Adam style, the walls to be finished white and the ceiling delicately enriched. The mechanical effects and electrical musical instruments to be installed will be very complete. The architects are Messrs. Fair and Myer, A.R.I.B.A., of London and Manchester.

Harper Electric Piano Co.'s Building, Holloway Road, N.

This building has been designed to hold 1,000 spectators, and in addition to the electric theatre there will be a small public hall, a café and skating rink all adjoining. In front of the electric theatre there will be a paved forecourt with a terra-

TUITION
BY CORRESPONDENCE.

It is beyond question that many of the most successful educational institutions of to-day are those which are conducted on commercial lines and have a business basis. "Private adventures" of the kind were at first looked upon with some degree of distrust in this most conservative of countries, where education in all its branches was long regarded as being the monopoly of ancient foundations, of State-aided schools, and other institutions whose existence largely depended on benevolent contributions or "grants in aid."

By degrees, however, the public have become familiarised with the idea that educational institutions can be run on business lines, and it has even been discovered that, in order to justify and maintain its existence, a self-supporting institution of this character is bound to acquire and maintain a well-marked reputation for efficiency.

Such institutions may afford an excellent means, not only of supplementing the notoriously inadequate curriculum of the ordinary schools, but also of meeting specifically a well-ascertained need for which, apparently, no other provision is made: they fill a gap.

Take, for example, the case of the young architect whose principal has for some reason or other—perhaps unavoidable—fallen short of his duty towards his artiled pupil. What is the young fellow to do, supposing

cotta fountain, ornamental piers, and decorative wrought-iron palisading. The floor and steps of the foyer are all marble, the walls being enriched with plaster decoration. The main floor of the theatre has a fall of one in ten, the walls and ceiling being rather elaborately treated with plaster enrichments. The roof is constructed with steel principals, the outside being covered with slates. The whole of the music will be produced mechanically and controlled from the operator's room, the instruments used being the orchestra and electric piano for orchestral music, and a powerful gramophone for "singing pictures." The exterior of the building will be finished in white egg-shell glazed vitreous ware. The architects are Messrs. Fair and Myer, A.R.I.B.A., of London and Manchester.

A Bristol Picture Exhibition.

A picture theatre which has been erected at Zetland Road, Bristol, under the direction of Mr. W. H. Watkins, A.R.I.B.A., is capable of accommodating 1,400 persons, 1,000 of whom can be seated on the ground floor and the remainder in the balcony. The external elevation is of rubbed bricks in dressing of Monk's Park freestone on the ground floor, the upper portion of the frontage being treated with stucco. The façade consists of a central gable and two side turrets, which are covered with green slates. The theatre is entered through four pairs of double glazed and panelled doors, the circle, with separate entrances, being reached by means of two spacious white marble staircases. The circle is supported by steel girders and cantilevers, the main girder weighing nine tons. The contractors were Messrs. Wilkins and Sons, of Bishop Street, Bristol.

Electric Theatre, Sydenham.

The illustrations on pages 69 and 70 show the new electric theatre which has been erected in Sydenham Road, Sydenham, London, S.E., from designs by Messrs. Parnacotts, of 93, York Road, Westminster Bridge. In this the architects have endeavoured to express the character of a small entertainment hall, and to further

the idea they have selected a Palladian motif for the entrance portico. The interior has been decorated in French grey and cream with dark dado, so that the natural dampness of the new work should not be conspicuous. Only a small slope in the floor could be attained, owing to the levels; this, however, could easily be removed, providing a level floor, when the building could be used for other purposes if found necessary. The hall accommodates about 450 persons, and is particularly easy to clear. It was opened in October last.

that, as is the case in a multitude of instances, he is unable to avail himself of the facilities afforded by the architectural schools? He is in no small danger of becoming derelict.

But, even though he may, by considerations of time, distance, and lack of funds, be shut out from the officially recognised technical or professional schools, his case is by no means hopeless. The International Correspondence College, for example, comes to his rescue. It will, for a small fee, provide him with a skilfully arranged course of instruction, which he can assimilate in his own home.

The set of text-books, or, as they are modestly styled, "instruction papers, with examination questions," pertaining to the I.C.S. course on Architecture having come into our hands, we must confess to considerable surprise at the pains taken in the production. The text-books are quite beautifully produced, being printed on art paper, and containing a very large number of first-class photo-process engravings, besides many highly effective coloured plates. Four of the books, which each contain from 150 to 170 pages, deal very clearly and concisely with the history of architecture; the subject being presented with remarkable point and precision. The origin of architecture having been tersely and quite usefully described, the characteristics of Egyptian architecture are enumerated and illustrated. The headings under the various sections may be quoted as showing the methodical plan of the book. They are: Influences (geographical, geological, climatic, religious, political, and historical); characteristics; examples; analytical study (plans, walls, roofs, columns, openings, mouldings, ornament, etc., forming subsidiary headings). The examples from Greece are, of course, the Parthenon, the Erechtheum, the Temples of Artemis and of Nike Apteros, the Propylæa, the Choric Monument of Lysicrates, the Tower of the Winds, and the tombs and theatres; those from Roman architecture are the fora, temples, basilicas, baths, theatres and amphitheatres, triumphal arches, columns of victory, tombs, aqueducts and bridges, and palaces. At the end of each part there is a list of examination questions, enabling the student to test the extent to which he has mastered the facts that have been set before him in such orderly, definite, and intelligible form that they cannot possibly be misapprehended. It is a common fault of text-books that the student is compelled to "dig out" his facts, and, as often as not, he is an unskilled excavator, and can never feel certain that he has got them all, and got them right. Here, however, the laborious and not altogether profitable operation is carefully performed on the student's behalf; the essential facts, completely ascertained and shorn of all superfluity, are made visible and tangible, so that the student is spared much waste of effort, and much harassing uncertainty.

Masonry, beams and plate girders, stair building, etc., are dealt with in separate treatises in the same direct and methodical style, not a word being wasted, and all the essential points being brought into high relief with admirable skill. The mastery of such books, supplemented by the careful revision of the student's papers by expert members of the I.C.S. staff, should prove invaluable not only to the youthful student, but to the practising architect who feels that his knowledge on such points is growing somewhat rusty.

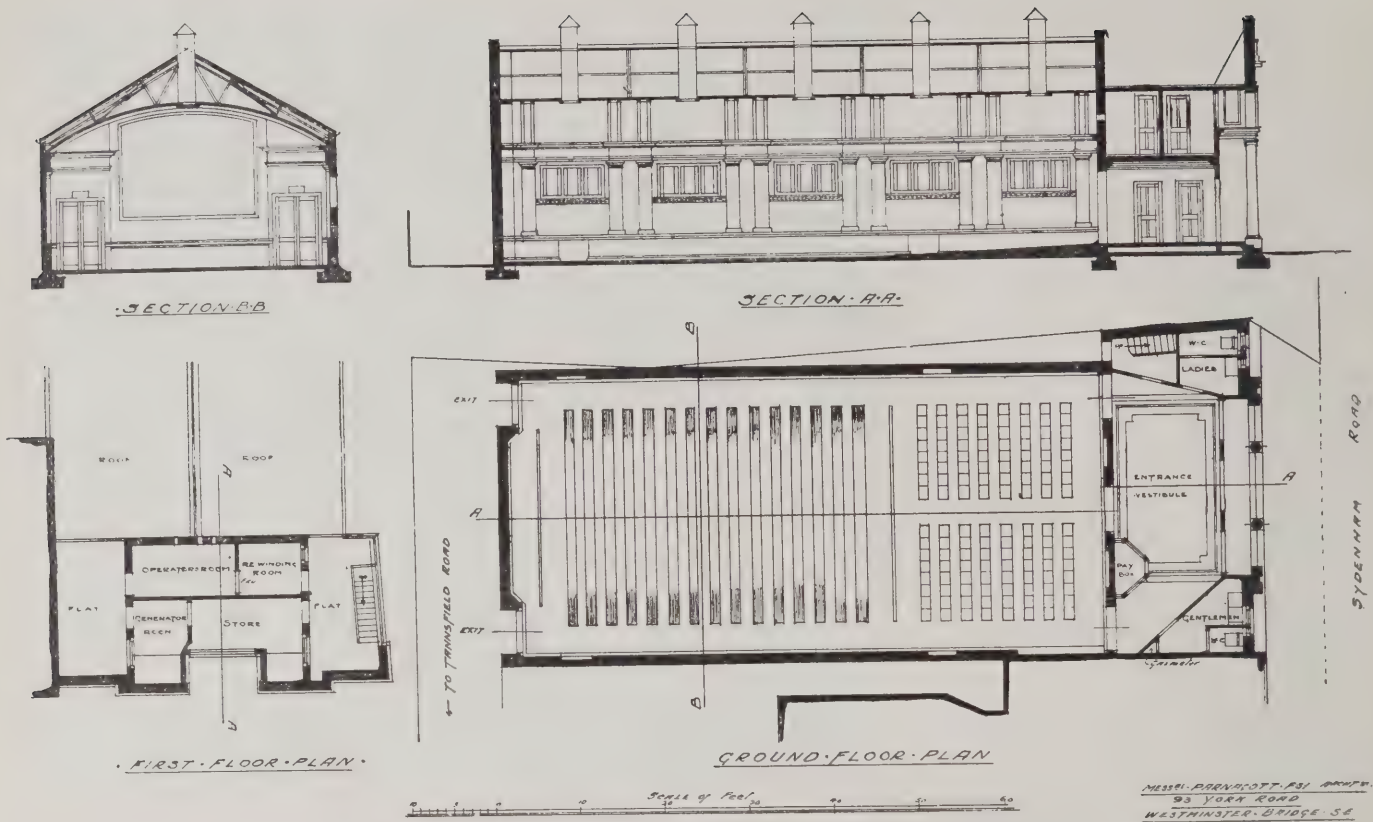

But it may be asked, Why cannot the intelligent student do all this for himself?

ELECTRIC CINEMA THEATRE, SYDENHAM, LONDON, SE. PARNACOTTS, ARCHITECTS.

In the first place, notwithstanding his intelligence, he would need guidance as to the choice of text-books; and when he had got them he would need still more careful guidance in the choice of what to remember and what to forget of their often very confusing contents. Then, by studying "on his own," he would lack most of the stimulus which is recognised as a vitalising and an essential element in education. A correspondence college like the I.C.S. supplies stimulus in several forms: (1) The student feels in sympathy, if not in competition, with a number of others who are doing the same sort of thing; (2) he feels that his progress is being

watched; and (3) sordidly, but sensibly enough, he feels that he owes it to himself to get back the value of his money. Also, he feels bound (as he would not feel if he were merely his own taskmaster) to apply himself at a regular hour to a given task, and so, instead of dropping the subject at an early stage, as a solitary and unattached student is deadly apt to do, he perseveres until he gets through. This does not exhaust the advantages of the I.C.S. system, which embraces many interesting forms of educational and social activity. The subjects, indeed, make a long list, in which the architect who may perhaps disdain to take lessons in his own

ELECTRIC CINEMA THEATRE, SYDENHAM.

profession, may nevertheless feel less fastidious with respect to kindred or subsidiary subjects, like electric lighting and wiring, surveying, and quantity surveying; or he may, on glancing down the list, be struck with the idea that he would be none the worse for a little coaching in commercial training or book keeping, or building construction, or concrete engineering, or that he would like to add to his stock of knowledge one or more of the languages in which, as in the many technological subjects in the list, the I.C.S. is in a position to offer efficient coaching. The address of the International Correspondence Schools, Ltd., is International Buildings, Kingsway, London, W.C.

An ingeniously elaborated system is in operation for keeping accurate record of each scholar's progress, and every paper received is carefully examined by an expert, its defects (if any) being fully corrected and explained, and general comment and advice attached to the return letter. Important posts which are from time to time available are filled at the discretion of the examiners, who keep their eye on the work of likely candidates, and are, we hear, most careful not to put the round man in the square hole. The I.C.S., therefore, is a kind of clearing-house for talent, and besides its purely educational functions, fulfils the purposes of an efficient employment bureau.

THE ROOF OF NEW STREET STATION, BIRMINGHAM.

At last week's meeting of the Institution of Civil Engineers, a paper was read on "The Strengthening of the Roof of New Street Station, Birmingham," by Mr. Wm. Dawson, M.I.C.E. The roof of this station, erected in 1852-3, is the prototype of the one formerly existing over Charing Cross Station, and is of the bowstring girder type, of 212 ft. span. Having regard to the results of the Board of Trade inquiry into the failure of one of the tie-rods of Charing Cross roof, it was deemed advisable, as a precautionary measure, to fix auxiliary tie-bars to the principals, especially as they were of somewhat lighter construction than accorded with modern practice. The tensile stress in the main tie-rod due to dead load, painters' scaffolding, and a horizontal wind-pressure of 40 lbs. per sq. ft., was 6.93 tons per sq. in., whilst the corresponding stress in the arched rib was 3.07 tons per sq. in., and it was therefore considered that the former alone need be strengthened. Auxiliary tie-bars were accordingly fixed to each principal, by means of scaffolding suspended directly from the arched ribs of the principals by wire ropes, so as to avoid all interference with the traffic on the lines or platforms below. This scaffolding was moved forward from principal to principal as the work proceeded, without being lowered to the platforms. In order to avoid placing additional stress on the existing tie-rods owing to the weight of the scaffolding, temporary steel hawsers were secured to the feet of the principals and stressed to an amount which counteracted the effect on the tie-rod of the weight of the scaffolding. The auxiliary tie-bars were formed of

two 6 in. by $\frac{3}{4}$ in. steel bars placed on edge, and in order that a certain definite amount of relief might be given to the existing tie-rods, an initial stress was put in the auxiliary tie-bars, and accurately measured by means of calibrated springs. While this work was in progress the principal was lifted and suspended clear of its bearings by means of a derrick, so that the full tensile stress might be developed in the tie-bars, and not be partly absorbed in tending to draw over the head of the column on which the principal rested. The new tie-bars were secured to the existing principals by means of $2\frac{3}{4}$ in. diameter pins, which passed through the shoe of the roof principals.

At last week's meeting of the Institution Mr. Dawson also read a paper on

*The Reconstruction of Arpley Bridge,
Warrington.*

The London and North-Western Railway Co.'s line over which the heavy traffic passes between Liverpool, Garston, and Manchester and Yorkshire districts, crosses the River Mersey at Warrington by a girder bridge of 180 ft. span, erected in 1853 from designs by the late Mr. John Lister. The bridge formerly consisted of three main girders with a suspended timber floor to which the permanent way was directly attached, and as the working of

the goods-traffic necessitated the use of a heavier class of engine than had hitherto been employed, it became necessary to strengthen the bridge, and at the same time to widen it, so as to provide the clearance between the girders required by the minimum construction gauge. Various schemes for this purpose were considered, bearing in mind the necessity of maintaining the railway traffic across the bridge, and avoiding interference with navigation below. It was ultimately decided to substitute new girders for the existing face girders, and, by means of overhead girders connected with the top booms of the new girders, to transfer to the latter a portion of the load that would otherwise be carried by the centre girder, which was already overloaded. A new steel floor was also to be provided.

The method of carrying out the work at site is perhaps the most interesting feature. This was accomplished by first closing one of the lines over the bridge, and erecting the new face girder on the existing floor, all traffic being meanwhile worked over the other line. After the first girder had been completed, the portion of the floor on which it was built was cut away, and the old face girder was removed in the following manner:—One end was placed upon a trolley, and barges, on which a suitable stage had been built,

were floated underneath the other end at low water. The rising tide lifted this end off its bearings, and it was then pulled on to the opposite abutment by a locomotive running on the ordinary line of rails. The new face girder was next placed in its final position, and the first half of the new steel floor was fixed, after which the permanent way was restored and all traffic was diverted over the strengthened portion of the bridge. The other half of the bridge was dealt with similarly. When this work had been completed, steps were taken to relieve the old centre girder permanently of such an amount of load as would ensure that under no conditions of traffic would the stress in the bottom flange exceed 5 tons per square inch.

HOUSE AT WESTCLIFF.

A feature of the plan of this house (reproduced on the next page) is the entrance hall, from which the various rooms open. The house is built for a doctor, and the entrance to the surgery is arranged on the west side, with waiting-room adjacent. The plan upstairs works out economically, there being no passages, as the bedrooms are entered from the landing. For the exterior, red bricks have been used for facings, with rubbers for dressings. The builders were Messrs. Cross and Sons, of Hutton, Essex.

HOUSE AT WESTCLIFF-ON-SEA. WALTER J. TAPPER, ARCHITECT.

NEWS ITEMS.

Alterations to Rochdale Town Hall.

The Rochdale Town Council have agreed to spend £3,000 on internal alterations to the Town Hall.

Masonic Temple, Aberdeen.

In Crown Street, Aberdeen, a new Masonic temple has just been completed from designs by Mr. Harbourne MacLennan, architect, of Aberdeen. It has cost £10,000.

New General Post Office, Sheffield.

The leaded glass for the whole of the principal front windows of this building (described and illustrated in our Edition de Luxe) was supplied by Messrs. Walter J. Pearce, Ltd., of 41, Gartside Street, and Hardman Street, Manchester.

A Big Claim for Extras.

The Housing Committee of the Swansea Corporation has under consideration a big claim for extras under one of its housing contracts. It is understood that while the contract is for £19,760, extras are claimed by the contractors which already bring the total up to £24,400.

Rebuilding of Wimbledon Hospital.

The Committee of Management of the Wimbledon Hospital has decided to rebuild the institution. The first part of the new building to be erected will consist of the administrative block and two wings, and in one of the latter will be situated the "King Edward the VII. Ward" as a memorial to the late King. Another memorial ward will be the "Collyns Ward," in commemoration of Dr. Poole-

Collyns, the first medical officer of the hospital, who died a few years ago. In order to complete the new hospital free of debt an appeal is being made for £3,000.

New Reservoir for Birkenhead.

The contract for a new reservoir to be constructed for the Corporation of Birkenhead has been allotted to Messrs. Robert M'Alpine and Sons, Glasgow. The reservoir is to be situated at Corwen in North Wales, and will have a masonry dam. The cost is estimated at £180,000.

Cement-making Plants.

The manufacture of complete cement-making plants, with rotary kilns and other modern apparatus, is now being taken up by Messrs. Edgar Allen and Co. (Ltd.), of Tinsley, who manufacture the plant, erect it, and work it with their own staff before completing delivery. In addition, they advise as to the suitability of materials for cement making.

New Books.

In the list of books to be published by Messrs. Macmillan between now and Easter are new editions of the firm's guides to Italy and Sicily (revised by Dr. Thomas Ashby, Director of the British School at Rome), Palestine and Syria, and Greece, and an historical essay on "Hellenistic Greece," by Professor Ferguson, of Harvard University.

New Art Purchases.

The Corporation of Liverpool has acquired for its permanent collection the large statuette of "An Athlete struggling with a Python," by the late Lord Leighton, P.R.A., published by Messrs. Ernest Brown and Phillips, of the Leicester Gal-

leries, London, and recently lent by them to the autumn exhibition at the Walker Art Gallery. A painting in tempera of "The Meeting of the Virgin and St. Anne," by Mr. R. Anning Bell, R.W.S., has been purchased by the Corporation of Manchester from the exhibition of this artist's works held last month at the Leicester Galleries.

Seward v. the Cardiff Corporation.

The hearing of the action in which Mr. Edwin Seward, F.R.I.B.A., seeks to recover £10,000 from the Cardiff Corporation for services rendered, damages, etc., with respect to the proposed Welsh National Museum and Library at Cardiff, was resumed last week before the Official Referee, Mr. Muir Mackenzie. Counsel on both sides having been heard, the Official Referee reserved his judgment.

Liverpool Cathedral.

The Liverpool Architectural Society have resolved to invite Mr. Gilbert Scott, architect of Liverpool Cathedral, to read a paper before their members in detailed explanation of his variation of the design of the building. It is considered to be of much interest to know (1) how Mr. Scott intends to utilise the existing foundations for the twin towers originally proposed; and (2) how he will treat the suggested central oblong space beneath the single tower.

Sir William Richmond on Post-Impressionism.

In the first of four lectures on Painting which he is delivering at the Royal Academy, Sir William Richmond said he saw no likelihood of another Renaissance in Post-Impressionism—from which might God preserve them—but he saw a union in the future between Pre-Raphaelism and Impressionism. This was coming nearer—he meant among serious artists, not fad-mongers. With it would come a more literary and intellectual art, which would not provide less but more pleasure, which would have more to say, and would possibly say it better. He had no fear of a repetition of the follies of Post-Impressionism by English artists. English people must, indeed, change and obliterate their finer characteristics before such an incapable reaction—except for notoriety—could find serious followers.

A 'Structure' Under the Building Act.

For erecting an ornamental canopy to their premises in New Oxford Street, without the written consent of the London County Council, Messrs. A. and F. Pears, Ltd., were recently summoned at Bow Street, when an order was made for the removal of the structure, and a penalty of 20s. imposed on each summons, with ten guineas costs. Messrs. Pears claimed that the structure, which was 18ft. long, 2ft. deep, and projected 4ft. 6ins., did not come within the Building Act. The magistrate (Mr. Curtis Bennett) consented to state a case for the High Court. Under the London Building Act of 1894 the Council have power to control and regulate any fixed erection projecting beyond the building line in the streets under their control. They are now seeking similar powers in respect to such projections which are not fixed but movable, such as pulleys, cranes, leading, flaps, awnings, screens, blinds, lamps, daylight reflectors, clocks, and advertisement devices.

DOMESTIC ARCHITECTURE OF THE EIGHTEENTH CENTURY.

BY J. ALFRED GOTCH, F.S.A., F.R.I.B.A.

In his eighth and concluding lecture at University College, London, Mr. Gotch dealt with the general characteristics, the faults and the merits, of the architecture of the eighteenth century, which was pre-eminently the age of the "distinguished amateur," and the age of "taste," true and false.

THE eighteenth century saw the final development of that great movement in architecture which, in England, began in the early years of the sixteenth. As we have already seen, it was in the reign of Henry VIII. that the influence of Italy first made itself felt in English architecture; and that influence gradually increased during the reigns of his successors, until, under the two Charleses and in the hands of Inigo Jones and Sir Christopher Wren, the Italian manner triumphed over the last remains of our native traditional methods of design. It was largely a victory of the text-book over the workshop.

Text-book v. Workshop.

Gradually the architect with his text-book took the place in design which was formerly occupied by the workman with his traditions. This change had its advantages and its disadvantages. One of the disadvantages had become very marked by the beginning of the eighteenth century, and that was the divorce of architectural design, not only from architectural construction, but to a large extent from practical considerations of convenience.

So much had the taste for classic architecture grown, that to the eighteenth century architecture was little more than the Five Orders. Gothic architecture was wholly misunderstood; it was despised, and regarded as barbarous. The "Gothic Order," as they called it, was described by a writer of the time as "The Folly and very Ape of Architecture." Such an attitude of mind is hardly intelligible to us who recognise Gothic architecture as perhaps the most logical and daring form of construction that man has yet employed. It is hardly less difficult to understand how men of that time can have failed to be impressed with the majestic solemnity of a great Gothic cathedral; and yet they did fail—even such cultivated men as Evelyn and Addison.

John Evelyn's Views of Architecture.

The phrase about the "very Ape of Architecture" occurs in a treatise by a lively Frenchman, M. Freart, and, considering the subject, a very entertaining treatise it is. But Evelyn's views were those of a sagacious unimpassioned Englishman, and are worth quoting at some length as illustrating the standpoint from which the late seventeenth and early eighteenth centuries looked at the subject. In treating of architecture, he says:—"It is the ancient Greek and Roman architecture only which is here intended, as most entirely answering all those perfections required in a faultless and accomplished building; such as for so many ages were so renowned and reputed, by the universal suffrages of the civilised world, and would doubtless have still subsisted, had not the Goths, Vandals, and other barbarous nations subverted and demolished them, introducing in their stead a certain fantastical and licentious manner of building, which we have since called 'modern' (or Gothic rather), congestions of heavy, dark, melancholy and monkish piles, without any just propor-

tion, use or beauty, compared with the truly ancient. So that when we meet with the greatest industry and expensive carving, full of fret and lamentable imagery; sparing neither of pains nor cost; a judicious spectator is rather distracted and quite confounded than touched with that admiration which results from the true and just symmetric, regular proportion, union and disposition; the great and noble manner, which those august and glorious fabrics of the ancients still produce.

"It was after the irruption and swarms of those truculent people from the north, when instead of those Beautiful Orders they set up those slender and misqu Shore pillars, or rather bundles of staves and other incongruous props, to support incumbent weights, and pondrous arched roofs, without entablature; and though not without great industry nor altogether naked of gaudy sculpture, trite and busy carvings; 'tis such as rather gluts the eye, than gratifies and pleases it with any reasonable satisfaction.

"For proof of this (without travelling far abroad), I dare report myself to any man of judgment, and that has the least taste of order and magnificence; if after he has looked awhile upon King Henry the VIth's Chapel at Westminster; gazed on its sharp angles, jetties, narrow lights, lame statues, lace, and other cut-work and crinkle-crinkle; and shall then turn his eyes on the Banqueting House built at Whitehall by Inigo Jones after the ancient manner; or on what his Majesty's present surveyor, Sir Christopher Wren, has lately advanced at St. Paul's, and compare them judiciously without partiality and prejudice, and then pronounce which of the two manners strikes the understanding as well as the eye, with the more majesty and solemn greatness. In this sort have they, and their followers ever since filled, not all Europe alone, but Asia and Africa besides, with mountains of stone, vast and gigantic buildings indeed; but not worthy the name of Architecture. Witness what are yet standing at Westminster, Canterbury, Salisbury, Peterboro', Ely, Wells, Beverley, Lincoln, Gloucester, York, Durham, and most cathedrals and minsters."

Addison's Heresy.

Thus far Evelyn. That Addison had no clearer insight into the nature of architecture will be seen from the 415th "Spectator," where he says:—"Let any one reflect on the disposition of mind he finds in himself, at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing; and at the same time, consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other; which can arise from nothing else but the greatness of the manner in the one, and the meanness in the other."

The Art of Building Finely.

The fact is that architecture was misunderstood by the writers and designers of the period. In their view it dealt almost exclusively with pictorial effect.

Planning to them meant first and foremost the arrangement of a building in regard to its appearance, not in regard to the functions it had to fulfil. Broadly speaking, a well-designed building is as much a product of evolution as natural scenery or the forms of plants and animals. Natural scenery is almost entirely governed by the geological formation of the district. Plants and animals have assumed their various forms chiefly as the result of the necessities of their growth, which again are dictated by the functions they have to fulfil. And so it is—or ought to be—with a building. Architecture is not only the art of building finely, it is the art of building finely in order to comply with certain specific conditions.

The notion of architecture does not seem to have occurred to the eighteenth century, and so the chief aim of its architects (at any rate in the larger houses) was to dazzle and impress the spectator, rather than to please and satisfy the indweller. Lord Chesterfield told General Wade, for whom the Earl of Burlington had designed an inconvenient though handsome house in Burlington Street, "if he could not live in it to his ease, he had better take a house over against it and look at it"; a piece of advice by which many a nobleman might have profited.

A Matter of Rule and Compass.

The continued cultivation of the Italian manner for nearly two centuries, the increasing importance attached to the rules of proportion which governed so many of the buildings of Italy, both ancient and modern, resulted in making architectural design largely a matter of rule and compass. Macaulay has observed that during the latter part of the seventeenth century and the early part of the eighteenth the heroic couplet was so much in vogue and was brought to such perfection by constant use, that every poetaster could employ it with as much facility as Pope himself. It was much the same in architecture. The rules were so well known that it required no particular aptitude to apply them. Skilful planning with a view to meet definite needs was not expected, and the result was a tendency towards a monotony of treatment in strong contrast with the vivacious individualism of a century earlier. Just as in poetry it is not the polished form of the verses that marks the true poet, but the ideas contained in them; so in architecture it is not the correct marshalling of columns, and the "nice conduct" of entablatures that must be our criterion, but the manner in which the whole building satisfies and expresses the wants which it is expected to supply. Judged by this standard, how many of the designs in Campbell's "Vitruvius Britannicus" would come within the category of true architecture? And yet those volumes contain nearly all the larger houses built in the first half of the eighteenth century.

Eighteenth Century Art.

It must be borne in mind that in matters of art, the eighteenth century was very artificial. An essayist of the time, writing in 1739 describes how he went to bid farewell to a friend who was about to embark for the war in Flanders, and who, in view of eventualities, had caused his portrait to be painted. The writer extols the painting as a masterpiece of design and execution. The warrior himself was represented in the guise of Hector, his wife as Andromache, and his little boy in the arms of an

aunt as the infant Astyanax carried by his nurse. "I could wish," he says, "it was to become a general fashion to have all pictures of the same kind executed in some such manner."

The Theatrical Style, and Tobiah Jenkyn, Esq.

This theatrical treatment in painting had its counterpart in architecture. Campbell introduces one of the designs in his "Vitruvius Britannicus" thus: "This design of my invention in the Theatrical Style is most humbly dedicated to Tobiah Jenkyn, Esq." The Theatrical Style, he tells us, "admits of more gaiety than is proper either for the Temple or Palatial Style." The large houses of the period were all more or less theatrical; that is, they were designed with a view to impress the beholder, rather than to provide a comfortable home; just as in somewhat later years the laying-out of gardens and grounds was contrived with the aim of producing the effects found in the pictures of Claude Lorraine and other landscape painters, down even to the introduction of artificial ruins. Shenstone says, "I think the landscape painter is the gardener's best designer."

In describing the plan of his house in the theatrical style dedicated to Tobiah Jenkyn, Esq., Campbell dwells not on the convenience of arrangement, not on the cheerful aspect of the rooms or any special contrivance for the comfort of the inhabitants, or whatever goes to make a house a home, but on the proportions of his principal apartments. "Here," says he, "is the double and single cube, the Hall being 27 by 54. Here is 18 by 27, which is the *sesqui altera*, and 21 by 27, the *sesqui tertia*, and you pass gradually from the larger to the lesser"; all of which may have satisfied the wants and aspirations of Tobiah Jenkyn, Esq., but would not compensate his descendants for the absence of those arrangements which make daily life tolerable.

Eighteenth Century Planning.

The needs of daily life went but a little way to model the great houses of that time. Architectural grouping, in order to impress the beholder, often led to dividing the mansion into separate blocks, one for the family rooms and state apartments, one for the kitchens and servants, and one for the stables. The kitchen, therefore, would be hundreds of feet off the dining-room, a drawback against which Sir Henry Wootton warned his readers; "or else," says he, "besides other inconveniences, perhaps some of the Dishes may straggle by the way." Sometimes the servants' quarters were located in two detached blocks hundreds of feet apart, balancing the composition of which the family rooms formed the centre, and joined to the latter by open colonnades. How the service of the house could be carried on with the two halves of the staff separated from each other by a five or ten minutes' walk is not very clear; but of course the mansions were not built for the servants, but a little for the family itself, more for its grand guests, and most for the casual spectator who was to admire the lordly pile as he passed by.

The servants, indeed, had to put up with what accommodation they could get. Their hall might be a vaulted underground room lighted only by areas, as at Buckland in Berkshire, and their bedroom windows might look out on to the back of the parapet. The butler might have to sleep in a room without any outside wall, and no direct light and air. But in those

days servants could hardly expect to be exempt from suffering for architectural effect, when their employers were content to suffer as well. And they *must* have suffered; for, wholly apart from considerations of bad service, the family were often located in a low basement with all the weight of the state apartments over their heads. Their rooms were not contrived to catch the morning sun, or to get a splendid view, or, indeed, for any particular purpose relating especially to them; but they were arranged to fill up the space beneath the great rooms of State, and if they were comfortable, it was more by good luck than by good management.

Amateur Architects.

The architects of those days were, in fact, many of them, amateurs, and the kind of architecture in demand was such as amateurs could supply. Pre-eminent among them—at any rate in social position—was the Earl of Burlington; and when we consider this fact for a moment, we need hardly be surprised at the amount of unreal and theatrical design that was produced. Who could expect an Earl to concern himself with the niceties of household planning? No wonder that General Wade received that advice from Lord Chesterfield to take a house over against his new mansion and look at it. Yet all through the century Lord Burlington was looked up to as the greatest patron of art that England has ever produced, and especially of architecture. Horace Walpole extols his taste and his ability. He "had

every quality of a genius and artist, except envy"; yet withal he cannot disguise from himself that Ripley, who was an architect by occupation, "in the mechanic part, and in the disposition of apartments and conveniences, was superior to the Earl himself."

Pope, of whom Lord Burlington was a patron, satirises Ripley more than once; but then Ripley did not belong to Pope's faction. Pope himself, in one of his epistles, points out a way in architecture which no one seems to have followed. Walpole has some remarks on the villa at Chiswick which are worth repeating. It is "a model of taste," he says, "though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many corresponding doors in spaces so contracted; chimnies between windows, and, which is worse, windows between chimnies; and vestibules, however beautiful, yet too little secured from the damps of this climate. The ground apartment is rather a diminutive catacomb, than a library in a Northern latitude." Then he adds a few sentences which throw some light on one of the motives that actuated the eighteenth century. "The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and the new house, are more worth seeing than many fragments of ancient grandeur, which our travellers visit under all the dangers attendant on long voyages." The theatrical treatment is again perceptible

CANONS ASHBY: GARDEN DOOR.

MILTON: THE GARDEN FRONT.

in making a new English villa rival "the classic scenery" and the "fragments of ancient grandeur" which were to be found abroad.

When Architecture "Resumed Her Rights"!

It is from the opinions of men who lived in the eighteenth century that we can best gather the motives that underlay their actions, and therefore a further quotation from Walpole may be excused: "It was in this reign" (of George II.) he says, "that architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique, recalled her to true principles and correct taste; she found men of genius to execute her rules, and patrons to countenance their labours. She found more, and what Rome could not boast, men of the first rank who contributed to embellish their country by buildings of their own design in the purest style of antique composition." We have seen one of these men of the first rank, Lord Burlington, and what he did. Another was Lord Pembroke, and he is worth singling out because, according to Walpole, "no man had a purer taste in building than Earl Henry, of which he gave a few specimens, besides his work at Wilton." Now his work at Wilton is not easy to assign, for the house is attributed largely to Inigo Jones, and the "theatric bridge," as Walpole calls it, to Morris. But at any rate this bridge is less objectionable than the other "theatric" work of the time, inasmuch as it imposes no special inconvenience on anyone; yet whether a bridge of this kind is in harmony with English scenery is a debatable question.

The extravagances of the second quarter of the eighteenth century sprang from an indulgence in "taste" apart from consideration of propriety, and it was Lord Burlington who led to them, partly by his own work and partly by his publication of the designs of Inigo Jones's and Palladio's antiquities of Rome. But it only wants a comparison of Inigo Jones's work with that of Burlington and his successors, or a comparison of Wren's with theirs, to see how these two men were really architects, while the others were amateurs occupied with what they did not thoroughly understand, and into the practical details of which they did not care to enter.

The Eighteenth Century Palace.

But while we cannot but feel that in the true essentials of architecture they were sadly lacking, there is no doubt that they

produced striking results. One of these fine palaces when it was surrounded by its original gardens, must have been remarkably imposing. Take Blenheim, for instance. If we regard it as a home, we must be disappointed, but as the dwelling of a great noble, living in state and surrounded with all its attendant ceremony, receiving other great nobles with their retinues and housing them in great magnificence—in these respects it has much to claim our commendation. There is much excuse for it in the fact that it was a gift from the nation to its greatest son; it had to be splendid at all costs; yet it

did not meet universal appreciation even in those days, as witness the lines of Swift:—

"Tis very fine,
But where d'ye sleep or where d'ye dine?
I find, by all you have been telling,
That 'tis a house, but not a dwelling."

Nevertheless, with all their drawbacks, these palaces were stately. The plans look gorgeous on paper, and so do the sections showing the internal decoration. The effect of the places themselves is, perhaps, rather depressing on the ordinary person, the grandeur is a little too obvious; there is no such feeling of homeliness as in the many-panelled rooms of the early seventeenth century; but when all is said, the fact remains that the architects of the later time had a very definite aim in what they did, and they achieved it.

Eighteenth Century Homes.

When we leave the mansions of the nobility and come down to the houses of the squire or the well-to-do merchant, we find ourselves in a much pleasanter atmosphere. They have a quiet dignity about them which is decidedly restful and attractive, especially those of the first quarter of the century. In later times, the portico idea became too prevalent, which consisted in affixing to the front of an otherwise plain house some variation of the columned front of an ancient temple. But the earlier houses, with wide corniced eaves, simple horizontal strings dividing the rows of sash windows, and combining with the quoins

DETAIL OF STAIRCASE WALL, COTTESBROOKE PARK.

that emphasise the angles—these will no doubt long continue to form the model for houses of similar use and capacity. It is just a question whether this is quite the type that suits the present age; for our wants seem to grow always more complex, and to require a more elastic style than one depending for its effect on strict symmetry and unbroken horizontal lines.

[Examples shown on the screen included, Foremark (Hiorns); Moot House, Down-ton, 1720; Honnington Hall, Warwickshire; Ball's Park, Newbury; Canon's Ashby.]

Dignified Interiors.

If we cannot take a wholly sympathetic view of the purely architectural work of the eighteenth century—at any rate in its more notable examples, which, like Somerset House, seem more suitable for public buildings—neither can we forget that we are indebted to it for much that is suggestive in matters of detail; in the joiner's work, in the plasterer's work, in the ironwork and the leadwork.

The formal and precise treatment of the plan often led either consciously or unconsciously to a dignified interior. Many a small house has a fine staircase, or a fine chimney-piece, and not infrequently a long corridor so embellished as to become less a dull passage than an interesting vista.

[Examples from Salisbury, Cottes-brooke, Epsom, Milton, etc.]

The Surroundings.

We cannot leave these eighteenth century houses without a brief glance at their surroundings. The early part of the century witnessed the finest efforts of the garden designer, achievements which its closing years were to see, in many instances, destroyed and even effaced.

We have previously seen, as at Hampton Court and Boughton, the beginning of this development. The same ideas were carried on during the first quarter of the eighteenth century. The same kind of fine lay out which characterises Boughton is to be seen on a smaller scale at Lowther and Althorp. Drayton, too, has fine formal gardens. The splendid ironwork at Drayton is rivalled, though hardly surpassed, by that at other large houses, as at Aldenham and Bowood. An orangery, as at Bowood, was a very common feature of large houses. Smaller houses were treated in the same fashion with terraces, flights of steps, and important gateways. Long vistas were continued with some striking object at their termination. At Canon's Ashby is a figure of a shepherd; at Melbourne a statue of Perseus.

Inspiration from the Eighteenth Century.

If we are to seek inspiration from the work of the eighteenth century, we shall find it in two directions—first, in the grand schemes of house and garden combined, and in the general grandeur of treatment bestowed upon the great houses of the time. Not that we are to copy either blindly; but it is very desirable to realise how much the house and its surroundings depend upon each other, and equally desirable to learn how a grandeur of manner may be acquired. Secondly, in the sober and simple houses where the plainness of the general appearance is sometimes unexpectedly broken by the quaint treatment of a door or chimney, and where the joiner's work is full of homely lessons.

It is often from the vernacular architecture of the century that we can get the most useful hints; whereas it is the palatial architecture that gives its stamp to

the period, and goes to furnish the textbooks. The one is for show first, and use second; the other is for use first, and show second. The palatial architecture of the eighteenth century was surely given to us more as a warning than as an example; but it is worthy of attention, just as all phases of architecture are which have acquired any hold on public affection; and we are not likely, in view of our present methods of study, to fall into that attitude of mind towards any style which Evelyn exhibited towards Gothic.

In concluding this final lecture of the series, Mr. Gotch said: To those who approach the subject for practical purposes I would say—Study the past not with a view to mere imitation, but in order to see how its problems were solved. Grasp the details of the problems of to-day, and your knowledge of the past will help you to solve them in a manner suitable to the present. Don't be too original, and you will find that you also are helping forward that great process of evolution which underlies the long series of houses which we have been studying together.

PICTURE EXHIBITIONS.

The Leicester Gallery.

At this Gallery there is a miscellaneous collection of water-colours which is of some interest, as it enables us to compare the styles of different periods and schools, seen in juxtaposition. We have examples of David Cox, De Wint, and Malton, among the older school; George Fripp and Thomas Collier; and we are inclined to wonder why G. Fripp, with his deficiency of any fixed style or aim, was placed so high at one time; and we can recognise that Collier, who belonged to the David Cox school, went beyond his model. Weedon, too, asserts himself in one or two drawings as nearly the equal of Collier occasionally, in the same style. There are some examples of artists nearly forgotten now. W. Bennett, in two drawings of wooded scenery, appears as a very capable landscape artist of a secondary order; but a small drawing of "A Coast Scene" (No. 70) is of higher quality, and as a treatment of sea is remarkably modern in effect. By Allason (now a quite forgotten name) there is a careful, hard, and precise drawing of Milan Cathedral which is meritorious of its kind; the figures, evidently by another hand, are traditionally said to have been put in by Turner. Among modern works are some architectural subjects by Mr. Ernest George, an admirable view in Venice by the late W. W. Deane, and a coast landscape by Mr. Henry Fulwood, "The Little Harbour," which is quite excellent in style and composition.

In another room in the same Gallery is a collection of water-colour landscapes by Mr. Robert Little, not all of them in his best style, but including some very fine things, notably, "Siena—Early Morning"; "Faslane, Gareloch"; and "Golden Cap, Lyme Regis," the latter a remarkable work both in style and composition. All these are among the larger works. In general Mr. Little's power is especially shown in giving an effect of grandeur of style to small drawings, so that they give the effect of large paintings reduced in scale; in the present collection this is hardly so much illustrated as usual.

The Fine Art Society.

Mr. Arthur Garratt's "Pictures of Eton" (oils) are treated in a fine broad style, and

one at least, "Sheep Bridge," is a landscape of high merit; the pictures of portions of the older buildings, interiors and exteriors, are interesting, but landscape is his best point. Miss Rosa Wallis's water-colours of "Flower-time in Highlands and Lowlands," belong to a higher class of work, and are beautiful throughout, more especially the pictures of the flowering meadows and hill-sides of the Tyrol.

The Goupil Gallery.

At this Gallery the Senefelder Club, the object of which is to promote the practice of the art of lithographic reproduction invented by Senefelder, is holding its second exhibition, which affords a useful and instructive illustration of the various effects which can be got by lithography; and also, in some cases, we regret to see, of the misuse that can be made of it to give emphasis to coarse and grotesque inventions; but that is the taste of the day. The value of lithographic drawing as a medium of expression lies mainly in the broad touch and the massing of lights and shadows which can be obtained from the lithographic chalk on the roughened surface of the stone; pen-line drawing on the polished stone, though it used often to be employed in the last generation, is rather a throwing away of the best qualities of the process, and is better produced now by photolithography from a pen drawing on ordinary paper. Lithographic chalk-drawing on the roughened stone has its own effects and capabilities, with a result quite different from anything obtained by photolithography. It was at one time used for a great deal of bad mechanical drawing by men who were mere draughtsmen and not artists, and who made a mere trade of it; but in the hands of an artist it is capable of a variety of fine and powerful effects, as this exhibition testifies. The short description attached to the catalogue omits the most important factor in the process of printing. The lithographic stone has an affinity for grease; the drawing is made on it with a greasy compound, called "lithographic chalk," which is absorbed by the stone; the stone being wet, the antagonism between grease and water acts so that when the roller with lithographic ink is passed over it, the ink is only taken up by the parts of the stones already drawn on. The drawing on the stone has to be made reversed, of course; but a "transfer paper" has been invented on which the drawing can be made without reversing, and then transferred to the stone by pressure. The value of transfer paper is not so much in avoiding reversing as in getting rid of the inconvenience of dealing with a thick and exceedingly heavy block of stone.

In the same gallery is a collection of the paintings of the late Miss Sarah Dodson, an American lady who studied under French teachers, and exhibited at the Salon and elsewhere. Her long design for a frieze of small figures, "La Danse," is clever and well worked out; there is also in the end room a very charming decorative design of nude figures under the title "Les Etoiles du Matin." The rest of her works, though all up to a certain standard of execution, can hardly be said to be of special interest.

The Carfax Gallery.

At this Gallery there is a collection of drawings by Mr. Walter Sickert, among which a clever small sketch of himself painting, and an etching of Dieppe, are the only two for which we can feel the slightest admiration. The remainder consist of rough and crude sketches mostly of figures.

YEAR BOOKS, DIARIES, AND CALENDARS.

"The Master Builders' Handbook, 1911," is the official year-book of the London Master Builders' Association in a new and improved form. Besides a full list of the names and addresses of members of the London Master Builders' Association, there is a condensed history of the Association, leading legal decisions affecting the building trade are concisely summarised, the most recent amendment to the London Building Acts is included, the text of various working rule agreements with the operatives is given, the London Labour Exchanges are listed, and there are many other valuable and interesting features, several of which are now first introduced. The binding and general appearance of the volume have been greatly improved, and copious indexes render it very convenient for reference. The book is now published by Technical Journals, Ltd., Caxton House, Westminster.

"Who's Who" for 1911 is, as usual, bigger than its immediate predecessor, although we do not observe that its bulk is greatly swelled now, or at any time, by the inclusion of an inordinate number of architects. The omission of some notable names in the profession is no doubt due to the shrinking modesty of the architects themselves, since the collection certainly does not err on the side of exclusiveness. The editors, in fact, seem to be altogether too tolerant. It is a delicate matter to suggest that many of the subjects would not be greatly missed if they were left out; but there need be no compunction in point-

ing out that many of the entries could be drastically and advantageously abridged, as, for instance, in the case of the long strings of unimportant works by unimportant authors, or of insignificant appointments held by petty officials. The work as a whole, however, is as useful as it is interesting, and is, in fact, an indispensable work of reference, remarkable alike for its fulness and its accuracy. It is published by Messrs. A. and C. Black, Soho Square.—From the same publishers we have received the extremely useful

"Writers' and Artists' Year Book: A Directory for Writers, Artists, and Photographers, 1911," which, published at 1s. net, is undoubtedly a real boon to those in whose interests it is issued. The particulars with regard to this Journal, however, seem to have escaped revision.

The "Brick and Pottery Trades Diary" presents an ample page (about 8½ins. by 12ins.); the diary, containing three days to a page, and being ruled with six columns for cash, and interleaved with blotting-paper, is preceded by many pages of

HOUSES AT COLWYN BAY

PAIR OF HOUSES AT COLWYN BAY, NORTH WALES. E. H. WOODCOCK, A.R.I.B.A., ARCHITECT.

These houses are built of local bricks, part of the upper storey being rough cast. The roofs are covered with local tiles. There are three entertaining rooms on the ground floor and six bedrooms on the first floor. Special attention was given to the plan in order that there should be no necessity to go out of doors to any of the offices. Internally the houses have been finished in a plain manner, the woodwork being either painted white or stained brown.

information with respect to the interests indicated by the title. The publishers are Maclaren and Sons, Ltd., 37 and 38, Shoe Lane, E.C.

The "Sanitary Record Year Book and Diary" is the twenty-ninth annual issue. The diary is interleaved with blotting-paper, and the memoranda will be found full and useful within their range. The price is 2s. 6d. net, and the publishing office is at 5, Fetter Lane, E.C.—The "Mechanical World Electrical Pocket Book" (6d.: Emmott and Co., Ltd., 65, King's Street, Manchester, and 20, Bedford Street, Strand) contains a large collection of data for mechanical engineers, includes a small diary, and is altogether a marvel for the money. It is in its twenty-fourth year of issue, and is bigger than last year's issue by the addition of thirty-two pages.

Office wall and desk calendars have been received from the Western Electric Co., Ltd., Norfolk House, Victoria Embankment; Equity Life Assurance Society, 18, Lincoln's Inn Fields, W.C.; Poulton and Son, boiler-setting engineers, Reading; the Woudham Cement Co., Ltd., 35, Great St. Helens, E.C. (measuring, by the way, 14ins. by 9½ins., on a mount that is some 5½ins. taller, while the date is in red letters 9ins high; rather overwhelming for an ordinary office, but a capital thing for workshop or warehouse); and William Morris and Co., Ltd., Ruskin House, Rochester Row, Westminster. — The "Minerva Diary and Note Book for 1911" is presented with the compliments of Pinchin, Johnson and Co., Ltd., Minerva House, Bevis Marks, makers of paints, enamels, varnishes, stains, etc., who inform us that they will be pleased to send a copy on request from any bona fide builder or decorator (and we presume also from any architect), provided that a trade or professional card is enclosed. It is a very elegant little leather-bound twin diary and notebook, which anybody would be glad to possess.

ARCHITECTURE CONSIDERED AS PLAN AND SECTION.

Discussion.

The discussion following the reading of Mr. Statham's paper on "Architecture Considered as Plan and Section," at the Architectural Association, on January 9th (the substance of which lecture was printed in last week's Journal), was rather shorter than usual, although the subject was one that might well have been expected to provoke an animated debate.

Mr. Arthur Keen, opening the discussion, said that Mr. Statham had gone to the very basis of things.

Mr. Maurice B. Adams, proposing a vote of thanks, said he was glad that the lecturer had taken so high and monumental an attitude at a time when we seemed to be considerably degenerating. Having seen the Royal Academy students' work recently, the speaker was forced to believe that we did not seem to have the same ideas that animated Street and Burgess, for instance. The latter's two fine drawings, by Haigh, for the Law Courts, the speaker thought might be lost if no effort was made for their preservation.

(It had been previously announced that Street's drawing for the same building had now been presented to the Association.) Drawings nowadays appeared to be getting theatrical. If they looked at competition designs, they would find that the man who succeeded was the one who could grasp the general lay-out of a scheme. The speaker then referred to

Mr. Norman Shaw's plans of London houses, at Kensington, and Queen's Gate, alluding to the ingenious management of staircases and subordinate parts, producing a dignified interior upon a narrow site. He had always thought that the magnificent lay-out and general contour of the Houses of Parliament would outlive the battle waged about Pugin and Barry. That Pugin had a hand in the building there was no doubt, but the conception was Barry's.

Mr. Gerald Horsley, seconding the vote of thanks, said he had enjoyed the lecture immensely. Students, he thought, should study plans to a greater extent than they did; and the habit of roughly indicating plans in the sketch book when on an excursion was distinctly helpful. Mr. Statham had said, in effect, that detail did not matter so long as it was good. [Mr. Statham: "I said what kind of detail."] It was comparatively easy to get a good plan, and to make the drawings of sections and elevations, so long as one worked to a small scale. But the difficulties began when they came to the detail. Mr. Statham's remarks about the Pantheon showed how very important detail was to a building. He also said that the plan of the Houses of Parliament could have been expressed just as well in Renaissance as in Gothic. Surely this was because it was a Renaissance plan. He did not think they would be pleased with the Houses of Parliament if in any other form than at present. They could not sacrifice the Victoria Tower; nor would they like St. Paul's so much had the detail been designed by someone else than Wren.

Mr. W. J. H. Leverton said he was pleased to hear the old bogey contradicted about Pugin having been the architect of the Houses of Parliament. Pugin was a man who belonged to a different school. Burgess's drawings for the Law Courts were for many years in the custody of the South Kensington authorities, who ultimately decided to destroy them; but some were rescued by the Office of Works, from whom the Association might perhaps be able to obtain them.

Mr. Arthur Keen, speaking of Mr. Norman Shaw's plans, referred to a house in Cadogan Square which, by a clever arrangement of plan, had a large entrance hall practically the whole width of the house. He wished that Mr. Statham had included lighting within the scope of his paper as well. Mr. Statham's plan of Whitehall was extremely interesting, and it would be instructive to publish it for purposes of comparison with the work actually carried out. Mr. Statham's paper showed the urgency of planning, as competitions of recent years had shown it to a marked degree. The successful man was the one who produced the successful plan.

Mr. H. H. Statham, in reply, said he felt that there had not been enough sections to illustrate the lecture, but they were rather difficult to obtain. As it had been suggested, he might be able to think about lighting for a future lecture. Pugin was a great sectional designer; and a church appearing to be small outside would have an effect of spaciousness within. With respect to the Pantheon, what he meant was that the greatness of the building was not dependent upon the detail, but rather in spite of it. He queried whether Wren did design the detail of St. Paul's: probably Wren indicated the position of the swags, but they were most likely worked out by the craftsman. Nor-

man Shaw liked high dining-rooms; his own drawing-room was low, and went down six or eight steps to the dining-room. The competition for the Law Courts was historical, and he thought all the drawings should have been preserved. With regard to the scheme for Whitehall, this would probably prove less economical than the one carried out; but at the time there was some talk that all the land up to Craig's Court could be obtained.

TRADE AND CRAFT.

Telephone Apparatus and Supplies.

One of the most complete descriptive catalogues yet published, dealing exclusively with telephone apparatus, is that which has been issued by the Western Electric Company, Ltd., Norfolk House, Victoria Embankment; North Woolwich, Sydney and Johannesburg. All the latest instruments are shown, including those for the central battery system, which has been introduced and perfected by this firm. The characteristic difference between the central battery and the magneto systems is stated as being that in the former the energy requisite for talking and for signalling the Telephone Exchange is supplied to the districts by a single large battery located at the central telephone exchange, whereas in the magneto system each subscriber's telephone is supplied with a battery and a hand generator for talking and signalling. The firm claims that, with more than thirty years' experience in the manufacture and operation of telephones, they have been enabled to develop their central battery apparatus and equipments to the highest degree of excellence. It is pointed out that the principal advantages of the central battery system consist in improved service and lower operating costs, lower maintenance costs, and better transmission. "The character of the signals from the subscriber's telephone to the central exchange results in quicker and more accurate service, rapid disconnections, and great economy in the expense for operators, each operator being able to handle a great many more lines. Economy in maintenance comes from concentration of the apparatus requiring most frequent attention at the central exchange, where it is under the constant care of experienced men whose time is not wasted in frequent journeys to subscribers' telephones. The elimination of the local telephone batteries effects a very considerable economy, while the absence of the battery and of the generator enables the subscribers' sets to be made more compact and pleasing in appearance. The volume of transmission obtained with the central battery system is uniform, whereas that obtained with a magneto system falls off in service as the batteries deteriorate. The magneto system, however, has the advantages of low first cost of equipment, simplicity of construction, and the ability to operate successfully over long lines of which the insulation is not the best. It will probably always be used for long rural lines and in the smaller towns and villages; and the choice between the two systems depends largely on local conditions. Full particulars of both systems are contained in the catalogue, which, indeed, is a very comprehensive guide, copiously illustrated, and having a full index, to every phase and feature of telephone apparatus and supplies. We are informed that copies will be gladly forwarded to firms directly interested in the sale and installation of telephones.

TITE DESIGN FOR A CAMPO SANTO: DETAIL OF CHAPEL AND PORTION OF ENCLOSURE BY V. O. REES.

THE ARCHITECTS' & BUILDERS' JOURNAL.

JANUARY 25th, 1911.

CAXTON HOUSE, WESTMINSTER.

VOLUME 33. No. 835.

NOTE: The List of Contents will be found on page IV. of the front advertisements.

Street Fronts.

HE designing of a front to an ordinary sized street, house or shop, forming the only visible portion of a narrow slice of building crowded up between other similar slices, is an architectural problem of a special character. It is the only kind of architectural design which is concerned with only one side of a building, with no neces-

sity for considering the design of the return sides; and it is the only one in which the architectural treatment is practically independent of plan. A street house almost necessarily means an entrance doorway at one side and the remainder of the ground storey taken up with the windows of the front room; and what is the plan of the part of the house in the rear of the front room can have no influence on the design of the frontage. In the case of a shop there may be either an entrance door at one side, or an entrance in the centre, and so far as that the arrangement of the shop does influence the front design. Above that it is generally a case again of front rooms extending the whole width of the building, and not affected by the back plan, except that a long showroom on the upper floor, running a good way back, will require special provision for lighting.

The dwelling-house front is both the easiest and the pleasantest to deal with. The two principal questions to be settled are: (1) considering that the ground floor must have a door on one side and a window or windows not corresponding to it on the remaining part of the front, is this grouping of openings to be maintained throughout the height of the front, or is the ground storey to be a separate design cut off from the upper portion and the latter treated symmetrically? (2) Is the general principle of the design to be vertical or horizontal?

Our predilection is in favour of cutting off the ground storey, by a strongly marked cornice, and by a different or differently treated material, from the upper part of the front; where, as is almost always the case, the first floor room forms a large room across the whole width of the building, this is the treatment most in accordance with the facts. The system is sometimes adopted of making a bay window on one side of the front door, and carrying this up through two or three storeys. There is a certain picturesqueness of effect thus obtained, and it gives a little variety to the plan of the first floor room, but there is always some difficulty in dealing with the termination of this bay above, where it clashes with the almost necessarily centre line of the roof. A better result is generally obtained by treating the ground storey separately and keeping a central axis line above it.

As to the question of vertical or horizontal treatment, it depends no doubt a little on the style of detail adopted; but as a house is a building divided into storeys which are of somewhat different character, the horizontal division seems the most suitable. Grouping windows vertically, within two or three lofty recesses between main piles, is more a kind of treatment for a warehouse than a dwelling-house. As in most cases in a street residence the front first floor room is the principal room, and at any rate this is the principal

floor of the house, the windows of that storey call for a specially emphasised treatment in design and decoration or mouldings. They should not be grouped with the upper windows belonging to storeys of less importance. There will usually be found the possibility of treating the top range of windows in a manner different from all the rest—more numerous, smaller, and closer together, so that they give the idea of a kind of frieze—a half playful finishing storey to the building.

Whether a street front should be gabled or not depends a good deal on what is the general character of the remainder of the street; also, of course, on the style of detail adopted, and whether the general treatment is vertical or horizontal. Granting that the horizontal treatment is the best architecturally, there is no doubt that the horizontal termination, with a balustrade, is the most suitable and the most convenient. It is a question whether the gable termination for street houses ought not to be regarded as a thing of the past. We fully admit its picturesqueness, but it is inconvenient for roof drainage, and it does not represent modern ideas and facilities in roof construction. We have come to a period in constructional facilities in which sloping roofs are no longer a practical necessity for throwing off rain; we can now, at no exorbitant cost, make roofs flat and at the same time impervious; and there would be many advantages in adopting them as the general covering of street houses. Among other things, they would afford facilities for the formation of roof gardens; a great addition to the amenities of life in town districts that are too closely crowded to admit of a private garden to each residence.

A point which ought always to be considered in designing narrow house fronts, but which is often neglected, is the provision for the termination of cornices and mouldings. As a property, a street house front is bounded by the centre line of the party wall. A cornice or moulding forming part of the design should not therefore go beyond this division line. To cut it off square is of course a very clumsy expedient; what has sometimes been done, and ought always to be done, is to keep the margin of the actual design a little within the line of the party-wall centre—a few inches or a foot—and to return the cornice on itself within the party-wall centre-line. This is most neatly done by setting back the face of the wall a little at each side, leaving a strip of wall which is legally part of the tenement, but is not part of the design, and against which any projecting cornice can be stopped either by a return on itself or by a console or other such feature introduced to stop it. But the return of the cornice on itself is in general both the best and easiest way of doing it.

Shop fronts, to which a good many of the above remarks apply equally, differ from house-fronts in that they may have central entrances instead of side ones, which renders it more easy to obtain an axial balance to the design, and in that they demand a great expanse of window in the ground storey, and sometimes, where there is a show-room above, in the first-floor storey also. This is one of the great architectural difficulties in the treatment of shop fronts, since it is almost impossible to render a front architecturally satisfactory in which all the lower part is glass. In this case, and

where there is no showroom immediately over the shop, the conditions imperatively demand that the ground-storey should be separated from the rest of the front by a strongly defined cornice of its own, and be treated as a special design. In regard to the great expanse of glass, there are some signs of a relaxation of the demands of tradesmen in this respect; some of them are beginning to perceive that an effectively designed shop front, with some appearance of architectural stability about it, may be a sufficiently good advertisement to atone for the loss of some portion of the traditional expanse of plate glass. It would be very desirable that, in a masonry design, the necessarily large opening of the shop front should be bridged by an honestly constructed arch; but where this cannot be done, the iron girder which must take the place of the arch ought to be visibly brought to the front, and decoratively treated in some way. To use it as a secret and hidden means of holding up an apparent stone arch in front which we know could not stand if it were really built as it pretends to be, is a flagrant disregard of the best principles both of architecture and building. In the methods of using iron constructively and at the same time architecturally in shop fronts the Germans are far beyond us in ingenuity of construction and variety of design; and English architects who are likely to have much practice in this class of building would do well to take hints from the many clever and original designs for shop architecture which are to be found in various issues of the "Berliner-Architekturwelt."

Where a large showroom comes immediately above the ground-floor shop, a fine and bold effect may be produced by combining the windows of both under one lofty arch, the floor between the two forming a visible feature in the metal structural design included under the arch.

The Sanity of Genius.

SIR WILLIAM RICHMOND had some interesting things to say about genius in his concluding lecture at the Royal Exchange last week. Genius had been thought by the Greeks to be a state of extraordinary excitation, and by Carlyle to be a capacity for taking pains. Probably it combined both, but the great geniuses had all been essentially sane. Eccentricity was not necessarily genius; if it were there would be a great many more geniuses than there were. Success depended both on industry and on purity of motive. The half-genius ceased to be remembered when his paradox was forgotten. But true genius would survive, as that of Homer had done. It was intimately associated with simplicity, and the man of genius both believed and disbelieved in his ego, knowing that only will could keep his power in a straight course. Art was for him a constant struggle for truth, as it had been for Michelangelo, who also pursued the ideal of liberty, and took the human form as an instrument whereby he might express all the emotions of the soul. The frivolous courtesan of Florence had no inspiration for him. His Virgin was not a jewelled lady, but a peasant and an impassioned mother. He saw right into the heart of human beauty. But scarcely anything that he conceived was finished—there was always the sense of waiting to accomplish. Yet he finished the Sistine Chapel with its thousand thoughts and countless beauties, constituting altogether the world's highest achievement in the art of design. There was a story running right through it; it was an allegory of Redemption and Liberty. The masterly figures of youthful vigour, which some had thought had no connection with the scheme, really typified the struggle for freedom from the shackles of Church and State. This motive was continually reiterated in Michelangelo's art; it concerned the story of the human race which he illustrated in abstract humanity. Liberty of thought—that was part of the great ethic idea, which comprised the perfection of creation, the failure to maintain it, and the struggle to recover it.

Building Interests in the New Parliament.

THERE are 128 English, Welsh, and Irish Private Bills, and 12 Scotch Provisional Orders deposited in the Private Bill Office for consideration in the ensuing Parliamentary Session. This is a slight increase on last year, but a very considerable falling off from a few years ago. No schemes of any particular novelty are being brought forward, but considerable interest will doubtless attach to the fate of the Bills for what is known as the railless trolley system of tramways. Last session the Corporation of Leeds and Bradford were given powers to install this system, and now a number of other local authorities and several private promoters are asking for similar powers. The proposed Greater London Railway will also be a matter of great interest, as the proposal is to construct a line from Feltham, to run through the growing urban districts of the North and East of London, and finally to terminate at the Docks. Junctions with all the great trunk lines of the North are contemplated.

The Annual Meeting of the National Federation.

AMONG the subjects on the agenda of the annual general meeting of the National Federation of Building Trades Employers of Great Britain and Ireland, which is being held to-day at the Trocadero Restaurant, Piccadilly, W., the chief matters of trade importance that are set down for discussion are the following (a) "Are architects justified in endeavouring to enforce the literal interpretation of obsolete specification descriptions in respect to materials?" (b) "The desirability of the building trade adopting a holiday scheme." (a) was to be opened by Mr. R. Arthur Costain (Liverpool) and Mr. J. Morice Wright (Sunderland), and (b) by Mr. G. Bird-Godson (London). With regard to (a), the terms are sufficiently explicit to indicate the intention. It has been on several occasions shown in this Journal that builders and contractors are frequently subjected to embarrassment, and occasionally to loss, by the specification of materials that can no longer be obtained, or have been superseded by goods that are at once cheaper and better for the purposes in view. Many—perhaps most—architects know quite well that in certain instances substitutes must be used, yet nevertheless they go on employing the obsolete descriptions. Conventional fictions of this kind are no doubt fairly prevalent in other industries also, and, the convention being mutually understood, no difficulty need arise where there is good faith on both sides. Given a cantankerous architect, however (and, impossible though it may appear, such phenomenally constituted gentlemen do occasionally flit across the builders' horizon), it is possible for him to put the contractor to a vast amount of harassing search and enquiry for materials that are possibly not procurable at all, or can only be got at prohibitive prices; while the ultimate failure to adhere to the strict letter of the specification may be made to assume a very serious aspect in a court of law, a judge or jury having little or no technical knowledge of such matters, and, mistrusting the allegations of "custom of the trade," being particularly prone to conceive a most detrimental prejudice against the builder who admits that he used substitutes; the explanation of the fact being too often regarded as merely a more or less lame excuse. It is upon some such lines as these, probably, that to-day's discussion will run. As to (b) the question probably is whether or not it may be desirable to appoint a general or simultaneous "close time" during some convenient period of the year, so that the inconveniences arising from the present unconcerned system may be avoided. Among further matters set down for consideration are a report on recommendations in regard to Clause 30 of the Agreed Form of Contract, and a report on a former resolution "that the Administrative Committee be requested to take into consideration and advise upon the best means of approaching

local authorities with a view to the general adoption by them of the National Form of Contract." The meeting will also be asked to consider the desirability of the Federation becoming affiliated to the International Federation of Building and Public Works Contractors; and there will, of course, be the usual routine business, which includes the annual election of officers and representatives. Councillor Smethurst, J.P., having fulfilled his term as President with marked distinction—his year of unremitting and enthusiastic devotion to the business and the cause of the Federation earning for him a very special meed of recognition—will make way for Mr. J. W. White, of Sunderland, whose position as senior vice-president, if the normal course be followed, will be assumed by Mr. James Wright, of Nottingham; while the hon. treasurer, Mr. Frederick Higgs, of London, should succeed to the junior vice-presidency, vacated by Mr. Wright. A report of the meeting will appear next week.

A Definition of Paint.

SOME daring spirits are out on the perilous quest for a definition of paint. One exacting expert insists, in his vigour, that "a definition must embrace all general principles, and must be free from every limitation, actual and possible, present or future," in which one can but particularly admire the scorn of time and of the changes that it is supposed to bring. The following definition, taken from a popular dictionary by this correspondent, seems to fall somewhat short of his ideal:—"Paint: a substance used in painting." It recalls for us the very joyous memory of an exquisitely neat definition we once saw in an architectural glossary: "Cow-shed: a shed for cows," which has always struck us as being profoundly thought out, although its helpfulness is perhaps somewhat marred by its severe technicality of expression. Pursuing its researches in the popular dictionary, the correspondent finds that "to paint" is "to cover or besmear with colour." Fastidious as he is, this fails to afford him full satisfaction. He suggests that "a suitable definition could be framed somewhat on the following lines: Paint: a self-hardening adhesive mixture consisting of particles of solid matter (pigments), suspended in liquid," and that "to this might be added by way of amplification: Paint must be capable of easy application; it must adequately beautify and reasonably protect the surface to which it is properly applied." This is offered "as a basis for general criticism, in the hope that a satisfactory solution may be ultimately arrived at." Personally, so long as the stuff itself is satisfactory, we do not feel greatly inclined to worry much about the definition.

The Placing of Carving.

SOME interesting observations on carving are made by Mr. W. Aumonier, Jr., in a paper read before the Architectural Association, and published in the January issue of the Association "Journal." Referring to the placing of carving, Mr. Aumonier contends that the architect should certainly consult his carver before giving the builder any details for the carving. "The carver should always be allowed to make his own setting out for the stone required for carving. His practical experience of carving may be of service, for what looks nice on a flat drawing in your office, may be quite wasted in a London street. Above all, concentrate your carving; do not fritter it all over the building. If funds are limited, spend your money round the doorway. Remember that is the average line of sight; make a brave show at the entrance, and rely on architectural proportions for the rest. . . . It is no use putting a mass of sculpture at the top of a building roof, high in a street only 40 or 50 ft. wide. Remember the Parthenon was not designed for Cornhill. The reason we put carving on buildings, I take it, is to enrich the architecture, to bring a play of black shadows and soft undertones in bands or

masses upon the building's face. You must take into consideration the soot of London: how it will hide in time your highly carved modillions. Your building will be new only a little time, but it may be blackened for centuries. Realise the power of this change as you design it, and put your carving where it will be washed by the rain. Look at St. Paul's, and see the effect of this, or at St. Martin's Church, which I consider the finest piece of scene painting nature has ever done, owing to the prevailing south-west winds and rain always washing one side only of the columns."

Restoration at Ripon Minster.

Restoration work has been in progress at Ripon Minster for some months. First to be dealt with were the flying buttresses of the choir, two of which had the greater part of the arch renewed. This was rendered necessary owing to the decay of the grit-stone with which they were restored forty-five years ago. The arches have been renewed in Tadcaster limestone. The Transitional arcading on the clerestory of the choir has been restored where necessary in grit-stone from Pateley Bridge. A "pilaster" buttress on the west side of the north transept has had to be largely repaired owing to a gargoyle above discharging, so that the wind drove the water on to the face of the building, and as a consequence the softer stones perished. Considerable repair has been required on the Perpendicular buttresses on the nave, which, with the possible exception of the apsidal east end of the Lady loft, or library, form the finest external feature of the minster. On the gablets to these buttresses many of the carved crockets and finials are not only shattered, but shapeless. They also have been restored in Tadcaster limestone, together with various repairs to tracery and hood-mouldings, which had not been included in the previous restoration, and had now become urgent. The architect for the work is Mr. J. Oldrid Scott, and the contractor, Mr. T. S. Ullathorne, of Selby. The carving has been executed by Mr. John Baker, of London.

Suggestions for the Royal Academy.

In the columns of the "Morning Post," a discussion has been proceeding on the subject of the holding of a Winter Exhibition of Water-Colours at the Royal Academy. Mr. Walter Crane, one of the correspondents, expresses himself as very dubious as to the necessity for holding such an exhibition, and incidentally makes reference to the recent Town Planning Exhibition, which, he adds, tended to foster the idea that this was the beginning of a new era in Academy exhibitions, and that larger ideas of the scope of art were to be entertained. "There was, indeed, a splendid suggestion emanating from the Royal Institute of British Architects—that an exhibition of decorative art should be held at Burlington House as a winter show in which mural painting and design in association with architecture might be displayed; but, though well received, and even actually entertained for a time, it is disappointing to hear this idea has now been abandoned. One feels, therefore, rather hopeless about offering suggestions to the Royal Academy, who probably do not feel at all in want of them. . . ."

The Cinderella of the Arts.

A writer in the "Manchester Guardian" observes that very few Londoners, it is believed, spent any of their Christmas holidays walking about the town inspecting the new buildings added to London during the year. In Regency days contemporary architecture was "spied" on and "quizzed" a great deal by lay critics who wrote books and pamphlets on the subject, and we can see from the caricatures of the time that a new edifice of any individuality was the talk of the town. "In the eighteenth century every man of family

TITE PRIZE DESIGN FOR A CAMPO SANTO. BY G. H. FOGGITT.

was supposed to know something of architecture, and to have acquired correct opinions on the art during the grand tour. Even so late as Mid-Victorian days people sometimes became excited about architecture, and considered it something to have an opinion on, just as one had opinions on pictures. In our day architecture seems to have largely dropped out of public interest, except as regards questions of cost when the buildings are public ones. Of course many architects prefer this present public neglect, as they hold that it tends to free them from interference on the æsthetic side of their work from clients or committees with a little knowledge and many fancies. They point to the fact that the general level of London architecture is now higher than it has been for at least a century as a proof of their contention that architecture's laws architecture's patrons should give only so far as practical requirements are concerned. That, however, is not a view that has the support of Mr. Belcher and other heads of the profession, nor is it the case that the client who has thought nothing about architecture refrains from insisting on laying down the law that his Peckham chalet must look as like Chatsworth as possible at the money."

Kent County Council Offices.

The new buildings which have been designed for the Kent County Council by Mr. F. W. Ruck, the County Architect, are in Renaissance style, with rusticated work in grey granite surrounding the archways up to the ground floor, while the central three-storeyed portion will be faced in Portland stone; the wings and all the fronts facing the inner court being in Kentish rag and Portland stone. The Kentish rag will be carefully selected from the hardest beds of the best quarries, and will have a rock face. The council chamber is 52ft. by 39ft., and is placed on the first floor, at the north

corner of the site. The cost of the building, including the alterations to the present waiting halls to the Courts, Treasurer's, and Indictment offices, etc., calculated upon the estimated contents of 948,000 cubic ft., at 12d. per foot, will be £47,400, which sum should be sufficient to complete the work, including heating, lighting, and ventilation, but excluding the internal fittings of the Council Chamber, Grand Committee Room, and offices.

The Institute Competition Designs.

WE publish as a centre plate in this issue the Soane Medallion prize design for "An Entrance Gateway to a Capital City," by Mr. Prentice Mawson (who, it may be mentioned, is the son of Mr. Thomas Mawson, the well-known garden architect). We are also able to publish the Tite prize design for a Campo Santo by Mr. G. H. Foggitt, and the design for the same subject by Mr. V. O. Rees, which gained honourable mention. In our issue for last week we gave a detailed criticism of the several designs submitted in the competitions, but a few particulars may here be given in connection with the accompanying illustrations. The conditions for the Soane design set forth that there should be a gateway and gatehouse of monumental character, approached by a bridge over a river 120ft. wide. The Tite competition was for a Campo Santo on a rocky island rising out of an inland lake, and was to comprise a chapel of large dimensions with cloisters attached to it, providing wall and floor space for monuments and inscriptions; suitable provision also being made for fifteen gardeners and a resident surveyor. The disposition of the prize design is clearly shown by the plan on the opposite page, the chapel being centrally placed, and the cloisters carried on raised terraces on either side.

ARCHITECTS AND ACTIONS
FOR NEGLIGENCE.

Although the architect is seldom heard of as a defendant in an action for negligence, he is, nevertheless, exposed to attack, and may, at some time or other, have to justify his actions. His liability, however, is always limited by this—that he is generally employed either to give his professional opinion, or carry out work in the manner which he considers best. He cannot be held responsible for an erroneous opinion, or for an error in judgment. Just as a doctor cannot guarantee a cure, and just as the lawyer cannot undertake to win every case, so the architect cannot ensure the possibility of every scheme which he devises.

The question—What is reasonable care which an architect ought to display in the performance of his work?—is one which must be answered by reference to all the surrounding circumstances. The degree of skill is such as may be expected in the circumstances of time and place from an average person in the profession—one neither specially gifted nor extraordinarily dull. Where this reasonable amount of information and skill proportioned to the duties that are undertaken is found, there is no liability for errors of judgment in the application of knowledge. Each case must depend on its own circumstances; with the paramount consideration that when an injury has been sustained that could not have arisen from the absence of reasonable skill or diligence, then there is no liability. To render a professional man liable for negligence, it is not enough that there has been a less degree of skill than some other professional man might have shown. Extraordinary skill is not required unless professed or contracted for; a fair average degree of skill is all that can be insisted on. Or, as it has been laid down by an old judge, a person who enters a learned profession undertakes to bring to the exercise of his business nothing more than a reasonable degree of skill and care. He does not undertake, if he is an attorney, that he will gain a cause at all events; or, if he is a physician, that he will effect a cure; nor does he undertake

to use the highest possible degree of skill. There may be persons who have higher education and greater advantages than he has, but he undertakes to bring a fair, reasonable, and competent degree of skill.

While an architect may be held liable for negligence, if he is found to be wanting in the competent skill of an engineer, he will not be responsible for defects resulting from methods of construction which his employer orders him to adopt. This principle has been applied to the case of an architect. In the case of *Turner v. Garland*, 1853, 2 H.B.C. 2, an architect was employed to prepare plans for and superintend the erection of certain model lodging houses, in accordance with the latest improvements. Amongst other things, his employer told him to put in a new patent concrete roofing, which cost only a quarter of what lead or slate would have cost. This roof proved a failure, and had to be replaced in a few years at a cost of £230. The architect was sued for negligence. In summing up, Erle, J., said: "If the architect possesses competent skill, and was guilty of gross negligence, although of competent skill, he might become liable. If he were of competent skill, and paid careful attention to what he undertook, he would not be liable. You should bear in mind that if the building is of an ordinary description, in which he had had abundance of experience, and it proved a failure, this is evidence of want of skill or attention. But if the building is out of the ordinary course, and you employ him about a novel thing about which he has had little experience, failure may be consistent with skill." In the event, the architect was held not liable. In this case it will be observed that the use of the roof in question was suggested by the employer himself: had it been recommended by the architect, he would probably have been held responsible for its ultimate failure.

It would seem that an architect is bound to have some slight acquaintance with the law in order to protect his clients from the risk of having actions for trespass brought against them.

In the Irish case of *Monks v. Dillon*, 1884, 12 L.R. Ir., 321, works were executed by a contractor for a drainage board under the superintendence of their

engineer, who had prepared the plans and often saw the works while in progress. Some of the works amounted to a trespass on the plaintiff's land. It was decided that the engineer was liable for the trespass committed.

Similarly, it is apprehended that an architect should be acquainted with the local by-laws, etc., in order that he may protect his client. Within the Metropolitan area, for instance, the provisions of the London Building Act may have to be observed.

The results of negligence in supervising were illustrated in the case of *Jameson v. Simon* (1899, 1F.1211). There the defendant, an architect, was employed in the usual way, in connection with the building of a house, in part of which there was to be a cement floor. The foundations for this floor were made of improper materials, with the result that dry-rot broke out in the woodwork after the house was completed. The building owner sued the architect for negligence and for passing, as sound, work which was really unsound. It was held that the architect was liable as he failed to exercise proper supervision, and that it is the duty of an architect to give such supervision as will reasonably enable him to certify that the work of the contractor is according to contract. The duty of an architect was thus declared by the Lord Justice Clerk: "He, or someone representing him, should undoubtedly see to the principal parts of the work before they are hid from view, and, if need be, I think he should require a contractor to give notice before an operation is to be done which will prevent his so inspecting an important part of the work as to be able to give his certificate upon knowledge, and not on assumption as to how work hidden from view had been done."

There are cases which appear to establish that an architect may be held liable for negligence in preparing an estimate of the price of the work done. He must exercise reasonable care; and may be held responsible if he relies on erroneous calculations. In order to ascertain what is reasonable care, it must be remembered that if the architect's estimate is made before working drawings and specifications are prepared, he has but sketch plans and a rough description of materials to estimate upon; for it is to avoid the expense of preparing working plans and specifications that the building owner asks as a rule for an estimate of the cost at this stage of the work. It is a question for a jury whether it is a condition, express or implied, of the contract that the estimate shall be reasonably near the actual cost (*Nelson v. Spooner*, 1861, 2 F. and F. 613). In *Monneypenny v. Hartland*, 1826, 2 C. and P. 379, the plaintiff was employed as architect by a committee to build Mythe Bridge across the Severn. In estimating for the erection of the bridge and the approaches thereto, he relied on the borings taken by a surveyor who had been previously employed by the committee, and took no steps to ascertain for himself the character of the ground forming the site of the intended works. The soil proved bad for the foundations, and it turned out that much deeper foundations were necessary than the plaintiff had anticipated. It was held that he could not recover his fees. Best, C.J., in giving judgment, said: "If a surveyor delivers an estimate greatly below the sum at which a work can be done, and thereby induces a private person to undertake what he would not otherwise do, then I think he is not entitled to recover

his fees. I think it is of great importance to the public that gentlemen in the situation of the plaintiff should know that if they make estimates, and do not use all reasonable care to make themselves informed, they are not entitled to recover anything."

If an architect does not certify, and the employers take advantage of his failure to do so in order to escape liability under the contract, there is one case which decides that the contractor may sue for and obtain his money. In *Kellett v. New Mills Urban District Council*, 1900, 2 H.B.C. 329, a contractor brought an action for the balance of the price of work done under a contract and for extras. The defendants, in answer to the claim, alleged that no final certificate for the contract had been made out by the engineers, and that the engineers had not certified that the whole was in a good and substantial state of repair or delivered up to their satisfaction as executed in compliance with the contract. By way of reply to this defence, the contractor alleged that he had done all the work which he agreed to do under the contract. He also claimed that the engineers were the servants or agents of the employers for the purpose of certifying the date of completion, and the amounts payable on such completion. It was further alleged that instead of determining the date of completion, or certifying what was due, the engineers had wilfully, arbitrarily, and persistently refused to determine and certify either the date or the amount, and that, in the result, they were discharged from their position as engineers. It was also urged that the defendants took advantage of this conduct of the engineers so as to prevent the contractor from receiving or recovering payment of the amount due to him for the completed works. Fraud was not suggested. A jury found that the works were completed: that the engineers had failed to certify; and that the defendants, being aware of such refusal, had taken advantage of it so as to refuse or unreasonably delay payment. It was held that the contractor could recover from the defendants without a certificate. Mr. Justice Phillimore said: "I am of opinion that the decisions are clear that where the employer colludes with the engineer, surveyor, or valuer, it is right to pass the engineer, surveyor, or valuer by, and to seek the determination of the Courts as in an ordinary contract; and I see no difference between the misconduct of the engineer, surveyor, or valuer being procured by the employer, and the employer knowingly taking advantage of the man's original misconduct. . . . I think they knew here, not merely that the engineer was not certifying, but that he was going through the process of pretended inquiry, which was almost worse than his refusing to inquire."

It may be taken, then, that for better or worse, a contractor places himself in the hands of the architect nominated by the building owner; and unless there is fraud or collusion, the terms of the contract cannot be ignored. As there is no wrong without a remedy, the contractor can recover against the architect, or else call upon the employer to appoint, or concur in the appointment of, an engineer who will grant the necessary certificate.

A question may sometimes arise as to who is entitled to sue the architect for negligence. He acts as an intermediary between employer and contractor. Which of these two parties may support a claim for damage?

It cannot be too often pointed out that the relation of the architect to the contractor is not the same as his relation to the employer. So far as the contractor is concerned, the architect cannot be held liable for negligence. The contractor accepts him as an intermediary between himself and the employer, to determine questions arising under the contract, and an opinion or decision, honestly given, cannot be questioned in a court of law. Thus the contractor cannot sue the architect if it turns out to be a disastrous undertaking. With the employer, however, the relations of the architect are very different. He is the servant of the employer, and can be held liable for negligence.

THE VISTA AND THE RING.

A COMPARISON OF PARIS AND VIENNA.

"Some Notes on the Street Architecture of Paris and Vienna" formed the subject of a lecture given before the Liverpool Architectural Society last week by Mr. L. P. Abercrombie. The lecturer said he wished to illustrate in a general way some broad types of street grouping and design, and more particularly two special treatments—the Vista and the Ring. The former was perhaps better shown in Paris than elsewhere, while the latter was seen to advantage in the Ringstrasse of Vienna. The idea of a true vista, he took it, was twofold—it consisted in the elaboration and internal study of one building and the self-effacement of the avenue leading up to it. That naturally led to a double result. The first was the production of the very finest possible monuments; the other concerned the architecture leading up to the monuments.

Describing the chief avenues of Paris, Mr. Abercrombie remarked that the most energetic tidier up and straightener of vistas was Haussmann, who made them, and rightly so, the normal effect of Parisian architecture. The other typical phase of restrained town architecture for which Paris was famous was the square, in which an "ordonnance," or imposed architectural façade had been carried round, irrespective of different buildings inside. Instead of the monument acting as compensation for lack of variety, there was either the pure geometrical shape of the "place," or the immensely important rhythmic value of pure repetition. Sometimes, however, there was a monument in a square in the same way that there was one to a vista.

As to the architecture of Vienna, he said, roughly speaking, it might be divided into three groups, the Baroque of the first half of the eighteenth century, the period of the building of the Ringstrasse, and the new art of this century. A general prevailing characteristic common to Vienna architecture was the complete absence of German picturesqueness, and the strong prevalence of horizontal lines. The Baroque was found in the narrow, tortuous streets of the inner town, and in the range of buildings which formed the façade of the outer town facing the Glacis still to be traced at the back of the Ringstrasse. The second period consisted of the buildings lining the Ringstrasse, and the new art was chiefly to be found in the suburbs, and in the form of pavilions and monuments in the park. The Viennese did not appear to have trusted the new art architects with, or there had been no occasion for, a new building on the grand scale since this phase of design became prevalent in all the lesser arts and many of the lesser buildings.

Among the great urban styles of architecture which had been evolved in Europe—the mediæval in Nuremberg and Flanders, the styles of the three Louis and the two Napoleons in Paris, the Georgian brick of the London squares, and the stone of Bath and Edinburgh—the Viennese Baroque of the first half of the eighteenth century certainly held a high place. Modern Viennese architecture had its great opportunity, denied to the Baroque, on the formation of the Ringstrasse, and the demand for at least ten buildings of the first magnitude, and twice as many public buildings of secondary importance; with the site, setting, and general surroundings in most cases carefully arranged for each building, and its effect in relation to its neighbours consciously studied. Unfortunately, it could hardly be said to have risen to the occasion. In places the Ring appeared to be an exhibition of samples of different architectural styles. A worse feature even than this motley eclecticism was the smallness of scale which characterised these large buildings, with the exception, perhaps, of the Town Hall, the Parliament House, and the theatre.

Mr. W. H. Lever moved a vote of thanks to the lecturer, and remarked that while he had never visited Vienna, what he had heard from Mr. Abercrombie had disillusioned him regarding its architecture, which he had imagined was on a finer scale. The surroundings of flowers and trees were evidently much grander than the buildings. As to the vistas, which Vienna lacked, and which Paris possessed in abundance, he hoped English cities would not become slaves to the idea of the vista. Many Continental cities, he thought, tended to monotony; there was a greater charm about the variety of English cities. But with respect to Haussmann's planning of Paris, he mentioned that, although costing twice the amount estimated, it had yielded the city cent. per cent. per annum in the patronage of visitors, and had proved the best civic investment Paris had ever made.

OBITUARY.

Mr. Andrew Murray.

Mr. Andrew Murray, F.R.I.B.A., formerly City Surveyor, died rather suddenly on Tuesday last week at his residence at Marlborough Hill, St. John's Wood, aged 72. Educated at the City of London School, he entered the service of the Corporation in 1854 in the Architect's Department, and remained until 1906, when he retired on a pension. He served under three City architects—Mr. J. B. Bunning, Sir Horace Jones, and Mr. A. M. Peebles. On the death of the last named in 1891 Mr. Murray was appointed his successor under the title of "City Surveyor." During his association with the Corporation, Mr. Murray was responsible, wholly or as a subordinate, for many of the buildings erected by the Corporation, including some of the markets and schools belonging to the City.

Mr. John Wales.

The mystery surrounding the disappearance of Mr. John Wales, a Walton-on-Thames architect, has been solved by the finding of his body in the river at Hampton in an advanced stage of decomposition. Mr. Wales, who was 42 years of age, had been a sufferer from cancer, and after his disappearance on December 1st a bloodstained razor and a quantity of blood were found in his bedroom, together with a note intimating that he had gone to the river.

Side Facade

SOANE MEDALLION DESIGN FOR "AN ENTRANCE GATEWAY TO A CAPITAL CITY." BY PRENTICE MAWSON.

The walls and columns are of Painswick stone, and the floor and stairs are of Pentelikon and Irish black marbles. The balustrading is of bronze.

STAIRCASE AT NO. 10, CARLTON HOUSE TERRACE, LONDON. DETMAR BLOW AND FERNAND BILLEREY, ARCHITECTS.

EGYPTIAN ART.

In a paper which he read before the York and Yorkshire Architectural Society on January 11th, Mr. J. Stuart Syme said Egyptian art, as might be expected from the remote position it occupies in history, was very closely dependent for its characteristics on those of the race which practised it, and on the conditions under which it lived, and no study of the one is complete without the other.

Apart from articles of domestic use, toilet appliances and the like, there is little that is left to us which was not connected in some way with the religious life of the people, and with their profound belief in the immortality of the soul. Had it not been for this belief we can hardly suppose that they would have been at such pains to construct and adorn with such wealth of sculpture and painted decoration the various tombs and monuments from which chiefly we obtain our knowledge of their life and art.

So far as we can judge from contemporary records, the tools employed for carving in wood or stone, and the method of using them, did not differ greatly from those in use at the present day. In addition to various chisels and mallets, they used the bow-drill, the saw, and the gouge. They were very partial to the use of the adze in wood-working. The tools were of bronze and iron, and we have no evidence that they had any knowledge of steel, or had any method of tempering to an unusual degree of hardness. Wooden statues, if of large size, were framed up owing to lack of large timber. The Egyptian artists were very skilful in line drawing, which was really the basis both of their decorative painting and their bas-reliefs. They had regular methods of study for beginners, arranged progressively from simple objects to finished heads, capitals, etc. The models consisted of small plaques and cubes showing the object in various stages of execution. Bas-relief proper was not so much employed for surface decoration as simple incised work, or what has been called "relieved intaglio," in which the object was outlined with deeply incised lines, and swelled out gradually from the bottom of the recess thus formed, and slightly modelled. The bas-reliefs were almost invariably painted, the colours being used fairly pure and on conventional rather than naturalistic lines. Statues in sandstone, limestone, or wood were also painted, but those in granite or other hard stone were more highly finished off, and brought to a fine polish. Egyptian art did not undergo any marked development, once the characteristics of the style had been fairly established, and the differences were rather in degree than in kind, except as regards minor details of costume, technique, etc. The most vigorous work originated early during the ancient Empire, and some of the best examples date from about the Fifth Dynasty. From that time onward the tide of excellence ebbed and flowed, through the Middle Empire, till in the New Empire, after the overthrow of the "Shepherd Kings," issued a Renaissance during which the quality of the work produced probably excelled that of any other period. All Egyptian art, both in painting and sculpture, is extremely conventional, and many of their mannerisms and methods may appear crude and unjustifiable, but they were probably dictated by considerations which, in the circumstances, were fit and proper. Their decorations were, in fact, not mere ornament,

but rather histories and tales written for a purpose in a lazy age, the times of which were clearly defined and would be understood of all, and with an art which is worthy to rank high among the best the world has seen. Mr. Bellamy proposed a vote of thanks, which was seconded by Mr. R. R. T. Smith, and the lecturer briefly responded.

COMMERCIALISM AND ITS EFFECT
ON HANDICRAFT.

The growth of commercialism was the principal reason put forward by Mr. S. Perkins Pick, F.R.I.B.A., of Leicester, to account for the decline of artistic handicraft, on which subject he lectured before the Sheffield Society of Architects and Surveyors last week. He suggested that the deterioration was caused when the old guild methods were abandoned. The chief object of the guild conditions seemed to have been to ensure that only the best class of work should be done. The mediæval apprenticeship customs prevailed in all handicrafts from early days to the end of the eighteenth century, when manufacturing, with its specialising in departments, gradually destroyed that unity which was such a valuable outcome of the old-fashioned methods. The decline at the end of the eighteenth century was not confined to England and English work, but was experienced throughout all the more civilised countries of Europe. The advance of science during the nineteenth century, with its numerous inventions and discoveries, offered facilities for producing vast numbers of sham and cheap imitations of works more properly made by other methods, thus neglecting honesty—the first essential of true art. The lecturer showed a series of slides of silver, iron, and wooden articles, contrasting the early and later examples, and thus showing how the mid-nineteenth century work fell behind that of the earlier period.

CORRESPONDENCE.

"The Preliminaries of School Planning."
To the Editor of THE ARCHITECTS' AND
BUILDERS' JOURNAL.

SIR,—On page 668 of your issue for December 28th, 1910, I see a misprint in my lecture on schools, viz., on last line but five, "windows" should be "winders." I may add that windows on staircases are best placed at the ends of the flights.

P. A. ROBSON.

Westminster.

Cavity Walls.

To the Editor of THE ARCHITECTS' AND
BUILDERS' JOURNAL.

SIR,—In a recent paragraph headed "Cavity Walls," the reasons for and against their use are briefly referred to, but among the latter there is no mention of a very strong objection which is within my experience. I allude to the transmission of sound from one room to another. In one case I recall, the nuisance was so great that the original use of the rooms had to be discontinued altogether, as ordinary conversation between the occupants of the ground floor rooms could be distinctly heard by those on the second floor. It would be interesting to know if this peculiarity has been noticed by others.

FREDK. CHATTERTON.

Cairo.

LONDON MASTER BUILDERS'
ASSOCIATION.*Monthly Report.*

The usual monthly meeting of the Council was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, the 19th inst., under the chairmanship of Mr. Leonard Horner (president).

Deep regret was expressed at the death of the late Mr. John Howard Colls, Past-President of this Association, and a prominent supporter of all the building trade organisations. Sincere sympathy was felt for the members of his family.

Mr. Wm. Shepherd was elected a trustee for the reserve fund, in place of Mr. Colls.

The question of supplying the "Architects' and Builders' Journal" to the ordinary members was discussed, and instructions given of which the members will be notified later.

It was decided to hold the annual dinner at the Whitehall Rooms, Hotel Metropole, on Thursday, February 23rd next, and the annual general meeting at Koh-i-Noor House on Monday, February 27th.

The draft of the annual report was submitted, amended, and approved.

Many matters of interest were discussed.

BUILDERS' FOREMEN'S ASSOCIATION
DINNER.

The seventeenth annual dinner of the above Association was held on Saturday last, January 21st, at the Holborn Restaurant.

The chairman (Mr. G. Parker), proposing the toast of the Association, said that no important building was erected without the builder's foreman, who was more cultured to-day than he had ever been in the past. Turning to the affairs of the Association, the speaker commented upon the absence of papers on architecture by architects, and suggested that such would prove invaluable additions to their series of lectures. The pension fund entitled a member when at the age of sixty to a pension of from 5s. to 8s. per week. Their Association was young, and would, he believed, be much stronger in years to come.

Mr. T. Reynolds (president), responding, urged builders' foremen less than 44 years of age to join the Association. The subscriptions in all amounted only to about 40s. per year. When the pension fund was started in 1903, their capital was about £300.

Mr. G. H. Renton, proposing the toast of "The Building Trades," predicted the time when, in view of fireproof construction, timber merchants would occupy advantageous street corners vending a modicum of timber impregnated with a substance that strikes only on the box.

Mr. Leonard Horner, P.L.M.B.A., in reply, commented upon the change in methods of construction, and recommended the study of reinforced concrete, and the reintroduction of the apprenticeship system.

Mr. A. J. Philcox proposed "The Architects and Surveyors," referring to architecture as "the most honourable and learned profession in the world." Mr. W. Batstone (replying in the absence of Mr. Josiah Gunton) said that the general foreman was inevitably a man who knew his job through and through.

Mr. G. W. Holt, proposing "The Visitors," urged all eligible non-members to join the Association. Mr. Thomas Costigan (secretary, L.M.B.A.) replied, and

made grateful reference to the readiness of the allied trades in coming forward to replenish the funds of charitable institutions.

Mr. Ben Carter then proposed the toast "The Chairman," to which Mr. G. Parker responded, saying that the pension fund would not reach last year's figure; but the total amount to be handed to the treasurer would be £150.

Interspersed with the toasts, an excellent musical programme was rendered.

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

JAN. 30. BRISTOL. HOUSING AND COTTAGE EXHIBITION.—Particulars with respect to the competitions open to architects and builders may be obtained, not later than January 30, from Frank H. Bromhead, A.R.I.B.A., Leaze Cottage, Shirehampton, Bristol, hon. sec. The exhibition is to be held from September 4 to October 7, 1911.

JAN. 31. GLASGOW PUBLIC LIBRARY.—The Corporation invite from architects competitive plans of a branch library proposed to be erected at the corner of Saracen Street and Allander Street, Possilpark. Premiums of £50, £30, and £25 respectively will be awarded to the authors of the designs adjudicated first, second, and third in order of merit. Designs must be lodged on or before Tuesday, January 31. Particulars from A. W. Myles, Town Clerk, City Chambers, Glasgow.

FEB. 1. DUBLIN. NEW PAVILION, ROYAL HOSPITAL FOR INCURABLES AT DONNYBROOK.—Particulars in our issue for October 12.

FEB. 1. SUITE OF OFFICES, HULL.—The Guardians of the Poor for Sculcoates Union offer premiums of ten guineas, six guineas, and four guineas for designs for a suite of offices to be built in Margaret Street, Hull. Apply to J. H. Wild, solicitor, Clerk to the Guardians, 12, Harley Street, Hull.

FEB. 25. COTTAGE HOSPITAL, ST. AUSTELL.—Architects practising in the County of Cornwall are invited to submit designs for a cottage hospital to be erected on the Trewoon Road, in the Town of St. Austell. The estimated cost must not exceed £1,500. Three premiums, viz., £12 12s., £8 8s., and £5 5s., are offered for the three sets of plans which the committee may select, the premium of the finally selected architect to merge into commission. Designs to be sent to the Hon. Secretary, Mr. Henry Hodge, C.C., Trevarrick, St. Austell, by February 25th, 1911.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Premiums of £15 and £10 are offered. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee E. Pearson, Corbridge.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 26.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR CVENTRY.—Premiums of £150, £175, and £125, for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

NEWS ITEMS.

Change of Address.

Messrs. the Middleton Fire Clay Works, of Leeds, have transferred their London offices from 11 and 12, Finsbury Square, to 27, Chancery Lane, W.C.

The Excavation of Caerwent.

So far about one-half of the Roman city of Caerwent, in Monmouthshire, has been laid bare, the excavations having proceeded for upwards of ten years.

£1,500,000 Contract.

Messrs. Pauling and Co., Ltd., Westminster, have secured the contract for the construction of a dam in connection with the Bombay hydro-electric scheme, the total cost of which is estimated to be about a million and a half sterling.

The Royal Sanitary Institute.

His Excellency the Earl of Aberdeen, K.T., has consented to act as patron of the 26th annual congress of the Royal Sanitary Institute, to be held at Belfast from July 24th till 29th next. The Right Hon. Lord Dunleath, D.L., J.P., will be the president of the Congress.

Building Trade Activity in the Transvaal.

His Majesty's Trade Commissioner for South Africa (Mr. R. Sothorn Holland) reports, in connection with the development of the building trade in the Transvaal, that during the three months July to September last seven Transvaal municipalities approved plans of buildings to be erected at an estimated cost of £626,171, an increase of £233,383 over the cost of the buildings authorised in the previous three months.

Carpenters' Company Lectures.

Particulars of a course of lectures on the arts connected with building, announced by the Worshipful Company of Carpenters to be delivered in their Hall, London Wall, on Wednesday evenings, at 7.45, include in the list of lecturers such well-known names as those of Messrs. T. Raffles Davison, Henry Tanner, jun., Laurence A. Turner, Alfred E. Drury, A.R.A., Walter Cave, Arthur Keen, Noel Heaton, W. Bainbridge Reynolds, F. Hamilton

Jackson, and Prof. W. R. Colton, A.R.A. These lectures have been inaugurated by this Company to bridge, as it were, the gulf between their popular lectures and their highly technical ones on carpentry and building construction. The first lecture will be given this evening (January 25th), at 7.45 p.m., by Mr. T. Raffles Davison, the subject being "Truth in Craftsmanship."

New Barracks at Windsor.

The new barracks which have been erected at Windsor at a cost of £56,000, will soon be ready for occupation. The architect is Mr. H. B. Measures, F.R.I.B.A., Director of Barrack Construction. The building is an experiment with the cubicle system, which has long been advocated by many military men of the highest rank. It is replete with every modern convenience, and is greatly superior in comfort to the old barrack quarters.

The Metal Trades in 1910.

Messrs. William Jacks and Co., Metal Merchants, of 4, 5, and 6, East India Avenue, London, E.C., state in their annual report that the past year was an unsatisfactory one for the metal trades, as the production of most metals exceeded the consumption, and the result of the serious strikes in Germany and the United Kingdom brought about a heavy accumulation of stocks which only a trade boom can work off. The table below shows the highest and lowest prices per ton during the past three years:—

	1908.	1909.	1910.
Standard Copper	£65 5s 6d	£64 5s 4d	£62 5s 6d
Foreign Tin	£147 5s 11d	£154 5s 12d	£170 5s 14s

TRADE AND CRAFT.

Sesame Self-opening and Self-closing Doors.

The Easton Lift Company, Express Works, Short Street, Southwark, S.E., announce that they have obtained from the holder the sole right to manufacture Carey's patent Sesame self-opening and self-closing doors. These doors open and close automatically as the person approaches and passes through. They are hung centrally, and work in an arc, edge on, so that it is impossible for any person passing through to get caught or jammed, the doors going away from you whichever way you go through. The automatic opening and closing represent a great convenience for ordinary passing in and out; but the advantage is enormously magnified in the case of hotels and restaurants, where waiters and waitresses with trays are constantly passing to and fro, and in the case of busy shops, where people go in and out burdened with parcels, they save the cost of a commissionaire. The Sesame, moving in an arc edge on, cleaves the air, and, unlike swing doors, does not cause a vacuum, nor does it, like them, vibrate when the wind is blowing. There is not a spring in the mechanism, pure mechanical balance and strength and simplicity of the parts ensuring perfect action and great durability. All the mechanism is under the platform holding the mats, and occupies a space about 8 ins. deep. The doors are supplied in several varieties of wood; and existing doors can be adapted at very little cost.

AN ATTEMPT TO ANALYSE THE TAJ MAHAL.*

BY ROBERT F. CHISHOLM, F.R.I.B.A., F.S.A.

The Taj Mahal, situated on the bank of the River Jumna, a short distance from Agra, is the tomb of Argamand Banu, the favourite wife of Shah Jahan, who constructed it in the year 1631. He himself passed away in 1658, and his remains lie beside those of his queen. The building stands on a platform 18ft. high and 313ft. square, with four minarets at the corners, each 133ft. high. The height of the façade in the centre is nearly 100ft. above the level of the platform, while the apex of the dome rises to nearly twice this height. The interior contains an octagonal cham-

ber in the centre about 50ft. across, with passages leading to four smaller chambers at the angles. The whole of the interior and exterior consists of pure white marble inlaid with agate, bloodstone, jasper, black marble, and lapis-lazuli in that form of Florentine mosaic known as "pietra dura." Perhaps there is no building in the whole world that has received such extravagant praise from travellers, and no building of which pictures, photographs, and models convey so poor an idea, the reason being

Other Buildings that Surpass it.

In regard to its architectural merits, buildings can be found in India surpassing it in every direction; thus, for size and boldness of construction the Taj falls far below the Gol Gombaz at Bijapur. This building covers a square of 135ft. 5in.; Santa Sophia, at Constantinople, covers a square of about 130ft.; St. Peter's, at Rome, about 126ft.; and St. Paul's, London, 95ft. In wealth of intricate detail and great delicacy of finish it is surpassed by the Jain temple at Dilwara, on Mount Abu in Rajputana; in size, unity, and symmetrical arrangement by the great Jumna

it; it is unlike anything I have ever seen." I went and found it was truly, as my friend said, unlike anything I had ever seen. When the view of it burst upon me I saw a translucent visionary object, part of the sun-bathed atmosphere, all-satisfying in its loveliness. For a while I stood gazing in the simple enjoyment of the scene, then, as the sense of keen pleasure gave place to a sense of curiosity, I determined not to move forward one step until I had solved, at all events in part, the secret of this almost unnatural effect, and how it came about.

The Illusion.

First, I observed that all the shadows were in a very high key; the lights on the dark foliage of the cypress trees were deeper than the deepest shadows on the building; again, the windows, which seemed at that distance simple frames,

THE TAJ MAHAL, AGRA, INDIA.

Musjid at Delhi; in constructive skill by the ingenious doming of the mosque of Sher Shah in the old Kila at Delhi; in magnitude and extent by the great Sivite Temple of Madura, South India; and in strict conformity to the canvas of pure architectural decoration by the Muntapum on the building known as Jehanghir's Mahal at Agra and the Bir Bul at Fatchpur Sikri.

I was expressing somewhat similar views to a lady friend who seemed to me to be indulging in rather extravagant praise of the building, when she said, "I understand exactly what you mean, but go and see the building itself. I cannot explain

opened into comparatively light, not dark chambers, while the entrance doorway looked like an ink-blot, seeming to mar the general harmony. I felt convinced that this effect was not intended, and looked for other inharmonious notes. These I soon found in the deep shadows of the subordinate cupolas on the roof. As my eyes became more critical, I detected the comparative coldness of the shadows above the roof as compared with those below; the shade of the great dome was grey, while the shadows of the recesses were of a warm amber colour. Everything above the parapet seemed cold and lifeless, while everything below sparkled

*Abstract from a Paper read before the Indian Section of the Royal Society of Arts, December 15th, 1910.

in the brilliant sunshine, suggesting tones of crimson, citron, green, and orange. Approaching the building, I found it to be in the centre of the large platform of white marble which cannot be seen from the entrance, but the roof, which was doubtless also intended to be of white marble, was covered with that dullest of all dull but useful materials, Portland cement—a deep-toned green-grey! The difference in the effect seems to justify the belief that the roof was intended to throw back on to the dome the maximum amount of reflected light, just as the marble platform on which the building stands throws back the maximum of reflected light on the lower part. The face of this platform, viewed from the gateway, appears to be part of the building, an intentional illusion, I believe, which adds to the general ethereal effect by the weakening of the shadows due to the distance between the foliage and the building.

Window and Door Openings.

Examining the windows more closely, I found that the comparatively light appearance was due to a regular pattern of white marble which acted as a white veil, and could not be perceived at a distance. As cost was no object, I cannot help thinking that if the effect produced was not intentional, the windows would have been filled by elaborate arabesqueing like the screen at Delhi or the Ahmedabad Palm Window. Tracery of this kind would have had a much richer effect, but, of course, it would not have toned the openings to that delicate warm grey. I found also the intensely black spot (the entrance which really opened into the building) to be without a blind or chick, though the two metal rings intended to hold it were in the lintel of the door. Mr. Havell, in his essay on the Taj and its designers, published in the "Nineteenth Century and After," says that this opening was originally closed by silver doors. If this is true, the door-hangings are probably in the frames still; the rings for the hanging of the chicks satisfied me, and I am sorry I did not look further. Again, the four corners of the building are cut off to a considerable extent to avoid the depth produced by simultaneous contrast. Lastly, the effect which would have been produced by mouldings and sunk surfaces in this particular style is here produced by black marble inlay, so that the general appearance is not unlike lace, and at the first glance gives the effect more of a drawing than of a real building. It is difficult to imagine that the attempt to secure the maximum of reflected light, the systematic heightening of all shadows on the façade and dome, the avoidance of strong contrasts, and the provision for planting heavy foliage around and before the building, were all the result of accident rather than the systematic working out of an artistic idea, and still more difficult to understand how, if that idea originated with the architect of the building, it was not carried out consistently to the finish, instead of being stopped at the point where, owing to the deep blue of the zenith, the strongest reflected light would be required. I do not intend by these remarks to disparage the architecture in any way. I am quite ready to admire the proportions and to admit that the Taj would be a remarkable building under any light and constructed of any materials. What I desire to point out is that the startling ethereal appearance is not due to scholastic architecture, and could hardly have originated in an architecturally trained intelligence, for such an intelligence is antagonistic to this principle of subordination, and delights in produc-

ing brilliant contrasts; it is rather an artistic thought, the idea of an artist, a man who loved light and could divide it into a hundred shades. The effect which the building produces on the observer leaves the artist's success beyond a doubt, for the man with the idea has portrayed materially the subtleties of pictorial values, which neither picture nor photograph can fix; in fact, he did for this style of art what Shakespeare did for the drama of his day, and the Taj will always be condemned or exalted in exact proportion to the perception of the idea.

A Glowing Estimate by Sir Frederick Treves.

Dr. Leitner has compared the Taj to a piece of lacework. "It appeared with its dark background of foliage, to float in the air; it was more like a dream than a reality." Bishop Heber said it was the conception of giants carried out by goldsmiths. The late Sir W. W. Hunter described it to me as "a stupendous jewel—not a building at all!" But perhaps the best description is that given by Sir Frederick Treves, one of the most recent travellers. "Everyone," he says, "who visits Argamand Banu's tomb for the first time approaches it with curiosity, tinged probably by a faint disposition to be hostile. So much has been written about this wonderful building, so much rhapsody has been lavished upon it that there is some suspicion of overpraise. The claim that it is the most beautiful building in the world is a claim that many at once resent. Its outlines are familiar enough from pictures and models, and it may be that they hardly warrant unrestricted ecstasy. The visitor proposes to himself to put sentiment aside and review the building critically . . . to submit it to a common-sense inspection, for he is inclined to believe the Taj Mahal to be a much overrated monument. He has, indeed, already imagined himself on his return home, giving to his friends evidence of his originality by asserting that as for the Taj he sees nothing in it . . . With the first sight of the Taj Mahal there comes only a sense of indefinable pleasure; it is no mere feeling of admiration, still less of amazement. No mere delight in a splendid building, because it does not impress one as a building. There is a sudden vision, and with it a sudden sense of ineffable satisfaction, as if in the place of a marble dome the garden had been filled with divine music. All intended criticism is forgotten; there is nothing that appeals to the judgment or that suggests the weighing of opinions. There is merely a something that touches the finest sense of what is tender, beautiful, and lovable—a white cloud, luminous, intangible, translucent! The secret of the beauty of the Taj Mahal lies in the great arched recesses or vaulted alcoves which burrow deep into the body of the building. These are throbbing with sensitive shadows, and they give the impression that the onlooker can see into the very heart of this gentle palace as one would gaze into the heart of a yellow rose, where leaf by leaf the tints become deeper, warmer and more living. There is ever a sense of something half hidden and half revealed of a tenderness which has deeper depths! . . . It is this abiding suggestion which makes the peculiar glory of the Taj a glory which is beyond the reach of any picture or any model. To many the Taj will be the most beautiful building in the world, while there must be few who would not acknowledge that it is the most lovable monument that has ever been erected."

ART AND REGISTRATION.*

BY H. GUICHARDE TODD, F.S.A.Scot, M.S.A.

The future of art in architecture, and the professional welfare of its exponents, are to a great extent in the hands of the present generation, and two policies are put forward for consideration as ameliorations of the present unsatisfactory state of affairs in art and professional practice.

Registration and Copyright.

The registration of architects, as has been proved by several plébiscites, is supported by the great majority of architects, who appear to consider that the reorganisation of the profession is necessary; and architectural copyright is brought forward by a section which professes to study more particularly the future of our art while protecting the interests of professional men. These policies may appear, at first sight, to be very similar, and leading towards the same end, but a closer study of their probable effects in practice, and more particularly on art, is worthy of the consideration of this society, especially as its members are probably the very men who will in the next generation have to practise under one or other of these policies, and maybe regulate their administration.

Sir James Mackintosh, the eminent lawyer and essayist of the earlier portion of the last century, said, "The description of liberty which seems to be the most comprehensive is that of security against wrong. Liberty is therefore the object of all government." The registration of architects means the ultimate government of the profession by the profession to ensure security against wrong, but it is not only in the personal protection of the members of the profession that the policy of Registration is worthy of consideration, and the probable effects of such a policy on art must be studied.

The Effect of Art.

Art in architecture is acknowledged by the majority of our most prominent architects to be in a very unsatisfactory state, and the introduction of an Architectural Copyright Bill at first sight appears to be a necessary measure for the protection of the personal property and standing of the architects. The author, however, shows, later in his paper, that he has no belief in its efficacy or its necessity.

The registration of architects would not necessarily make every building in our streets a work of art, but it would undoubtedly, in future years, prevent the utterly unqualified and ignorant man from practising as an architect.

Convincing the Public.

Architects may not advertise for their own personal benefit, but architects as a body can surely advertise the importance of their art by drawing public attention to it on every possible occasion. The Town Planning Conference has done much to convince the public of the importance of the architectural profession; but it must be remembered that the subject of Town Planning owes its present prominence very largely to the fact that it has been brought to the public notice through political channels, the Town Planning Bill having been commented on by every journal of importance, and the subject having all the prominence of a political measure. It is obvious that the introduction of a Bill for the Registration of Architects would also attract notice and convince a large proportion of the general public of the importance of the architectural profession.

*Substance of a paper read to the Guild of Architects' Assistants on January 10th.

In the medical profession the Diploma of Public Health (D.P.H.) held by so many doctors has convinced the public that public health is made a serious study by medical men; the profession is looked up to, and the public interests in that sphere are felt to be safe in its hands. The institution of a diploma in civil architecture might well fill a corresponding place in the architectural profession, and have the same effect, in convincing the

public that architects are solicitous for their well-being by endeavouring to give them artistic and suitable as well as sanitary and well-built buildings, but such a diploma could be of little use so long as the professions of stockbroking and architecture are interchangeable.

Public approbation is necessary to the progress of art, but the public cannot be forced to appreciate art and architecture. Therefore, it must be led to that apprecia-

tion; and the first step likely to convince at least a large section of the public of the importance of architecture would be the initiation of the policy of Registration, and the consequent access of dignity and standing in the public eye which that measure would confer on the members of the profession.

Gilbertian Position.

It is amusing to find that the first great proposal for many years, professedly in

ENTRANCE TO THE CROSS BATH, BATH: A FINE EXAMPLE OF EIGHTEENTH-CENTURY ARCHITECTURE
BY THOMAS BALDWIN (C. 1790.)

the interests of architects, should be so obviously in the interests of the legal profession, and such a Gilbertian position can only bring ridicule on architects, and give the public cause to believe that architects cannot manage their own affairs. Under Registration, the names of practitioners guilty of the malpractice of unjustifiably copying plans of elevations to the detriment of their professional brethren could be removed from the Registration list, and this action would be a parallel to being struck off the rolls in the legal and medical professions. Lawyers and medical men have wisely kept the management of their own affairs in their own hands, and it cannot be said that it presses unfairly on the members of these professions, as only in the case of aggravated malpractice is the power of ejection exercised.

Gilbertian Proposal.

As architects can be the only judges of what constitutes infringement of architectural design, the elevation of some eminent architect to the Bench to deal with all cases under the Architectural Copyright Act would appear to be necessary, in conjunction with an arrangement whereby architects might take silk and plead at the Architectural Bar on matters of Art. This may appear to be purely fantastic, but, given an Architectural Copyright Bill to protect originality in Art in Architecture, it appears to be a logical necessity.

An Architectural Copyright Bill in conjunction with an Architects' Registration Bill is more attractive, but Architectural Copyright under existing conditions does not appear to be in the best interests of architectural progress. Registration, on the other hand, would appear to tend towards architectural progress.

Education and Ideals.

True originality in architecture must always be a fresh and rational interpretation of structural truths and proportions, and can only be the outcome of the study of those truths and principles, and any sudden and violent demarcation from these axioms of building, or their rational developments, shows the untutored and uneducated architect.

Architecture has great ideals, and the only logical method of attaining those ideals is through the medium of well-applied study; yet, under present conditions, it is possible for any person to practise as an architect without study or training of any kind, and leave vulgar fripperies as heritages and a reflex of the architectural art of this present generation.

The Registration of architects, by binding the members of the profession together, by enforcing a statutory qualification, by emphasising the necessity for the study of

architecture as an art, and through the power it would have as a united and definite profession, able to speak with one voice, could only have the effect of furthering this ideal of carrying our tradition forward and proving to future critics that this generation was solicitous for the well-being of that art which is undoubtedly the truest index to the culture or civilization of any age. Registration is not an ideal policy; but the necessities of the case are such that there appears to be no alternative.

Italy, Spain, Russia, several of the United States of America, the Transvaal, and some of the Canadian Provinces have successfully adopted Registration, while Germany and Hungary compel all public architectural officials to have a Government Diploma, and from none of these countries do we hear that the spirit of design in architecture has died in consequence.

Registration stands for statutory qualification, which depends upon architectural education, and architectural education, in whatever light we view it, must appear the most important subject that can engage the attention of the architect, and it is most important that he should now support the policy of Registration if he wishes architects to control the necessary qualifying examinations.

The progress of art depends upon public support, and the public is always impressed by strength. It has been said, "If massive columns are close to each other, they appear more massive still; and slender columns, when wide apart, appear slenderer still." It is surely easy and natural for architects to apply this architectural maxim to their professional affairs. Every architect is a column in the structure of the profession, and if architects bind themselves together under Registration, in the interests of their art, as well as in the public interest, the tendency will be for the public to respond by showing appreciation of architectural refinement and excellence, and condemning the vulgar and inartistic.

HOUSE AT MOOR GREEN, BIRMINGHAM.

This house, built from designs by Messrs. Buckland and Haywood-Farmer, of Birmingham, is a quiet example of English domestic work, free from affectation or eccentricity. It is built of red bricks, and roofed with tiles. The following is the list of rooms, numbered on the plans below:—Ground floor: 1, drawing-room; 2, study; 3, pantry; 4, kitchen; 5, yard; 6, hall; 10, coal; 11, dining-room; 12, servants' room; 13, motor-house; 14, lavatory. First floor: 16, bedrooms; 19, bathroom; 20, dressing-room.

Ground-floor Plan.

First-floor Plan.

HOUSE AT MOOR GREEN, MOSELEY, NEAR BIRMINGHAM

THE CEMENT INDUSTRY IN GERMANY.

H.M. Consul-General at Hamburg (Sir W. Ward), writing with reference to the cement industry of Germany, says that in the autumn of 1909 the German cement factories came to an agreement to raise the minimum prices of cement for export; but this agreement lasted for only a very short period, and export prices sank to their former level as soon as it became evident that the negotiations of the German groups with regard to the home trade would not lead to a satisfactory conclusion. In November, 1909, several of the German groups were dissolved, and this is said to have been the cause of much excited competition in Berlin. Large contracts were then made at prices equal to the cost of production. The Berlin group and the central German Union of Cement Factories were unable to agree, owing to the exorbitant demands of the newly founded factories.

These circumstances, combined with the competition of Belgian cement in Westphalia and in the Rhine Province, led to a general reduction of prices. Then came the general strike in the building industry in the summer of last year, and the results revealed by the reports of those works which closed their balances in June were far from satisfactory. On the other hand, the export business has been brisk, especially during the last few months; but this activity has not been sufficient to relieve the factories of the large stocks which had accumulated, more especially in central Germany.

In spite of this unfavourable state of the industry, the number of new factories has still further increased, a circumstance which for a long time deferred the realisation of an agreement among the German groups. After protracted negotiations an agreement was reached in November; but a considerable number of the factories have not accepted it.

The prospects for the year 1911 are not considered as encouraging, and the only favourable feature in the situation is thought to be that little money is available for the establishment of further new undertakings. The demand for cement, however, remains large, and is probably increasing, and as the cement trade abroad is also improving, it is hoped in Germany that an improvement may be anticipated towards the end of 1911.

[The value of such consular reports as the foregoing is unquestionable; and in time, as such reports become more regular and systematic, they must result in considerable all-round benefit to commerce and industry.]

Garden Front.

Entrance Front.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editors desire to give notice that answers to the following enquiries can no longer be undertaken:—

- (1) Enquiries about buildings to measure in particular towns and districts.
- (2) Enquiries embodying questions which have been set in examination papers.
- (3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Open Joisted Floor.

H. E. C. (LONDON) writes: "In building a small country house it is desired to show the first floor joists as beams in the ceilings below. Do you think that an arrangement as shown in sketch would be suitable and satisfactory, having in view the desirability of rapid and economical construction?"

—The method of construction suggested should prove satisfactory, though it hardly seems necessary to use zin. partition slabs, as the makers of the "Mack" partitions also produce a thinner ceiling-slab, toughened with cocoanut fibre, which will be much lighter and equally efficacious.

A: IDEAL FLOORING LAID FOLDING WITH SPAYED HEADINGS
B: 7"x24" DEAL JOISTS
C: JOINTS POINTED IN LINE AND PAIR
D: 2" MACK PLASTER PARTITION SLABS HEAD-
ING JOINTS POINTED IN KEEN'S CEMENT
AND DISTEMPERED ON UNDERSIDE
E: 1"x1" DEAL FILLETS PLANTED ON JOISTS

cious. Uralite sheets have also been used. The conduction of sound, however, is the chief objection to these open joist floors, and strips of carpet felt, deafening quilt, or similar substance laid between the joists and the flooring above effect an improvement in this respect. The appearance of the ceiling may be improved at slight extra cost by using moulded fillets instead of 1in. x 1in. square.

G.

Erecting Walls to Prevent Overlooking.

"NEIGHBOUR" writes: "A buys a piece of land and builds a house. B buys the next piece and builds two houses. A is annoyed and has built a 14 in. wall 16ft. high to prevent B from overlooking his lawn, garden, and yard. A now wants to erect something 16 ft. high falling to 5ft. to prevent B from overlooking him in the front. Is it possible to build a concrete wall, say, 6 in. wide, for this height?"

—Surely A is a little unreasonable, and will be in a worse position after he has built this awful wall than he now is? He will decrease the light to his own front windows as well as build a monstrosity for his own future contemplation. Would it not be better to plant some tall evergreen shrubs to mitigate any nuisance there may now possibly be? I suggest *Thuja Lobbii* as a suitable shrub to plant about 4 feet apart to grow together into a close hedge; at 5 ft. high good plants will cost 24s. a dozen, and at 7 feet in height they only amount to about 40s. per dozen. If A is determined to build the wall he can hardly do better than construct it of reinforced concrete—a

material which can be safely built to a much greater height with a total thickness of less than six inches. Before building it, however, I strongly advise A to consult his title deeds in order to find out whether there is not some restriction as to erections in front of his building line which would prevent an obstruction such as is now suggested. I also advise him to find out whether B's windows have been in existence more than 19 years (if so the "Prescription Act, 1883," probably prevents the erection of this wall); and, further, he must remember (if his house is in an Urban District) that the Local Sanitary Authority have powers under the "Public Health Act, 1888," with regard to buildings in advance of the existing buildings in a street. F.S.I.

Objectionable Board on Boundary Line.

"ANSELL" writes: "Kindly give me your opinion on the following: (1) B is owner of house and has broken out a window, glazed with leaded lights, which looks on to the space left between B's house and A's house when he builds. Directly after, A put up a board exactly on B's boundary; can A do this? Is B entitled to look upon half of the space between, or the full space that the Estate insists must be left between the two properties? (2) When A builds, what about his right of light looking on to B's property? (3) Usually it is understood that B should have built 1½ yards from his building line, and A would have to do the same, but the Estate allowed B to build right up to his building line, therefore A will have to leave the 3 yards."

—You would do well to look up the "Building Regulations" and "Sale Conditions" under which you purchased your plot of land—it is very usual to insert in such documents a stipulation that no right of light shall arise out of the development of the property which is being cut up into building plots.

I am of opinion (1) that A is quite within his rights in erecting the board which B finds ugly, and no doubt objectionable—he has put it up upon his own property and B cannot object. Personally I always prefer to accept a small acknowledgment rental in such a case as this, but one cannot be compelled to take that course.

(2) A will be in precisely the same position when he builds his house, as B now is placed, and it will be competent for B to prevent the acquisition of a right of light by erecting a screen upon his own property if he so chooses.

(3) I do not see how the side building lines affect this question, but I must express some doubt as to whether the action of the vendors of the original Estate in allowing one purchaser to infringe the regulations can bind another purchaser. F.S.I.

Defective Church Acoustics.

"SONOROUS" writes: "Complaints are made about the acoustic properties of a recently erected church. (1) Is the introduction of wires across the springing of the roof of much value? What kind of wire, and what gauge should be used, and at what intervals? Is there any better method of treatment? (2) What is the best form of sound board to use above the pulpit?"

—The smallest effective circular sound-board would probably be one forming the base of a cone with an apex of 30 degrees at the speaker's head, the height being

6 to 10ft., according to local circumstances. Wires across the springing of the roof have frequently proved effective for breaking up echoes. They should be of galvanised steel if gas is used, but may be of hard brass if electric light is used, say about No. 16 to 18 gauge (S.W.G.), with a sag in the centre of 3 to 6in. It is impossible to have the wires perfectly horizontal, and the less sag the greater strain. They are generally placed from 3 to 6ft. apart, but until the principles of acoustics are fully understood all such work is in the way of experiment.

HENRY ADAMS.

River Landing Cut Through Retaining Wall.

H. S. writes: "The attached tracing [not reproduced] shows proposed new landing stairs from river to be cut through an existing wall; also the proposed concrete retaining walls for earth and water. Are the proposed retaining walls of sufficient thickness and good design? If not, a sketch cross section showing a wall suitable for the purpose will be appreciated."

—A retaining wall with vertical face and set-offs at the back is the least economical section, as the centre of gravity is thrown forward to the face, and the leverage for

FIG 1

FIG 2

stability is reduced. The new walls should be bonded into the existing wall, and if an arched strut were thrown across the passage-way they would be greatly strengthened. The arch might be 2 ft. wide and 2 ft. deep at the centre, 2 ft. back from junction with existing wall, 18 ins. rise (as in Fig. 1), and filled level on top with saddle-back. It should be put in at the same time as the walls to form a homogeneous structure. The granite steps should be built in $4\frac{1}{2}$ ins. at each end, so as not to depend upon the earth filling for their support. The stability of the new wall, apart from the strut, is shown graphically in Fig. 2. The calculations are as follows:—At A,

$$\frac{W}{A} \pm \frac{M}{Z} = \frac{13.6}{2} \pm \frac{13.6 \times \frac{1}{8}}{\frac{1}{8}(1 \times 2^2)} = 6.8 \pm 3.4 = 10.2 \text{ cwt.}$$

per sq. ft. compression, and 3.4 cwt. per sq. ft. compression. At B,

$$\frac{W}{A} \pm \frac{M}{Z} = \frac{23.5}{2.5} \pm \frac{23.5 \times \frac{3}{8}}{\frac{1}{8}(1 \times 2.5^2)} = 9.4 \pm 15 = 24.4$$

cwt. per sq. ft. compression, and 5.6 cwt. per sq. ft. tension. At C,

$$\frac{W}{A} \pm \frac{M}{Z} = \frac{43}{3.25} \pm \frac{43 \times 1\frac{1}{2}}{\frac{1}{8}(1 \times 3.25^2)} = 13.2 \pm 36.6$$

= 49.8 cwt. per sq. ft. compression and 23.4 cwt. per sq. ft. tension. The only serious stress is the last item, where a tension of 23.4 cwt. per sq. ft. is shown on the inner edge at the top of the set-off, but good concrete ought to stand this.

HENRY ADAMS.

Architects' Assistants Under Government.

"EXPERIENCE" writes: "Please give a list of Government appointments open to architects' assistants, and any other available information, or state where particulars may be obtained."

—This question has been frequently answered in the past, and we must ask readers who desire such information in the future to refer back to previous issues.

The number of architects in the service of the Government is quite small. They are employed chiefly in connection with the Office of Works, Admiralty, War Office, Post Office, Local Government Board, Board of Education, and Home Office. The openings for architects' assistants are not of frequent occurrence; but the Civil Service Commissioners, Burlington Gardens, W., would probably be able to give full information with respect to these posts.

Seaside House Cesspool.

"INTERESTED" writes: "I am about to take a house at the seaside, attached to which is a cesspool 125 ft. away in clayey marl, 1,750 ft. from the sea shore, where the land forms a vertical face 80 ft. high. The cesspool is constructed of 9 in. brickwork built dry, with vertical joints open $\frac{1}{2}$ in. for a height of 6 ft. 9 in. from the bottom, and the upper part in cement mortar with a backing of clay puddle 12 in. thick. The pit is 7 ft. diameter by 15 ft. deep, with three rows of agricultural pipes 30 ft. in length each and 6 in. diameter, spread at 120 deg. apart horizontally, and attached to the dry brickwork to assist the soak away."

"The pit is sealed in at the top, has a ventilating pipe at the side furthest away from the house, and a fresh air inlet on opposite side. The 6 in. house drain is disconnected from the cesspit by means of a reverse action interceptor with air inlet. The drains connecting to the house are of the very best class, with gullies, inspection chambers, traps, etc. Up to the present the whole system has been used for foul water drainage only—now a w.c. and a bath have been placed in

the house and connected up to the system. I should like to know whether this arrangement will be perfectly safe."

—If the soil has proved to be of a sufficiently porous nature to allow the soakage from the cesspool to pass away, it is probable that it will continue to do so, but any such arrangement for the disposal of unpurified sewage is generally considered unscientific and dangerous. Septic action will undoubtedly take place in the cesspool, but only the preliminary stage brought about by anaerobic bacteria, which break up the solid organic substances contained in the sewage but leave an effluent of turbid character. To complete the purification the addition of a filter is requisite. If the inlet to the cesspool is above the usual level of its liquid contents the septic action will be interfered with by the splashing of sewage breaking up the scum in which the colonies of bacteria work, but this may be avoided by prolonging the inlet inside the cesspool to discharge below the water level.

As to the likelihood of foul air and vapours being drawn up into the house from the soil, the cesspool is sufficiently distant to render this improbable, but liquids will always flow in the direction of least resistance, and there is at least the risk that some circumstance in the arrangement of strata may direct them towards the house. If by any means a fall of about five feet can be obtained, and there is either space on the site for surface distribution or means of getting rid of the purified effluent into some water-course or the sea, a simple disposal system such as Farrer's septic cesspool and filter or Adamsez "non-septic system" would be the best treatment; but if this is impossible and a watertight cesspool must be adopted, this should be of brickwork rendered internally in cement or asphalted and surrounded by clay puddle; of sufficient capacity to hold on a liberal estimate 3 months' flow. The arrangements for ventilation described appear satisfactory, but periodical emptying would be required, and a float and indicator to give notice of the need. A pump for raising the contents is desirable. G.

Truss for 60ft. Span.

"DESIGNER" writes: "Please give your opinion with respect to the stability of a roof of which line diagram is enclosed [not reproduced]. I do not think it sufficiently rigid, as it is liable to buckle unless it has very large connections. Assuming 20lb. per sq. ft. on incline for slates and steel purlins, and 30lb. per sq. ft. for wind, there will be a load of 5.5 tons on an unsupported length of 18ft. of truss back. As this member is only a 7in. by 4in. R.S. joist, I think the deflection will be too great."

—The roof truss submitted, having only two bays in each rafter, is not suitable for so large a span as 60ft., especially as the purlins are distributed along the rafters between the points of support. In "The Practical Designing of Structural Ironwork" (Spon, 8s. 6d.) a detail design and calculations are given for a roof truss, besides much other useful matter. Many types of roof trusses are shown that would be suitable up to 60ft. span, but all have four bays in each rafter.

HENRY ADAMS.

Roof Truss Diagram.

W. (HARROGATE) writes: "Kindly advise with respect to enclosed $\frac{1}{2}$ in. detail of a roof truss and frame diagram of same [not reproduced]. I find it difficult to set

up the stress diagram, and I should be much obliged if you would tell me how this should be done, as I am anxious to find out if the sizes of the timbers given are strong enough."

—The design submitted shows a very imperfect type of truss. There must be a king-bolt or strap in the centre before any stress diagram can be drawn. The lower angle braces are of no value except for giving a bearing surface for the load, which might be equally well taken by the principal rafters if the feet are properly cut and supported. The weak part will be under the lower purlins, where the central bracing joins the principal rafters. The stress there will be such as to require a section about 15 in. by 12 in. for the principal rafter, unless there is an additional brace put across the joint strengthened by a substantial steel plate along the underside to connect the various parts.

HENRY ADAMS.

Sewage Purification for Private House.

L. P. (NEWPORT) writes: "Will you please give me your expert advice on the construction of a septic tank as shown on the enclosed tracing [not reproduced], and your opinion of its efficiency, and whether perfectly satisfactory results would be obtained? It is proposed to be used for a house with an average number of six inmates. Two w.c.'s, two lavatory basins, one bath and one sink would flow into the tank, and rainwater drains would not be connected to it. Would filter No. 1 be entirely free from smell?"

—The purification of sewage is not yet an exact science, and perfect results cannot be hoped for unless the installation is designed by an engineer fully acquainted with that branch of his profession, after an inspection of the site and careful consideration of the numerous local factors which will affect his decision as to the best method to adopt.

The design submitted will certainly not prove satisfactory. The septic tank will be more efficient if made 5ft. long and 3ft. wide. If the cover is placed adjoining one of the walls instead of over the centre of the tank it will facilitate entry if desired at any time. Filter No. 1 would merely act as a mechanical strainer, and when first installed would doubtless be effective in retaining a large proportion of the finely divided solid matters in suspension, but it would soon become choked up and could not easily be cleaned. It would probably always smell very badly, and in an installation of this character it is better to omit any provision of the sort and to allow the septicised sewage to flow direct to the aerating filters. The proposed method of distributing the sewage on the filters would result in the whole of the sewage being applied on the very small area immediately under the perforated pipes, consequently the filter would be choked up and thus become inoperative. To distribute the sewage evenly over the whole area, a Stoddart's distributor, consisting of a perforated tray with drip points under, might be employed, provided that the plant is not yet to be situated in a position where the exposure of the highly smelling septic tank effluent on the tray might prove a nuisance. An alternative would be to fix a tipping trough which would, when full, tip over and eject the sewage along "ladders" whereby it would be applied more or less evenly over the surface of the filter.

The 2in. dia. vertical pipes are apparently intended to act as ventilators, but in order to be effective they must be lengthened so as to connect the under drains with the open air. The perforated draining tiles on the floor of the filter should be laid close together so as to cover the whole area and permit an adequate supply of fresh air to the underside of the filter; or in the alternative a false floor should be constructed, giving about 2in. air space.

The proposed depth of 2ft. 6in. for the filtering medium is not sufficient; it must

be increased to at least 4ft. or 4ft. 6in. The quantity of filtering medium required will depend upon the degree of purity required in the effluent, which in turn depends to some extent upon where it is proposed to be discharged. The size shown, 7ft. by 4ft., will probably do if the filter is made 4ft. deep, although 4ft. 6in. would be better. From a structural point of view, the proposed details of construction will be satisfactory.

HENRY C. ADAMS.

Stress Diagram for Roof Truss: Green Deposit on Brick Walls: Reliable Roof Covering.

X. (LONDON) writes: "I shall be much obliged if you will kindly answer the following questions: (1) What is the correct way of drawing the stress diagram for the lantern of the roof truss—as enclosed diagram [not reproduced]—so as to determine the reactions at the points 3-4 7-8, caused by the weight of the lantern? I have drawn out the diagram several times, but find it impossible—with the loads taken, and which I wish to retain—to make the point 26 in the stress diagram fall on the line 4-7. Assuming a line somewhat as 4-7 to be correct, the rest of the diagram works out with little trouble.

"(2). In the swimming hall of some public baths recently built a green removable deposit forms in places on the red brick walls above the glazed brick dado. Do you think that two coats of washable distemper would remedy this?

"(3). Could you let me know some of the cheapest reliable forms of external roof covering for a hall, pitch 25 deg.? Appearance is of secondary importance, as the roof is not visible from a main road."

—(1). Querist has drawn one of his loads to the wrong scale, and thus has been unable to make the diagram close properly; he has also taken the weight of the vertical side of lantern as acting at the top instead of the bottom. The frame diagram of lantern light will be as Fig. 1, and the stress diagram as Fig. 2, giving the two reactions and stresses in the upper portions of the principal rafters. The frame diagram of main truss will be as in Fig. 3, and it will be seen that the reactions from the lantern are taken as loads on the main truss. The stress diagram, Fig. 4 may be easily worked out, using a sub-

stituted member a-b to find point 19, and the stresses found in the upper part of principal rafters must be added to those produced by the weight and wind on the lantern light as previously found. This is the best method to adopt in the case of a complicated truss, but in a simple truss such as this the stress diagram may be worked direct from the complete frame diagram as shown in Figs. 5 and 6.

(2). The "green removable deposit" on the red brick walls of the swimming hall appears likely to be a growth of moss due to damp brickwork in a warm moist atmosphere. Silicate of soda would probably be more effective as a wash than distemper, but the writer has had no experience of it for this purpose.

(3). It depends upon what is understood by reliable, and whether the roof covering is for a temporary or permanent building. Useful information might be obtained from firms manufacturing or selling Willesden roofing, Ruberoid, Vulcanite, Jodelite, Uralite, etc.

HENRY ADAMS.

Strength of Roof.

AMATEUR (CARNARVONSHIRE) writes: "I should be obliged if you would kindly give your advice re enclosed sketch of roof [not reproduced]. The proportions of the rooms are not happy, and the height cannot be increased. I feel that an ordinary principal in the middle of the room would not look very well. I suggest a roof formed as sketch, every rafter forming a rough principal, and plastered on the soffit. I should like to have your opinion on the strength of same, and as to the thickness of the walls. Could the scantlings be safely reduced?"

—The proposed scantlings and framing of roof will be just sufficient if the building is not in an exceptionally exposed position. If it is, the rafters should be increased to 8in. by 2in., or 7in. by 2½in. The walls cannot be reduced in thickness.

HENRY ADAMS.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

The annual dinner of the Leeds and Yorkshire Architectural Society was held at the Queen's Hotel, Leeds, on January 12th. The chair was taken by the President (Mr. S. D. Kitson), who was supported by Lord Airedale, Mr. E. Guy Dawber (vice-president of the Royal Institute of British Architects), the Lord Mayor of Leeds (Mr. W. Middlebrook, M.P.), Mr. Rowland Barran, M.P., Sir Nathan Bodington, Mr. P. Worthington (president of the Manchester Society of Architects), and others.

Lord Airedale submitted "The Royal Institute of British Architects." He was glad, he said, to see such beautiful examples of street architecture as could now be seen in Infirmary Street, East Parade, and Park Row, which were meeting the necessities of a great and smoky town.

Mr. E. Guy Dawber, V.P.R.I.B.A., replying to the toast, said they must educate their young men up to the highest possible pitch of attainment. The recent Town-Planning Exhibition organised by the Institute showed to the people who had never before realised that architecture was of any use, that good architecture, open spaces, and broad streets not only added to the health and comfort of the people, but were a national asset. Mr. John Burns truly said, "Mean streets make a mean man." The people who were brought up in dismal rows of dreary houses must have a dismal and dreary outlook on life.

Mr. H. S. Chorley proposed "The City of Leeds." He believed, he said, the bonds which united the Corporation with the architects of the city would be strengthened by the recent Town-Planning Act. With regard to the state of the city, people hardly realised the difficulties that confronted the immediate predecessors of the present generation. Seventy years ago Leeds was only a small town, and the rulers of that day were probably not capable of coping with the mushroom growth which they had not anticipated.

The Lord Mayor, in reply, said theirs was a profession which combined in an especial degree the practical and the artistic. With regard to smoke, he said that smoke generally meant prosperity, and that prosperity would lead to a greater and deeper culture, which would give greater opportunities to the architects. He trusted that the commercial prosperity upon which they were now entering would make itself felt in the architectural profession.

Sir Nathan Bodington submitted the toast of "The Leeds and Yorkshire Architectural Society." Architecture had the great advantage, he said, that it was the most democratic of all the arts. If the democracy was ever going to take art home to itself in any serious sense, it would be in the form of architecture. Painting was the art of an age in which the wealthy were the patrons. Music was essentially the art of the middle classes, but architecture, which Goethe called dumb music, gave harmonies in stone or other material which were rendered permanent, were erected generally on the larger scale at the public cost, and were there for all, rich or poor, educated and uneducated, to see and enjoy. In that town planning to which so much reference had been made it seemed to him that we already saw a promise of a better future. If that were to be so, they needed the help of the architectural profession.

The President, in responding, said that the Corporation of Leeds had anticipated the Town-Planning Act, and had been engaged in a stupendous work in the unhealthy areas, and had done it in a most wonderful way. With regard to smoke, he said they looked to the enormous development of electric power to clear the atmosphere of the big manufacturing towns.

Lord Airedale interposed a further remark on smoke production. The number of houses in Leeds, he said, was close on 100,000, and it was calculated that the weekly consumption of coal would average 4cwt. per house per week. So that the houses of Leeds were consuming 20,000 tons of coal per week, whilst at their works they consumed only 1,000 tons. It was in the houses that the great nuisance was developed. Therefore, it was entirely the fault of the architects. There were means by which the production of household smoke could be materially reduced.

Mr. J. S. R. Phillips, responding to the toast of "The Guests," which had been proposed by Mr. W. H. Thorpe, suggested amongst forthcoming work for the architects a new house for the Lord Mayor, whose present rooms were inadequate to the dignity of the position. With regard to the point that architecture was a democratic art, Mr. Phillips said the beautiful architecture of the Continent was due rather to despots and tyrants than to any public bodies. He referred to the absence, from the speeches that evening, of any mention of the Copyright Bill which would come before the new Parliament, and he criticised some of its provisions as to architecture.

BUILDING INTERESTS IN THE
NEW PARLIAMENT.*Building By-laws, etc.*

The Corporations of Gloucester, Belfast, Halifax, Rotherham, Luton, and St. Helens, and the Hebburn Urban District Council, each seek to lay down what shall be the minimum area for habitable rooms. In the case of Gloucester, Northampton, Halifax, and Rotherham, the clause reads: "Every new dwelling-house shall be provided with at least one living-room with a floor area of not less than 115 square feet, and one bedroom with a floor area of not less than 110 square feet; and no bedroom or other habitable room shall have less floor area than 70 square feet." Luton and Hebburn each ask that no other habitable room shall have a less floor space than 90 square feet; whilst St. Helens asks for one living room of 132 square feet, one bedroom of 110 square feet, and other rooms of not less than 70 square feet. Several authorities, including Gloucester, Newcastle-on-Tyne, Coventry, Luton, and Belfast, have provisions dealing with iron, steel, or reinforced concrete buildings. They provide for persons desirous of erecting such buildings making application to the corporation and sending complete plans, and the Corporation may issue such general rules as they think necessary.

Street Works.

The Luton Corporation has an ambitious programme for further improving the town, and asks for authority to spend £55,000 on the erection of a town hall and municipal offices, £12,000 on public baths, and £3,500 on improving and extending the market. The Hebburn District Council wish to construct a new street, and to widen School Street, at an estimated cost of £3,300. Rotherham Corporation have submitted an estimate of £149,650 for land and street works, £10,000 for the construction of a public hall, £34,000 for permanent street paving, and £5,000 for the enlargement of the dust destructor. Northampton Corporation also contemplate the widening of Bridge Street, South Bridge, and Cotter End, at an estimated cost of £70,000. For the purchase of land and construction of street works the Halifax Corporation ask for £48,560. The Port of London Authority seek to acquire compulsorily certain houses and premises in Savage Gardens, Trinity Square, and Muscovy Court in the City of London, including the premises known as Muscovy House, so as to enable them to erect offices, etc. The proposed scheme involves the stopping up of Muscovy Court. The Hornsea Urban District Council ask for authority to enclose the promenade gardens and to make arrangements for meeting the cost of sea defence works. Amongst the proposals of the Chiswick Urban District Council is one for the construction of an embankment to make a promenade along the Thames, for which £34,500 will be required, whilst a sum of £16,000 is set down for street improvements. The Aberdare Urban District Council ask to spend £4,000 on street improvements, £9,500 on bridge works, £14,500 on public libraries, £4,700 on recreation grounds, and £3,000 on a dust destructor. Coventry Corporation contemplate a big improvement which includes the widening of Leicester Street and the making of a new street. The whole scheme is estimated to cost £160,000. Hull, amongst other things, wants to spend £22,000 on the construction of tramway buildings, and Belfast £119,000 on flood prevention works and £156,000 on street works.

Town Planning.

The London County Council, in their General Powers Bill, have a most important measure, inasmuch as they seek powers to develop and use or let on lease for the purpose of development on the lines of a garden suburb any portion or portions of the White Hart Lane Estate. It will be remembered that a considerable time ago the London County Council purchased a big tract of land at Tottenham for housing persons of the working class, but a good deal of the estate has not been developed. Provisions are included in the Bill exempting from any local by-laws or provisions in force in the area the buildings and roads on that part of the estate which may be developed as a garden suburb. Power is also included to enable the Council to provide gardens, recreation grounds, buildings and facilities and apparatus for games for the use of the inhabitants of any dwellings on the estate, and to make charges for the use thereof. Part 10 of the Bill promoted by the Newcastle-on-Tyne Corporation deals with streets and buildings and provides for "garden streets" by allowing for narrower streets than the regulation width where the houses are built back in gardens. In Part III. of the Coventry Corporation Bill it is laid down that any new main thoroughfare shall be of a minimum width of 80 feet.

Other Municipal Proposals.

The London County Council are also seeking power to control and regulate any movable erection extending beyond the general line of buildings in any street to which the consent of the Council would be required in pursuance of Section 22 of the Act of 1894 if such erection had been fixed and not movable; or (subject to certain exceptions and limitations) any pulley, crane, loading flap, awning, screen, blind, lamp, daylight reflector or prismatic light, clock, sign or device, case, stall or other fittings for the display of articles extending beyond the general line, or overhanging the public way. The City Corporation is also asking for practically similar powers within its area. The London County Council further seek extension of time for the construction of the Thames Embankment extension and the improvements at Westminster, and ask for power to provide sanitary conveniences, street refuges, etc., on the Victoria Embankment. Hull Corporation want to construct a landing stage and pier in the River Humber at an estimated cost of £40,000, and Belfast Corporation to extend the cemetery at a cost of £22,000. The Woking Urban District Council wish to combine with other authorities in improving the bridges and public ways in connection with the Basingstoke Canal, which apparently has fallen into a bad way. It is proposed by the Widnes and Runcorn Bridge Bill to transfer that bridge to the Widnes Corporation, who will strengthen and improve it, and a further proposal is to vest Kingston-on-Thames Bridge in the County Councils of Surrey and Middlesex, and to spend over £100,000 in widening the bridge and approach roads. By far the most important bridge proposal is, of course, that of the City of London Corporation for the construction of St Paul's Bridge.

Sewage Matters.

Several important sewerage schemes are proposed, and the Manchester Corporation ask to construct new main sewers at a cost of £1,000,000. By the Eastern Valley of Monmouthshire Sewerage Board Bill it is suggested that a joint board of six local authorities be formed and that £85,000 be expended on sewerage works. The Western

Valley (Monmouthshire) Sewerage Board, an existing authority, want to spend an additional £30,000 on works and land; whilst the Metropolitan Water Board is bringing in a Bill to relieve itself of the duty of dealing with the sewage of Hertford, which duty will revert to the local authority. By the Afon Lwyd Valley Sewerage Bill it is sought to constitute a joint sewerage Board for seven local authorities, including Pontypool, and to spend £118,000 on sewerage works. Failing the introduction of a Government Bill dealing with sewers, the local authorities seem to have taken the matter into their own hands for no fewer than 24 Corporations and Urban District Councils, including Canterbury, Stoke-on-Trent, Dover, Grantham, Lowestoft, and Maidstone, have combined together and brought in a Bill to settle, so far as their respective districts are concerned, the vexed question of what is a drain and what is a sewer.

Waterworks.

There are, as usual, a fair number of water Bills, of which the most interesting as well as the most important is that promoted by the Metropolitan Water Board for the construction of huge storage reservoirs in the Thames so as to cope with the future demands of London. These works will, of course, be spread over a number of years. In the case of some of the Bills no powers are taken for the construction of new works, but the following estimates of contemplated expenditure on work described in other Bills are deposited:—Metropolitan Water Board, £6,900,000; Rhondda Urban District Council, £84,556; Rhymney Valley Water Board, £436,000; Merthyr Tydfil Corporation, £399,972; Oystermouth Urban District Council, £8,450; Blackburn Corporation, £75,000; Gloucester Corporation, £26,690; Ipswich Corporation, £26,000; Hastings Corporation, £49,830; Hull Corporation, £120,000; Rotherham Corporation, £20,000; Halifax Corporation, £30,000; Chesterfield Water Board, £185,251; Swinton U.D.C., £10,000; Southampton Corporation, £7,000; Paignton U.D.C., £27,500; Felixstowe and Walton Water Co., £60,432; West Cheshire Water Co., £27,228; Chester Water Co., £59,870; Ely Rural Water Co., £9,655; and Wirral Water Co., £8,175.

Docks, Harbours, and River Works.

The most important Dock Bill is that promoted by the Great Yarmouth Dock Commissioners, who wish to raise £250,000 to construct a dock 1,600 feet long and 400 feet wide. The Milford Dock Co. wishes for power to erect ice factories; the Southampton Harbour Board ask to be allowed to borrow £200,000 for the purposes of the undertaking; Bristol Corporation to borrow about £80,000 for dock purposes; the Manchester Ship Canal to be allowed to construct a pier; the Dover Graving Dock Co. seek an extension of time for the completion of works; and Mr. W. Horton asks for power to enlarge Rhos-on-Sea Pier and construct a marine lake.

Railways.

Twenty-four Railway Bills have been deposited, and the most important estimates for constructional works lodged are as follows:—Greater London Railway, £3,705,568; Metropolitan Railway, £84,807; Metropolitan District, £63,100; Gt. Northern, £818,260; Gt. Western, £385,402; North Eastern, £434,872; Alexandra Dock and Railway, £232,165; Midland, £941,627; North Yorkshire Dales, £486,044; Central London, £145,896; London Electric, £407,000; Barry Railway, £77,497; and Cardiff Railway, £54,933.

CLASSIC ARCHITECTURE IN ENGLAND AND AMERICA.

In this paper read before the Camera, Sketch, and Debate Club of the Architectural Association, Mr. A. E. Richardson seeks to show that the influence of the Classic Revival in England is potent in its effect on the present-day monumental architecture of the United States.

AT the present time, English architects are being stirred to greater efforts by the cultured and scholarly architectural style which is rapidly developing in the United States of America—a style which completely expresses the national character because it has all the attributes of fitness. This development of architectural design in America means to England precisely what the artistic activity of the archaic Greeks in Dorian Sicily, Magna Græcia, and the Ionian cities of Priene, Miletus, and Ephesus meant to the culmination of Hellenistic art at Athens.

America, with its unbounded resources, great commercial enterprise, and latterly a closer appreciation of the arts, has awakened the mother country to a fuller sense of dignity and responsibility with regard to the important question of the design of monumental architecture.

The Classic Revival in England.

The return of Inigo Jones to England, fired with enthusiasm for the works of Palladio, and with a still greater enthusiasm for the Roman antiquities, resulted in the magnificent plan for the new Palace of Whitehall; a plan undoubtedly suggested by the plans of the great Thermæ. Sir Christopher Wren lacked the opportunities of foreign travel and study abroad such as were enjoyed by Inigo Jones. Wren's knowledge of classic architecture was derived from such publications as Desgodetz's treatise on Roman architecture, Evelyn's "Parallels," and other works. His undoubted mastery in architectural composition was somewhat marred by the weakness of the ornament he employed, which has nothing of the classic spirit about it. Wren's successors gradually developed a pure Palladianism which in turn gave place to a Roman revival, followed by a Greek revival, and culminating in a style which was a combination of Greek, Roman, and Italian motifs.

Early in the eighteenth century it became the fashion for talented amateurs to travel abroad, and it was owing to the patronage of Richard Boyle, Earl of Burlington, that Castell's "Villas of the Ancients" was published in 1728. This nobleman collected statues, objects of art, and drawings. In 1730, he caused to be published Palladio's original drawings of the Roman thermæ, and generally advanced the ideas of the amateurs and professionals towards a greater purity of taste. The formation of the Society of Dilettanti in 1734, to promote the study of classic antiquities, the publication of Robert Wood and Dawkin's books on the "Ruins of Palmyra" (1753) and the "Ruins of Baalbec" (1757), and of Stuart and Revett's "Antiquities of Athens" (1762) and "Antiquities of Iona" (1769), and the examples afforded by the buildings of other architects who had travelled abroad, but who did not publish any works connected with their travels, all combined to familiarise Englishmen with the spirit of Classic art.

The Influence of Piranesi.

Piranesi's first dated etchings appeared in 1748, and consisted of thirty plates showing views of triumphal arches and other

Roman buildings. Copies of these etchings were acquired by the *virtuosi* in England, and the architects of the time constantly referred to these wonderful illustrations for inspiration and guidance. Sir William Chambers published his treatise on the decorative part of civil architecture in 1759, a work which still exerts its beneficial influence.

The Great Period of Civic Design.

The Regency period might be described as the great period of civic design. John Nash and Decimus Burton directed their attention to extensive compositions, and it was owing to the efforts of the former architect that the arrangement of Regent Street into imposing architectural blocks regulated as to height by the width of the street was rendered a successful achievement. The magnificent composition of the Regent's Park terraces designed to house the members of the aristocracy and to give them at once the advantages of a palace in London, with views reminiscent of their country estates, can be attributed to both the aforementioned architects.

The stucco work of this period has scale and dignity. More attention was paid to composition on a great scale than to beautiful detail. Much of the work at Regent's Park has nothing to deserve approbation. The detail will not survive analysis, and the sculpture is indescribable, but the scale is magnificent.

Work in Provincial Cities.

In addition to the work that was being erected in London, great changes in monumental design were occurring in Scotland and Ireland, as well as in all the large provincial cities of England. In Edinburgh were the superb High School and the Royal Scottish Academy, in Leith the Town Hall and the Customs House; in Glasgow, the Royal Exchange and Square and the Courts of Justice; in Paisley, the Town Hall; in Greenock, the Customs House by Playfair. In Dublin were three magnificent railway stations, including the Broadstone Terminus of the Midland and Great Western lines; also fine structures at Cork and Belfast. At Liverpool there were the Customs House, St. George's Hall, a branch of the Bank of England, and other works. At Newcastle, there was the fine Central Station by Dobson; at Leeds, the palatial Town Hall; at Huddersfield, a lengthy railway station of considerable merit; at Bristol, the new buildings in Corn Street; at Bath, the work by Goodridge the elder.

The whole of the foregoing work proceeding at that time in Great Britain and Ireland was a reflex on a smaller scale of the activity evidenced in London. The names of Soane, Smirke, Inwood, Nash, Decimus Burton, Barry, Tite, Basevi, and Pennethorne were household words; in fact, these distinguished gentlemen formed the nucleus of the Royal Institute of British Architects. The foremost English architects of that day were in constant correspondence with their French and American brothers, and an exchange of ideas took place which resulted in English architecture gaining a reputation for scholarly refinement and classic beauty.

The Greatness of Cockerell.

There is one name which I have not previously mentioned, a name so important in architectural development that I have reserved it to the last. I refer to Professor C. R. Cockerell, an eminent archæologist, a great architect, and a still greater designer. Cockerell commenced his travels abroad in 1810, and spent six years labouring at Aegina, Bassæ, and at Athens, afterwards returning to England through Italy and France. It is significant of Cockerell's work that it never approached pedantry. The professor himself said that regard for antiquity lost half its merit when it degenerated into mere facsimile reproductions; the more exact the copy, the greater the failure. Cockerell's finest building was the Sun Assurance office in Threadneedle Street, now very much altered by the insertion of another storey. This building shows the wonderful power of design the professor had, as well as displaying his profound knowledge of architectural history; the resulting combination of motifs is excellent. Greek finesse is allied to Roman scale and Italian warmth, and, underlying all, the master-hand of the genius can be discerned. The detail is always refined, and it approaches as near to freshness and originality as could be desired. I should, however, sincerely regret to see any of Cockerell's buildings or designs slavishly copied. If that were done, all hope of advancement would be checked. What must take place is a close study of his methods and style, and a sure knowledge must be obtained of the motifs he drew upon to make his work so thoroughly English.

To-day we stand bewildered amidst the Babylonian confusion brought about by the thoughtless reproduction of various historical styles. Indeed, it is the custom now to hear such remarks as, "What a fine Georgian library!" or "What a magnificent Elizabethan house!" instead of "What a successful library or expressive house!" Our civil architecture has been criticised by distinguished foreign architects as being akin to the art of the theatrical costumier. We have been engaged in reproducing buildings of romantic periods, regardless of direct design and modern expression. To quote Professor Cockerell: "The study of the beauties and defects of celebrated buildings should be the aim of the scholarly architect. This was the confirmation of theory, and led to that knowledge of form and combination which makes the accomplished architect. The importance of this confirmation of theory was admitted by every practical architect. No man invented an order or a series of mouldings. These he accepts from the greatest and most reputed masters who have preceded him. He stores designs, books, and portfolios, and prides himself, like the lawyer, on his precedents and authorities. Absolute invention he never proposes to himself for a moment; but by an enlarged study of history and examples he is able to detect the petty prejudices of schools, to emancipate himself from the trammels of nationality and fashion, and to regard the works of all times and countries as subject to his use so far as they may be conformable to strength, convenience, and beauty."

The Value of Criticism.

To this extract from one of the professor's lectures must be added a word with regard to the power of criticism. Although the critical power may be of much lower rank than the creative, it is none the less important. The merciless criticism to which the works of the Greek architects were submitted resulted in the

maintenance of a high standard of perfection; and were criticism to be a little more outspoken in this country, I venture to suggest that due regard would be paid to eliminating sundry superfluous trappings and tawdry ornamentations with which our new buildings are spoiled. I refer to the indiscriminate use of broken pediments, cartouches, rusticated columns, grotesque masks and fruity festoons, which have no direct argument in expressing the character of a structure. Such debased forms could very well be omitted, especially as they are used without any regard for sentiment. Buildings ornamented in this way masquerade under the title of Classic. They are not even pseudo-Classic; and already this neo-impressionistic form of architecture is meeting with the approbrium it so richly deserves.

Domestic versus Civil Architecture.

The cultivation of our domestic architecture has been at the expense of our civil art, and splendid opportunities for the creation of really monumental structures have been frittered away. Our efforts have been directed towards the development of a civil style based upon domestic motifs, instead of towards a grand monumental style which should express the culture, power, and might of the Empire. The lack of this appreciation of a monumental style is very apparent in the Colonies. Architects practising in Australia, New Zealand, and South Africa follow, through the medium of the building papers, the latest fashionable tendency in the mother country, and the reflex is in most cases worse than the original. Canada is the exception. There American architects are employed or closely followed, and the result has more than justified the experiment.

The Grand Style in America.

Judged by the high academic standards followed in France and America, we are decidedly provincial in our tastes. In a word, we have no definite standard of taste, no criticism, no unity amongst our leaders; and, lastly, we have no great National School of Design, which should serve as a finishing school. The architectural traditions of England are greater than the genius of any one practitioner, however capable he may be; and I feel sure that we have in this country some of the finest examples of monumental architecture the world contains. Unfortunately, we have not appreciated these works to anything like the extent to which they have been appreciated by the Americans, and it has been owing to the influence of these buildings that American architecture stands today on the bed-rock foundation of the "grand style."

In America during the early days of the Republic, architecture assumed a more monumental character. The first trace of European influence in this connection is to be noticed in the New York City Hall, built in 1803 and finished in 1812 from the designs of Mr. Comb. This building shows traces of the Louis Seize style in its general arrangement

The earlier buildings comprise the original State Capitol at Washington (1793-1839), the State House at Boston (1795), and the University of Virginia at Charlottesville (1817).

The Classic revivals in England, France, and Germany began to assert their influence on American architecture about this period, and reached their zenith about 1846. The greatest influence, however, came from England; and the magnificent contemporary academic architecture has

left its impress very strongly on the official architecture of America; so much so that it would not be very far wrong to say that the English tradition and character has, so far, predominated over all other phases of architecture practised in the States; and this in spite of the eclecticism now being pursued. The Civil War temporarily broke the chain of sequence between the earlier work and the work of the present day.

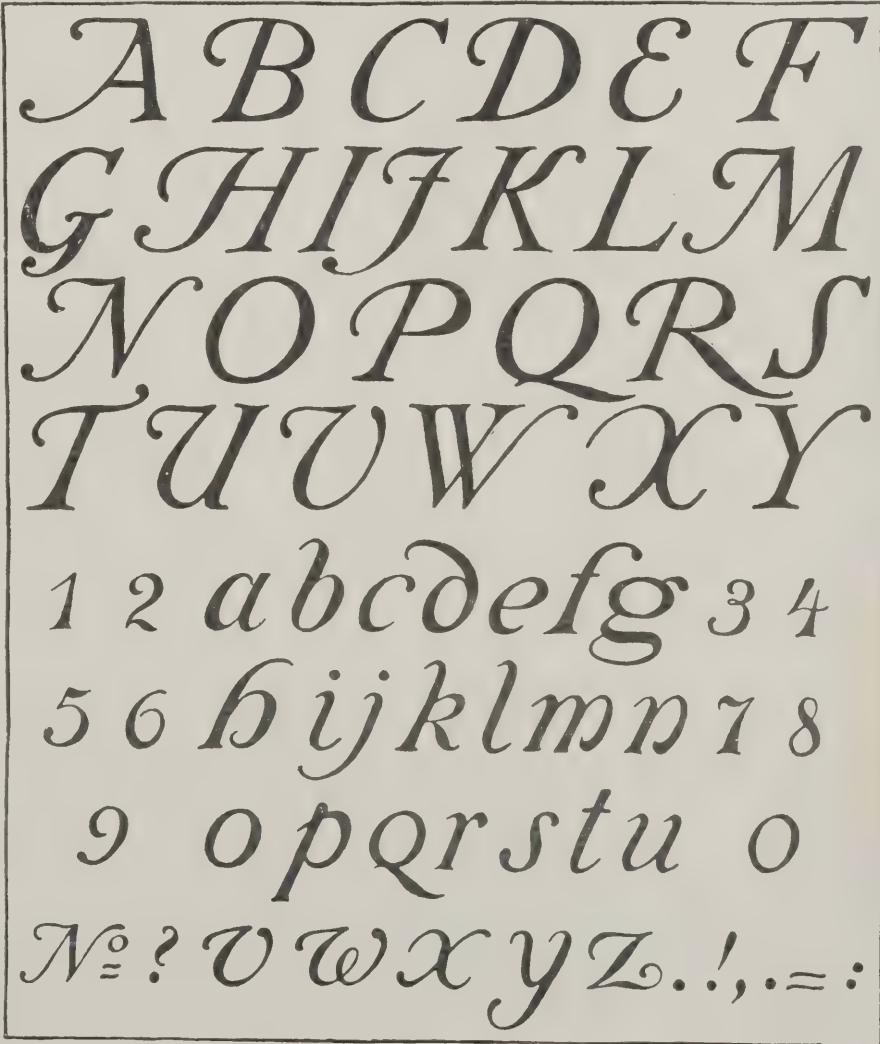

Such geniuses as R. M. Hunt (1827-95) and H. H. Richardson (1828-86) did much to attract the attention of the American public towards sound architectural methods. The establishment of schools of architecture in the great civic centres, and the opening of museums, stimulated a desire for foreign travel; and the result has been the extraordinarily rapid development of the national architecture. American students throng the studios of Paris and Rome. Their desire is not blindly to copy the works of past masters, but to emulate the spirit of these works, and to advance the art of architecture until it reaches a still higher plane. The work of Messrs. McKim, Mead, and White is too well known to be redescribed. These three gentlemen had the advantage of a Parisian training, but they had something a great deal more valuable to the practice of their art than even that; they were fortunate in having the rare gift of discrimination, and more than fortunate in having the reticence and austerity of the Anglo-Saxon character deeply engrained in their souls. American architecture today owes its style, character, and tone to the influence of the scholarly exponents of the Classic revival in England.

THE ROYAL AUTOMOBILE CLUB.

The new premises of the Royal Automobile Club in Pall Mall will be completed, it is expected, by the end of February. The total cost, including about £40,000 for interior furnishings, will not fall far short of £300,000.

The building occupies the site of the old War Office, with a frontage of 230ft. to Pall Mall, and extending to an average depth of about 150ft. Upon entering the main entrance hall access is at once obtained by three staircases to the main floor, which is 5ft. above the level of the pavement. A wide staircase at the rear of the entrance hall leads forward to the inner vestibule, smaller staircases on the left and right leading respectively to the ladies' reception-room and the strangers' room. The reception-room in turn leads directly to the restaurant, which is a commodious hall reaching from Pall Mall to the terrace facing Carlton Gardens, and occupying a depth of about 100ft. These two rooms, which will be the only portions of the building to which lady visitors will be admitted, are decorated in Louis XIV. style, the strangers' room being in the Georgian style. The entrance hall, however, is entirely dependent upon its architectural features for its beauty, there being an entire absence of decorative effects. A conspicuous feature of the restaurant is its fine large eighteenth century painting by Hubert Robert.

The strangers' room leads to the club-room. This is of similar dimensions to

A MODERN ALPHABET

the restaurant, and is decorated in Georgian style. The ceiling is an exact reproduction of the original Georgian ceiling at the old War Office.

Nine paintings by Hondekoeter and Morrow will lend additional distinction to this room.

The central oval hall or vestibule, which is reached from the entrance hall, extends through the centre of the entire building, and is ceiled by a glass roof. This hall is the distributing centre of the building, and from it most of the principal rooms radiate. Straight through this hall the lounge gallery is reached. This is 115ft. long, 40ft. wide, and 30ft. high. The chief attraction here is the painted Louis XVI. ceiling, with rolling white clouds on a blue ground, the general design of this apartment being after the famous *Galerie des Glaces* at Versailles. To the right of the vestibule is the club's post office, which is of substantial size, and will be provided with private letter boxes upon the American principle for the use of members.

On the first floor, to the east side, is the members' dining-room, with five lifts communicating with the kitchen. The committee-room and library are placed on the west side, while the billiard and card rooms occupy the Pall Mall frontage. These are all decorated in Adam style. On this floor, in front of the committee-

room, but reached by a private entrance and staircase, is a splendid apartment, overlooking Pall Mall, and St. James's Square, set aside for the use of the associates of the club.

The second floor is practically monopolised on the west side by the club's general offices, and on the east side by bedrooms, there being about 100 on this and the upper floors.

Descending from the entrance hall by spacious staircases to the lower ground floor, access is had to the swimming bath, Turkish bath, the fencing-room, gymnasium, three squash racquet courts, and the shooting gallery. Here are also the cloak-rooms, dressing-rooms, and a barber's shop. The east side of this floor is entirely taken up by the kitchen, servants' quarters, store-rooms, etc. An extensive gallery, with seating accommodation, extends towards the rear of the lower ground floor, and overlooks the racquet courts and other basement attractions. The walls and floor of the swimming-bath are lined with marble. The bath itself, which is surrounded by mosaic columns, and of Grecian design, is 90ft. long, 30ft. wide, with a depth ranging from 4½ft. to 8ft. The Turkish bath is also treated in Grecian style, the shampoo-room, plunge-bath, etc., being lined with marble. The three full-size squash racquet courts are

floored with teak, the walls being of the same material.

The architects of the building are Messrs. Mewès and Davis and E. Keynes Purchase, F.R.I.B.A., and the consulting engineer is Mr. Wingfield-Bowles. The building contractors are the Building Construction Co., Ltd.

PARISH CHURCH, COLDSTREAM.

This church, situated in High Street, Coldstream, replaces the old parish church, of which the tower and belfry are incorporated in the new building. The exterior is somewhat similar in style to the old building, the chief features being round-headed windows with architraves and projecting key blocks, and the wall-head finished with a simple cornice and parapet. The dressings are of Blackpasture stone filled in with random rubble. The floor of the church is of wood, but the passages and chancel are paved with stone in squares laid diagonally. Whitsome-newton stone columns are used in the interior to support the steel principals carrying the plaster barrel-vault. Doors, seating, etc., are of yellow pine stained and wax-polished, the stalls and communion table in the chancel being of oak. The pulpit is of stone. Mr. J. M. Dick Peddie was the architect.

PARISH CHURCH, COLDSTREAM. N.B. J. M. DICK-PEDDIE, ARCHITECT.

THE CARDINAL MEDICI'S PLEASURE HOUSE.

BY HALSEY RICARDO, F.R.I.B.A.

In his paper read before the Royal Institute of British Architects on Monday January 16th, 1911, from which the following extracts are made, Mr. Halsey Ricardo described the famous "pleasure house" contrived for Cardinal Medici, by Bramante, Da Vinci, and Raphael.

IN this case of the Cardinal's pleasure house—which bears the name of Raphael as its designer—one wants to know what are the architectural forbears of Raphael's ancestry. He was—we can see clearly—the son of Bramante, who was the son of Alberti, and half-brother to Leonardo da Vinci. But on each generation a cloud of cousinry impinges, and as each man grows up to man's estate he receives a call to Rome, and becomes thereon a changed idealist. The romance of Rome—the story of its past—seizes him, and for the rest of the term of his life he moves as in enchantment, looking backward, dreaming of the past, and vowed—as far as in him lay—to reproduce it. Not so Da Vinci, however. His ideals were in the future—so far before him that we have not even yet realised some of them. "He is the forerunner of an age that has not even yet arrived. He dreamt of giving mankind, by means of science devoted and subservient to art, the empire of the world. Between the man and his dream, time is lessening the distance, but the meeting is not yet. He passes beyond art and stands upon the very edge of infinity—face to face with the insoluble and yet forever questioning. He hints at more than we even yet know." He exercised the most unbounded influence on the world of his day—was painter, poet, sculptor, architect, mechanist, mathematician, philosopher, and explorer. He also studied botany and anatomy, was an admirable extempore performer on the lyre, and the first scientific writer on his special art of painting. If we ask for evidences of this extraordinary versatility and ability we are given in answer a few blackened canvasses, the bedaubed fragments of a ruined fresco, and the witchery of a smile. The manuscripts of Leonardo da Vinci are the chief existing proofs of that extraordinary talent with which he has been credited from the time of his earliest biographers downwards.

Bramante and Da Vinci.

At Milan—in the Court of Ludovico il Moro—the two men, Bramante and Da Vinci, came together and were friends. Leonardo has left schemes showing how a city should be laid out—one by an ingenious system of canals, one by having the roads in two storeys—the ground floor for goods, carriages, pack horses, and common people; the other, on the first floor, reserved for people of quality. The sanitary conveniences occur close to the stairs that connect the two routes, and the city is to be placed either on the seashore or where there is a wide river of sufficient current to carry far away its rubbish and its sewage. It is easy to suppose that such projects were done by the two friends in concert, and that each by suggestion and diagram illuminated the other. For sixteen or seventeen years they lived side by side.

A Building's Surroundings.

When the crash at Milan (4th April, 1500) came—after Beatrice's death—Da Vinci sought the patronage of the French king, and Bramante went to Rome. Up till the time that Bramante came, there had been little of the recognition of the contributory value—or the reverse—of a building's surroundings; the church and

convent cloister suggested and reproduced itself as the loggia in the piazza; fountains—as at Perugia and Siena—mitigated the heat and glare of the wide stretches of blinding pavement, and played into the hands of the Town Hall and Cathedral, as a small child mitigates the formality of a crowd, giving it a sense of scale and accentuating the air of seriousness by its own playful motion. The town walls hemmed in the houses too much to permit a pleasure garden of any size to the dwelling, still less could the count afford to enclose a pleasure within his castle walls outside the city. At Mantua, Isabella had made a beginning, and her sister at Milan had followed her lead, and worked on a larger scale; and both Da Vinci and Bramante had taken up this new conception and had worked at it *con amore*.

A Casino in the Vatican.

About fifteen years before Julius ascended the chair, Pope Innocent VIII. had built himself a small casino in the grounds of the Vatican palace, but a good long way off, across a valley and on a rising spur of the Vatican hill, whence a wide prospect was obtainable, and this he called his Belvedere. Since its erection a considerable number of antiques had been and still were being discovered, and Julius began to form the nucleus of the museums of the Vatican by placing the treasures there. He called in Bramante to connect this outlying pavilion of the Belvedere with the palace, so that he might enjoy the gratification of viewing his statues and other antique marbles with the comfort of being under shelter. To do this Bramante designed two galleries, which reached from the palace, bridging the valley, to the spur on which the Belvedere stands, and including the pavilion in one of its angles. The difference in levels was got over by excavation and accumulation; the enclosed pleasure was made in two heights; stairs and terrace walls linked the two long parallel sides about midway in their length, and the vista was finished by a colonnaded hemicycle, using the great bronze fir-cone from the ancient temple of Isis and Serapis as a fountain in its focus. The galleries were colonnaded arcades in two heights. You left the Vatican on the first floor and reached the Belvedere at its ground level. Besides these galleries there were alterations and additions to the Belvedere itself.

Raphael follows Bramante.

"The Pope, being determined to undertake the commencement of that stupendous building, the Church of St. Peter, caused one half of the older fabric to be demolished, and set hand to the reconstruction, with the firm resolve that in art, invention, arrangement, and beauty, as well as in extent, magnificence, and splendour of decoration, that edifice should surpass all the buildings ever erected in that city. With his accustomed promptitude the architect laid the foundation of his work, continuing his labours to the close of his own life, which followed soon after that of the pontiff." The first stone was laid 18th April, 1506. Julius died in 1513 and Bramante (aged 60 in the following year, leaving in his will the instructions that his friend Raphael should carry on his work

at St. Peter's. They had come—both men from the same country, Urbino; and Bramante had helped Raphael substantially with the architectural backgrounds and details to his pictures and frescoes. He was now, at Bramante's death, 31 years old. He could be trusted to hand on—undimmed—the principles that had actuated Bramante in his pursuit of realising the grandeur that was the dominant trait of antique Rome.

Leo X. had made his cousin Giulio a cardinal immediately on his accession to the Pontificate, and the cardinal set about devising a country retreat from the hot dusty streets of Rome, the noise and tumult of its inhabitants—outside the city, a mile or so away, on the slopes of Monte Mario, where, amid the silence of the groves and the cool plash of falling waters, he could build himself the *ne plus ultra* of a pleasure house, both in beauty, in sumptuousness, and in the scholarly treatment of its decoration. This was the Villa Madama.

Raphael as Landscape Gardener.

Raphael made for the cardinal various designs, and lived long enough to see the actual building started and the terraces beginning to shape themselves. His mind—eager to grasp and assimilate the word-pictures of the learned authorities poured freely into his ears—saw the possibilities of house and landscape gardening, and at once began to materialise them. The Villa Madama, after Raphael's death, was carried on by Antonio San Gallo the younger, as far as construction was concerned, Giulio Romano and Giovanni da Udine fashioning the decoration. The villa was never finished in its entirety. Pope Leo X. died most unexpectedly at the end of 1521, after a reign of eight years, aged only 45. The next Pope, a severe and ascetic Fleming, spread terror and dismay into the hearts of polite Rome by his grim disapproval of every form of luxury and the arts. Eventually the villa came into the possession of Margaret of Parma, daughter of the Emperor Charles V., and it is from her that it derives its name of Villa Madama.

But this attempt of the Cardinal's was the beginning of many such undertakings. The discussions that must have raged round it—the ideals as formulated by Raphael, by his pupils, by the literary authorities, by the rich patrons who crowded the Court of his cousin, Leo X. at the Vatican—helped to constitute this building as a model of what a country retreat and pleasure house should be, so that when, after the death of Raphael, his school was dispersed, and, after the sack of Rome, all employment for artists was for some years in abeyance, Baldassare Castiglione was able to pick up Giulio Romano and introduce him to the Gonzaga at Mantua, and Giulio Romano was able to fire that prince with a desire to have also a pleasure house of his own just outside the walls of Mantua. The ground where the horses were stabled and trained—the Gonzagas were great lovers of horse-flesh, and prided themselves on the superlative merits of their horses—was devoted to this purpose, and thus the well-known Palazzo del Tè came into being. All round Rome, at Tusculum, on the Alban hills, princes and cardinals took to building in after years these country mansions, with elaborated gardens, fountains, terraced walls, and sheltered arcades, and gradually a race of water engineers sprang up to construct the water jets, cascades, and hydraulic surprises that struck Evelyn's fancy so much, and won his admiration when he visited Italy in the days of Oliver Cromwell. Henry VIII.'s palace at None

such, Shakespeare's reference to pleached alleys, Bacon's directions for laying out the gardens to a stately house, derive from this initiative of Cardinal Giulio's as materialised by Raphael, and behind Raphael stand Bramante and Da Vinci.

Discussion.

Sir Charles Holroyd, proposing a vote of thanks, said it was an exceedingly pleasing thought to him that the idea of the villa garden and residence should come from Raphael. He regretted that Mr. Ricardo should have omitted to illustrate the Palace at Urbino, which revealed a lighter touch than any other work by Bramante of which he knew. Raphael certainly used Bramante, who was his school-master—not his father. Raphael was easily excelled by Leonardo. He (Raphael) never touched Leonardo in greatness, although he surpassed him in lightness of touch. He (the speaker) was acquainted with

some of the Roman villas, which exhibited the characteristics of the well-ordered garden, but which lacked, however, the regard for picturesque work in the garden, such as variation in ground levels.

Speaking of the laying-out of Pompeii, the speaker said he remembered standing at the crossing of two streets and seeing in one direction Vesuvius, and in another the beautiful bay and the town on the rocky shore. Looking at right-angles he saw to one side a view of the sea through a dip in the hills, and to the opposite side a fine view of the Apennines. The whole scheme appeared so natural; and the vistas occurred as though the scenery had been specially arranged. The two roads were rather stiffly placed, and not, in our modern sense, picturesque. Referring to Raphael, the speaker made allusion to "The Last Supper," at Milan, above which two shields were painted. These

were delightful, and deserved inspection, although they were usually passed unnoticed. "The Last Supper" was really the greatest thing ever done in paint; and if Leonardo had done this work only, his fame would rest secure. Pope Julius, he thought, although of an interfering disposition, was a good patron; and he (the speaker) was of the opinion that the best period of art was under tyranny. Many, he knew, would disagree with him.

Mr. Paul Waterhouse, seconding the vote of thanks, attributed the charm of the Renaissance to the ability to enter into its spirit and to share it with the men of a past age.

Mr. Halsey Ricardo, in the course of a brief reply, doubted Raphael's intimacy with Urbino, which he left when a child.

THE PRESENT POSITION OF BRITISH SCULPTURE.

BY W. REYNOLDS-STEPHENS.

In the January issue of "The Nineteenth Century," Mr. Reynolds-Stephens formulates a plea for the nationalisation and better patronage of British sculpture. The following are some abstracts:—

Just recently there has been at the Japan-British Exhibition the second representative collection of works by British sculptors, the first of such collections having been shown in the same galleries at the Franco-British Exhibition two years ago. That two such large gatherings of our sculpture could be got together so closely following one another confirms the now often-expressed opinion that in this branch of the fine arts there is recently great evidence of a renaissance here in Great Britain.

The works were there exhibited in such a manner and under conditions so favourable as to space and lighting that, for the first time, a somewhat just estimate of our sculpture—as a school—could be made. Placed, as it was in the Franco-British Exhibition, alongside so much French sculpture, it was quite justifiable that a Britisher should feel some pride, seeing how the craftsmanship of our works stood the test of that comparison.

But after careful thought and analysis devoted to the works individually, when they are seriously considered on a broad basis collectively, a question forces itself more and more to the fore: Is this British sculpture? Have we any modern school of our own? Speaking generally, our work is exotic; certainly in but a small degree can it be considered really British; born of national thought and bred on our soil. Yet in all directions there is evidence of vitality; the very diversity of aim and manner of working, the range of skill in craftsmanship, would be a real matter for rejoicing if only there were present a bond of national thought. So many attempt speaking in a foreign language rather than in our mother-tongue. One sees a large number of works almost French, works greatly influenced by the severer realism of the *Cinquecento* Italian; others attempting the vigorous mannerisms of the Michelangelo school, while some pose as followers of the Greeks; but there is terribly little which is our real own. We shall not be ourselves until we recognise that we must throw off this preponderance of foreign influence. Our sculpture may now be a fair parallel to Pope and his school, and we may take warning from the comparison; full of grace, of good colour, of brilliantly turned phrases, based

THE CHURCHILL COTTAGE HOMES, CHEDDAR VALLEY, SOMERSET: VIEW
LOOKING TOWARDS GARDEN SQUARE. SILCOCK AND REAY, F.F.R.I.B.A.,
ARCHITECTS.

upon a fine foreign tradition, but much in want of the spark of our British thought to give it real life. Much of it, like the writings of the Pope school, is full of good technique, but dead as ditchwater—futile attempts to reclothe dead bones in the manner of the French and Classics and give them forth to masquerade as living things. Our sculpture could do with even a little less brilliance of performance, if it could have instead a good bit more humanity and thought.

Our brothers the architects, when they are dealing with important buildings frequently make proposals for introducing sculpture, but these are of the items which are the first to be deleted from the scheme, at the order of the clients, on the score of needless expenditure. Most of such sculpture as is used now with architecture is required to be a mere revival of some old style, and does nothing for modern and national thought in sculpture; of Gothic, for instance, in which so many attempts are made to revive the old forms of sculpture for our modern churches. It is merely the masquerading of dead bones in lieu of living sculpture, with results that are a mere affectation and sham, deceiving only the unknowing and gullible donors, and filling our churches with sculpture as lifeless as the stones of which they are carved—our churches, the places of all others where only the most living work should find a place!

THE SOCIETY OF ARCHITECTS.

A new departure, so far as the Society is concerned, was made at the last meeting at 28, Bedford Square, when only formal business was taken, and the remainder of the time was devoted to social intercourse and music. The object of the gathering was to give members and students an opportunity of meeting together on a more friendly and informal footing than is possible under the usual circumstances; and that the Council's experiment was fully justified, was shown by the way in which the members and their friends availed themselves of the invitation.

The President (Mr. Geo. E. Bond) contrived to combine in his brief address (directed more particularly to the students) both instruction and humour, and his remarks were received with every indication of appreciation.

Round the walls of the reception rooms and in other parts of the building were exhibited measured drawings, sketches, water colours and photographs; the work of Col. F. S. Leslie, R.E., hon. secretary, Mr. B. R. Tucker, Mr. F. M. Cashmore, Mr. Frank Hearne, Mr. H. Y. Margery, Mr. S. R. Smith, Mr. A. B. Dury, Mr. A. F. Davies, Mr. F. R. Catling, Mr. J. T. Westbye, Mr. E. J. Williams, Mr. J. D. Stewart, and Mr. H. Phayre. Light refreshments were provided, and smoking was permitted. A feature of the evening was the excellent programme of music arranged by Mr. Willock, F.R.I.B.A.

During the evening the chairman extended a welcome to the visitors, and Mr. Max Clarke, F.R.I.B.A., in responding, referred with satisfaction to the arrangements made for the deliberations of representatives of the R.I.B.A. and the Society on registration, which he hoped would result in great benefit to the profession.

It is desired that in future the musical talents of members of the Society may be enlisted to add to the harmony of the gatherings, and the secretary will be glad to receive the names of any who are proposed to assist in this way.

FEDERATION NEWS.

National Federation of Building Trades Employers of Great Britain and Ireland.

The thirty-third annual report, for the year ended December 31st, 1910, which has been prepared for presentation at the annual general meeting, to be held to-day at the Trocadero, is very voluminous, and from the large number of interesting items it contains, the following few extracts will be found of use and interest.

Conciliation Boards.—The National Board has held two meetings during the past year. The first heard an appeal of the Birmingham carpenters and joiners, and decided that the case be deferred until next March, and then come back to the Board for settlement; the second was the annual meeting, when the various proposals put forward by the operatives for amending the rules were considered and rejected, except as to the eligibility of delegates sitting on more than one section of the Conciliation Boards, as to which there was evident a strong desire on the part of the operatives that some alteration should be made. Eventually as a compromise the employers suggested the following proposal: "That members of the various Conciliation Boards who may be members of any Board having considered a case, shall not sit personally on any subsequent hearing of the said case, but shall send substitutes," which the operatives also considered would be acceptable to their side. This proposal was approved by the last general meeting, and has also been approved by two of the centres, and awaits the approval of the remaining centres, which is expected shortly.

An appeal of the Nottingham bricklayers was also heard and settled, giving an advance of 4d. as from 1st January next, and making some other minor alterations.

The Workmen's Compensation Act was also considered with special reference to the working of the Durham miners' scheme, and the advisability of setting up Arbitration Committees under the Act in the Building Trade, also the question of the importation of work from low-paid districts. Both questions were remitted to a special sub-committee for further investigation and report.

Two recommendations from the previous annual meeting, having been before the parties for the intervening time and no objection taken, were now made part of the rules. The first is an addition to Rule 12: "That the side which fails to find a quorum at any meeting shall pay the third-class railway fares and 10s. a day expenses of each of the representatives of the other side who have attended." The second is a new rule that: "If any dispute or question has been referred to any of the Boards of Conciliation, it shall not be competent for either side to give notice for an alteration of any local working rules having reference thereto, pending completion of the procedure for conciliation set forth in these rules; but in the event of no decision being arrived at, or if a decision is given without stating the period for which it shall endure, it shall be competent for the applicants to give notice for alterations of rules if delivered within 14 days thereafter, and counter notices if delivered within a further 14 days, notwithstanding the provisions of any local working rule as to notice; provided always that such notices shall expire on the date given in the said local working rules." No notices for amending rules have been received this year.

South African Federation.—On the 17th September, Mr. Jas. T. Brown, Secretary of the South African Federation, after a visit to this country of some five months, returned home. He has sent out a number of masons to the Transvaal on a two years' contract, and arranged for more to follow if required. Mr. Brown expressed himself as pleased with his experience of our meetings, and ready to advise his Federation to become affiliated to this Federation, and a formal intimation to that effect may be shortly expected.

Press Articles.—Nearly fifty articles upon matters of importance to the Building Trade, and intended to advance the interests represented by the Federation, are enumerated as having appeared in the official journal.

The Dublin M.B.A. have succeeded in agreeing with the Royal Irish Architects' Institute on a Form of Contract for use where quantities do not form part. The following comparison will indicate the points of agreement and difference between the New Irish Form of Contract and the Agreed Form in use in England. The Lancashire, Cheshire and North Wales Federation, which has put forward suggestions for amending Clause 30 of the Agreed Form of Contract as some remedy against the locking-up of builders' capital in balances owing on completed contracts and is supported by the Northern Centre, has considered the Irish Form and recommends its substitution for the Agreed Form with the addition of the said proposed amendments to Clause 30 thereof. A deputation has been appointed by the Administrative Committee to bring the matter before the Council of the R.I.B.A., and the Institute of Builders has been invited to join in making representations thereon, but has decided: "to take no action in respect of the application of the National Federation for the amendment of the Agreed Form of Contract and thinks that any proposal to disturb the existing arrangements undesirable at the present time." Considerable activity is being displayed by branch associations in pressing upon public authorities the adoption of the Agreed Form of Contract.

Stamp Duty on Contracts.—Members are reminded that while a 6d. stamp on a contract between private persons or firms makes a contract legal, binding, and enforceable, it is necessary in all

cases where a limited company is a party to the contract under seal, that it should be stamped with a 10s. stamp. If the contract is made "by a duly authorised agent" to the company, signing his hand only, and adding the words, "as agent for X Co., Ltd.," the 6d. stamp is in ordinary cases sufficient. There are some objections to the latter procedure in the event of proceedings being taken, but the balance of convenience and saving of expense is sometimes deemed to outweigh these objections. Members are urged to see that the proper stamp is affixed in the case of contracts or sub-contracts in order that they may be both binding and enforceable, and to consider the expediency of paying the higher duty to place the matter beyond doubt.

Deputation to the Institution of Municipal and County Engineers.—A Deputation consisting of the President (Mr. Smethurst), and Messrs. J. W. White, Jas. Wright, F. Higgs, A. W. Sinclair, Officers of the Federation and the General Secretary, conferred with the Council of the Institution of Municipal and County Engineers, on the 29th October, to explain the views held by this Federation in relation to the present practice of appointing the Engineer to a local authority the sole arbitrator under building and engineering contracts carried out for the said local authority. The representations of the deputation met with a favourable reception by the Council of the Engineers, who, "while unable to believe in the possibility of any unfairness arising from the practice above referred to, expressed themselves very desirous of meeting the views of the Federation, and therefore if our Federation will be prepared to accept the President for the time being of this Institution, or person nominated by him, as Arbitrator under Contracts between Municipal Authorities and members of this Federation, the Council of the Engineers will advise the members of that Institution accordingly." A draft arbitration clause has been submitted for the consideration of the Council of Municipal and County Engineers. It is identical with the corresponding clause in the Agreed Form of Contract except in so far as there is no option left to the parties to select an arbitrator by agreement. It is hoped that an agreement in regard to the arbitration clause will lead to the taking up of the larger question of a model form of contract for municipal and other public works.

Provisional Sums and P.C. Items.—A clause in the form of contract of the West Riding of Yorkshire County Council runs, "all provisional sums and prime cost items (and where the Committee have exercised the option of direct employment, of sums which may have been added for profit, carriage, fixing, etc.) will be deducted from the account of contract in all cases, and the Committee will pay the same direct." A deputation has been appointed to interview the County Council with respect to the above matter and other grievances, and meanwhile members are recommended to object to subscribe to the above condition.

The Yorkshire Federation circularised the Yorkshire Architects, setting forth its desire for the following points of practice to be observed in regard to Tenders and Contracts. (a) Bills of quantities to be supplied wherever works are likely to exceed £300 in value. (b) Bills of quantities to contain an item to cover Workmen's Compensation Insurance. (c) That only the firm whose tender is favourably considered be asked to supply a schedule of prices. (d) That should the work proceed, the firm so supplying a schedule of prices shall be employed. (e) That schedules of prices shall be presented at the office of the Architect and shall be looked over in the presence of the Contractor, and thereupon placed under seal and only referred to for the adjustment of the accounts. (f) That certificates for payment of money due to the Contractor shall be sent to him and not to the building owner. (g) That P.C. sums be avoided whenever possible, but where included, the Contractor to be entitled to a profit of (5) per cent. for incidental costs, be entitled also to all cash discounts, and that retention money be paid in accordance with the agreement, and in case of default, that interest at the rate of 5 per cent. shall be paid on such balance. (h) That the Contract shall provide for the appointment of an Independent Arbitrator. It is reported that these proposals have been substantially accepted by the Leeds and Yorkshire Architectural Society.

Conditions of Tendering.—Protests against conditions have been made to the East Riding County Council, the Warrington Town Council, the County Council Schools, Waterloo, Liverpool, the L. & N.W. Railway Company, the West Riding County Council, the Hants County Council, and the Institution of Civil Engineers. The reply of the latter to the representations of the Deputations of the Officers of this Federation, was shortly, that, while sympathising with us on several matters, they deemed it inadvisable, if not impracticable, for the Institute to formulate a pronouncement applicable to the particular difficulties and grievances in question, and at the same time properly applicable to engineering contracts generally. In the other cases the protests were successful in bringing about important modifications in the conditions. The East Riding County Council Education Committee has decided to supply bills of quantities for all building work which is likely to cost more than £400.

Schedule of Contract Prices for Ordinary Works and Repairs, under H.M. Board of Works.—As a result of the correspondence conducted with the Office of Works, it is stated unofficially that in future a profit of 15 per cent. will be allowed on day-work labour, instead of 10 per cent. as hitherto.

Labour Exchanges.—It having been stated in the Press that a deputation from the Trades Union

Congress were interviewing the President of the Board of Trade on 1st March, with reference to amending the regulations governing the working of the Labour Exchanges, a letter was sent to Sir H. L. Smith referring to the matter, and asking that if as a result of the representations on 1st March, some changes are contemplated in which this Federation may be interested, it would like to be afforded a chance of considering the proposals and of offering observations thereon before they were given effect to. In reply, Sir H. L. Smith stated he was glad to be able to assure the Federation that before any material change is made in the present regulations, full opportunity shall be given for an expression of Federation views.

Unemployment Insurance.—In view of the probable introduction at an early date of a measure to provide for compulsory insurance against unemployment of workmen employed in the building trade, a communication has been sent to the Home Office calling attention to the serious and ever increasing financial burden already borne by this industry to provide for workmen's compensation insurance, stating that much of this is due to the heavy cost of contesting and settling claims and requesting that something be done to remedy these abuses, and that precautions be taken to prevent similar abuses in regard to Unemployment Insurance.

Builders and the New Land Value Duties.—A Deputation consisting of the President, Senior Vice-President, and the General Secretary, attended at the Treasury on 6th October last, by invitation of the Chancellor of the Exchequer, who desired to remove some misapprehension which he thought existed among builders interested in the development of land, as to the effect of the New Land Value Duties and especially of Increment Value Duty upon their business. The interview was fully reported in the press, and copies of the shorthand notes have been printed in pamphlet form and freely distributed to the County Federations for the use of members. Further copies can be had on application. One case illustrated being from actual experience, met with appreciation from the Chancellor of the Exchequer, and enabled him to make some definite pronouncements of an interesting kind and incidentally to promise to clear up some obscure points by subsequent legislation. With regard to the conveying of land direct from the landowner to the purchaser of a house erected thereon, without any intermediate conveyance to the builder, the Chancellor of the Exchequer has made it clear, in response to a special enquiry, that this practice will not be interfered with by the new Finance Act.

Electric Wiring and Fitting Powers.—An injunction having been obtained recently against the Leicester Corporation restraining it from exercising wiring powers without express authority of parliament, the question is being considered as to the best steps to take to safeguard members in regard to other attempts of a like nature.

Departmental Committee on Lead Poisoning.—At the request of the Home Office this Federation, in June, 1909, after conferring with the parties concerned, submitted the names of three gentlemen as properly qualified to represent the interest of Employers of Painters, on the above Committee, viz.:—To represent this Federation, Mr. J. W. Bellamy, of Birmingham; the L.M.B.A., Mr. F. G. Rice, of London; the Nat. Assoc. of Master House Painters and Decorators, Mr. W. G. Sutherland, of Manchester. It was subsequently decided to delay the appointment of this Committee until the Committee appointed to consider a similar question in connection with the Pottery Industry had reported. This report has now been received and it is desired to proceed with the Committee on lead poisoning in the house painting trade. Originally the Federation was asked to submit only two names, but was permitted to submit three, subject to confirmation by the then Home Secretary, Mr. Gladstone, because of the representations made as to the insufficiency of two to properly represent the interests affected. The Home Secretary (Mr. Churchill) after regretting his inability to accept three, asks the Federation to submit two only of the names. The President has written to the Home Secretary suggesting that he retain the three names, but if he cannot, requests him to make his own choice, as it is a matter he (the President) would not like to deal with.

International Federation. Meeting of Provisional Committee.—The Secretary attended a meeting of the above Committee held at Brussels, on 24th October. A report has been sent to the Federations so that they may consider the questions therein raised and instruct their representatives thereon prior to the Annual Meeting.

Midland Centre.

The annual meeting of members of the Midland Centre was held at the Imperial Hotel, Birmingham, on January 12th. The president, Col. John Barnsley, J.P., took the chair, and thirty-seven members were present. The minutes of last half-yearly meeting were read and confirmed. The secretary was instructed to attend the annual general meeting of the National Federation on January 25th.

New Officers.—In the ordinary course, Mr. Albert S. Smith, of Birmingham (senior vice-president for 1910), should have been appointed president for this year. Unfortunately, both he and the junior vice-president (Mr. F. H. Fish, of Nottingham) were prevented through business and other reasons from accepting the office. The following appointments were made:—President, Councillor J. Hardy, Walker (Derby); vice-presidents, Messrs. J. B. Whitehouse (Birmingham), and W. Yates (Leicester); treasurer, Mr. H. Willcock (Wolverhampton); auditors, Messrs. H. Cave (Wolverhampton), and R. Webb (Birmingham).

REPRESENTATIVES.—Messrs. H. Willcock and Albert S. Smith were nominated as the two representatives of the Centre on the Administrative Committee; Councillor J. H. Walker (president), Messrs. F. G. Whittall, J. H. Kellett, and J. Wright, were chosen to represent the Centre on the National Conciliation Board; Messrs. W. Yates (Leicester), W. Wistance (Walsall), J. Stokes (Worcester), F. H. Fish (Nottingham), H. Cave (Wolverhampton), W. Moffat (Birmingham), J. B. Whitehouse (Birmingham), A. W. Chamberlain (Burton-on-Trent), Councillor H. Smith (West Bromwich), and R. Weston (Derby), were elected as employers' representatives on the Midland Centre Conciliation Board; Councillor J. H. Walker, Councillor H. Smith, and Messrs. A. Chambers, F. G. Whittall, F. H. Fish, W. Wistance, H. Willcock, and Albert S. Smith, were appointed members of the National Council; and Mr. W. Smithies was re-nominated as plasterer representative on the joint committee under the N.A.O.P. agreement.

ANNUAL REPORT.—The annual report stated that several difficulties with the operatives occurred during the year, but they were mostly settled by means of the Conciliation Boards without serious friction. Five meetings of the Midland Centre Board had been held, at which two disputes (with the Birmingham labourers and the Mansfield carpenters and joiners) had been settled. In two cases affecting Birmingham carpenters and joiners and Nottingham bricklayers no settlement could be reached. There were 15 local Conciliation Boards, an increase of one. The associations affiliated to the Centre were the same as the previous year, and the membership of most was either maintained or increased. An unsatisfactory state of affairs existed in regard to the North Staffordshire and Nuneaton Associations. On the other hand two associations (at Kidderminster and Sutton Coldfield) were joining the Federation this year. Efforts had been made to get in builders in non-association areas as individual members of the Centre, but up to the present without success. The cash in hand on account of the National reserve fund was £87 11s. 9d., and the sum of £120 became due to the National Federation at the end of the year. The fourth annual Conference of Midland Centre secretaries was held in Birmingham on March 10th last, and was attended by the National secretary. At the suggestion of the Conference, confirmed by the Executive Council, the secretary prepared and circulated among the local associations a report on the inter-trading rule. This rule had now been adopted by the Birmingham, King's Norton, and Northfield, Leicester, Nottingham, West Bromwich, and Wolverhampton Associations. The Executive Council had decided to publish in February a Midland Centre year book and directory, and a sufficient number of orders for advertisements had been received to insure the success of the venture. The most unsatisfactory feature of last year's record was undoubtedly in connection with the collective insurance scheme. The subscriptions from the associations had come in slowly, and one or two showed a falling-off in amount. The report closed with a tribute to the president (Col. J. Barnsley, J.P.) for his unremitting and invaluable services during the past year.

RESOLUTIONS.—The report and balance sheet were adopted. It was decided to hold another conference of Midland Centre secretaries this year. £80 was voted to the National Federation on account of the National Reserve Fund, and the Finance Committee were instructed to consider the best means of raising future instalments. Firm action was taken in regard to the North Staffordshire Association. The meeting approved of the principle of collective insurance, and instructed the committee to make enquiries and to submit a scheme to a special meeting of the Executive Council to be held in June. The meeting also approved of the principle of entering into agreements with organisations of the allied trades which are willing to give advantages in price to members of the Federation. The scheme in regard to an International Federation, sent down by the national secretary, was agreed to. The Emergency, Finance, Collective Insurance, Organisation, and Year-book Committees were appointed. The meeting accepted an invitation from the president to hold the half-yearly meeting in July at Derby.—FRED W. AMPHLET, Secretary.

Wakefield and District.

A meeting of the members of Wakefield and District Master Builders' Association was held at the Great Bull Hotel, Wakefield, on January 5th, Mr. James Pashley (president) in the chair.

A letter was read from the Operative Joiners' Society suggesting that some of the members of the association were not carrying out the working rules with regard to working time during the winter months, and the matter was referred to a committee of the master joiners.

Correspondence was read from the secretary of the Yorkshire Federation respecting the new directory which the Federation were about to issue. It was decided to obtain a supply of copies of the directory and furnish each member of the association with a copy.

The President reported on his visit to the December meeting of the Yorkshire Federation, and several questions which had been brought before the meeting were discussed.—J. BEAUMONT, Secretary.

Tyne and Blyth Federation.

The annual dinner of the Tyne and Blyth District Building Federation was held on January 10th, in the County Hotel, Newcastle. The chair was occupied by Mr. W. T. Weir, president of the Federation.

The loyal toast having been honoured, Councillor Stephen Easton proposed "The National Federa-

tion of Building Trades Employers." He referred to the great value which the Federation had been, first, in the promotion of the National Conciliation Board, afterwards the local Boards, and in the settlement of local disputes. He coupled with the toast the name of Councillor S. Smethurst, the president of the National Federation.

Councillor S. Smethurst, replying, mentioned that the last week he had had the honour of being invited by a bishop to accompany him on a motor tour for the purpose of advising on the laying out of a district in which there would be great developments shortly. Coal had been found, and in a few years there would be thirty or forty pits sunk. The bishop wished advice in the laying out of the land, and on planning and house building. Mr. Easton had referred to the fact that the National Federation had been of use. Their organisation had demonstrated that wherever claims were made that were not fair they were strong enough to deal with it. They had long ceased to have any serious trouble with the operatives. Their organisation had justified its existence by stopping the little harassing things which obtained in the conduct of their business in the past. As far as he knew, they had the very best relations with the trade unions. The Conciliation Boards had come into existence, and in the three important branches a strike was impossible until every other resource had been exhausted. He thought there ought to be an arbitration clause in contracts, and he was glad that the committee of the Architects' Institute had fallen in with their view, and were now considering a form of arbitration clause which they would be willing to recommend. They had also suggested a form of contract of universal application. Builders in the past had, he said, been too much affected by the commercial spirit, and produced what was cheap and often nasty. He looked forward to the time when the members of their association would do work of a quality that they might be proud of, and that their cottage work, as well as more important work, should be such as should endure and be a credit.

Mr. F. W. Ranken gave "The Tyne and Blyth District Building Trades Federation." He said they had already done good work, and more could be done if the members supported them as they should.

Mr. W. T. Weir, president of the Tyne and Blyth Federation, in reply, claimed that their local organisation was as good as any in the country. The Conciliation Board had been extremely useful so far as Tyneside was concerned. Few people knew what good had been done by the Board. They had never had to go to the National Association for the settlement of any dispute. Everything had been settled by conference with the operatives.

The chairman of the local association, Mr. A. Pringle, Newcastle; Mr. T. Anderson, South Shields; Mr. J. F. Newbold, North Shields; and Mr. J. Simpson, Blyth, also responded.

COMING EVENTS.

Tuesday, January 17—Saturday January 28.

ROYAL INSTITUTE OF BRITISH ARCHITECTS, 9, Conduit Street, W.—Annual Exhibition of Students' Designs and Drawings, 10 a.m., to 8 p.m. (Saturday, 6 p.m.).

Tuesday, January 24—Saturday, February 25.

L.C.C. CAMBERWELL SCHOOL OF ARTS AND CRAFTS, Peckham Road, S.E.—Annual Exhibition of Students' Work. 2 p.m. to 10 p.m.

Thursday, January 26.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY, 10, Park Row, Leeds.—J. J. Woods, A.R.I.B.A., on "The Comacine Guild."

Monday, January 30.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—President's Address to Students, and Presentation of Prizes. 8 p.m.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.—Frederick Wedmore on "Etching" (Second Lecture). 8 p.m.

LECTURES ON MEDIEVAL ARCHITECTURE, Lecture Theatre, Victoria and Albert Museum.—Banister Fletcher, F.R.I.B.A., on "Parapets, Sculpture, Stained Glass, Church Fittings." 5 p.m.

Tuesday, January 31.

ROYAL SOCIETY OF ARTS, John Street, Adelphi.—F. Douglas Osborne on "The Tin Resources of the Empire." 4.30 p.m.

UNIVERSITY EXTENSION LECTURES.—Banister Fletcher, F.R.I.B.A., on "Ancient Architecture": the Thorne, Lecture Room, British Museum, 4.30 p.m.

MANCHESTER SOCIETY OF ARCHITECTS, Canada Chambers, 36, Spring Gardens, Manchester.—Students' meeting. 6.30.

LECTURES ON ANCIENT ARCHITECTURE, Lecture Room, British Museum.—Banister Fletcher, F.R.I.B.A., on "Theatres and Amphitheatres, Circi." 4.30 p.m.

Wednesday, February 1.

WORSHIPFUL COMPANY OF CARPENTERS, Carpenters' Hall, London Wall, E.C.—Henry Tanner, jun., F.R.I.B.A., on "The Art of the Woodworker." 7.45 p.m.

Monday, February 20.

ROYAL SANITARY INSTITUTE, 99, Buckingham Palace Road, S.W.—Charles Porter, M.D., on "Duties of a Sanitary Inspector: Outdoor." 7 p.m.

ROYAL ACADEMY PRIZE DESIGN. BY L. HOLCOMBE BUCKNELL,

THE ARCHITECTS' & BUILDERS' JOURNAL.

A Royal Academician on Perspective.

THE apparent difficulties of perspective arise chiefly from the books written to explain it. The geometrical principle governing perspective is really a very simple one, and anyone who has mastered it ought to be able to apply it to the construction of any figure by the exercise of a little reasoning; but books on perspective are almost always written as if the object were to do all the draughtsman's thinking for him, and he is presented with a host of diagrams for putting this, that, and the other kind of object into perspective, all of which are only various applications of the same process. The consequence is that the beginner is alarmed by a crowd of complicated diagrams which lead him to think that the subject is much more abstruse than it really is.

Mr. Storey's book* is no exception in this respect. There is far too much of it, the object being apparently to work out every possible problem for the student. What is the use, for instance, of a special section showing "How to draw a hexagon in perspective"? Anyone who has learned how to find the position of a point in the picture, and how to draw a circle in perspective, should be at no loss over a hexagon or an octagon. "How to draw a circle in angular perspective" actually suggests a special problem which does not exist; a circle in perspective is a circle in perspective, whether any square by which it is contained is seen in parallel or in angular perspective. And there are other points in which

FIG. 11.

FIG. 12.

Fig. 1.

Fig. 2.

the author seems to be confused in his own mind, or at all events confuses the mind of the student.

In Figures 11 and 12, for instance, which we will call for our purpose Fig. 1, the object apparently is to show that a too near point of view of a pavement tends to give a bad impression in perspective. The two squares (*cd*, *ef*) represent, we are told, "the ground plans of two squares at different distances from the picture," and the spectator is first at A, the corner of the near square, and then at B, the corner of the further square. If the spectator is in each case close to the angle of the square he will see both in the same way, in angular perspective; and the matter is further complicated by showing the result below as a square in parallel perspective. We can hardly imagine an explanation more absolutely confusing to the student. It was only after some consideration that we arrived at a conclusion as to what the author probably meant; he seems somehow to have confused the distance of the spectator from the picture-plane with the distance of the object. What we presume that he meant, or should have meant, may be more intelligibly explained in this way. Fig. 2 represents the plan of a chequered square, to be put into perspective on the picture-plane P, on the left with a near station-point (S), on the right with a more distant one. The dotted lines drawn to S give the perspective widths in the two cases; in the sections on Fig. 3 the dotted lines give the perspective heights on the picture-plane, where they cut the picture-plane at *cd* and *ef*. Fig. 4 shows the two results; A for the near point of sight, B for the distant one. We think that explanation will be intelligible to any reader; the author's certainly is not.

There are other statements in the book which we cannot accept, and which likewise seem to imply a confusion of perception. For instance, it is stated (page 19) that "if we

*The Theory and Practice of Perspective. By G. A. Storey, A.R.A., Teacher of Perspective at the Royal Academy. Oxford: Clarendon Press: 1910.

Fig. 4.

Fig. 3.

represent a domestic scene in a small room, we must not make our distance-point too far off, as it would exaggerate the size of the room" (!) Every practised architectural draughtsman knows that to give a correct impression of the size of a perspective interior it is necessary to assume an imaginary point a considerable distance away from the room, which will otherwise appear to have an exaggerated length owing to the sharpness of the perspective. Fig. 5 shows two perspective interiors laid down from the same plan; A from a near point of view, B from a distant one. Which looks the longer? The author's own two sketches on page 35, to show the disadvantage of a too near point of view of an interior, illustrate the same fact; the one with the near point of view looks a great deal longer than the other.

Painters seem to have rather a confused idea also (as we have noticed in other works) as to the effect of the curvature of the earth on sea horizons. Mr. Storey tells us categorically in a footnote, that "in a sea-view, owing to the rotundity of the earth, the real horizontal line is slightly below the sea line." Does he suppose, then, that the surface of the sea *rises* in a curve between the spectator and "the real horizontal line"? It has that appearance, no doubt, under some circumstances. If you follow with the eye the curve of a bay some fifteen miles across, you find that as the coast-line curves outwards and onwards, the beach and

the lower strip of the land disappear, the curve of the sea cutting them off, and appearing, in a sense, to rise between the eye and the distant land; but the real fact, of course, is that the whole surface, beach and all, is curving downwards, till eventually the beach, at the further side of the bay, disappears behind the sea line. In other words, from the spectator's standpoint the curve of the earth is continually dropping, and therefore the imagined horizontal line, which is theoretically on a level with the spectator's eye, is above and not below the sea horizon. It makes small difference in practice, but we may as well have the facts correct.

But the most curious statement in Mr. Storey's book is one which we find among the "Rules of Perspective"; "All horizontals which are at 45 deg. to the picture-plane are drawn to the point of distance." This is connected with what seems to be a wide-spread fallacy with the writers of perspective manuals generally, viz., the idea that there is some sacred necessity for the lines from the eye which give the two points of distance forming an angle of 90 deg. Apparently this is because perspective is generally illustrated by diagrams of rectangular objects. But even in that case it does not follow that either distance point should form an angle of 45 deg. with the picture-plane. An architect lays down a plan of a rectangular building sufficiently canted from the picture-plane to get what he thinks will be the best effect, and he finds his distance points for each face of the building by drawing lines from the point of sight to the line of the picture-plane parallel with the two sides of his plan; they form an angle of 90 deg. *because the plan of the building does*, but probably neither of them is at an angle of 45 deg. with the picture-plane. But Mr. Storey seems to think that the distance point is something got by a line at an angle of 45 deg. with the picture-plane. In the diagram Fig. 6, which is traced from his book, he points out that the angle at A being (on plan) less than a right angle, its line is not produced to the point of distance (C in our diagram) but to the point B. But the point B is the point of distance. Suppose that line were part of the plan of one of the modern American cities all built on an oblique line; then B would be the point of distance for the whole

Fig. 6.

drawing. The assumption that the point of distance has anything necessarily to do with an angle of 45 deg. is a mere superstition. The real position may be expressed thus:—

The point of distance represents the relation between the actual direction of lines in the scene, and the position of the spectator.

If writers on perspective would get that axiom into their heads it might clear their minds (and their books) a little, and show them that there is no fixed angle for finding distance points, and that the angle by which they are found depends entirely on circumstances.

We have generally observed that painters are not very strong in perspective, as it is understood by architects; we remember how a very eminent painter was found painting the interior of a temple from an elaborate model, confessing that he could not get the perspective right otherwise; and we often see domes and curved cornices very badly drawn in pictures of buildings. Mr. Storey is evidently much better up in the subject than most painters; his illustration of the method employed by architects in setting out perspectives is quite correct (we have been told by painters that "they cannot understand it the least"); and we owe him recognition for one very ingenious suggestion for getting over the inconvenience of a distance point far out of the

Fig. 5.

himself. Mr. C. H. Shannon is in rather a different position; there is still a good deal of difference of opinion as to the merits of his paintings, which are attempts to give poetic significance to combinations of figures sometimes rather eccentric and unbalanced in style and composition; but he is, no doubt, a very clever and original painter, and his election, like that of Mr. Hornel Moor three years ago, seems to indicate a desire on the part of the Academy to adopt a rather more catholic spirit in Art than it was formerly credited with.

The Mall Improvement.

IT is a very unfortunate and undignified termination to the scheme of a great national memorial that two public bodies should be found fencing and (on one side) cheese-paring as to who is to have the responsibility of completing it. The sudden backing out of the Office of Works from what was almost an understanding to contribute £50,000 in favour of the reduction of that amount by one-half, is not a creditable thing to the Government in the case of the memorial to a great Sovereign. The latest move of the London County

Council to contribute £75,000 on condition that the Office of Works complete the scheme, and relieve the County Council of all responsibility, looks rather like a piece of temper—not quite inexcusable; but at all events the County Council have shown a right spirit in stating as one reason for the increase in their offer that “if the Council contributes at all to a great national memorial, it should do so in a free and generous spirit”; in other words, if the Government is stingy, we will set a better example. It would certainly be best now that the Government should accept this offer and complete the scheme. Sir Melvill Beachcroft, in a letter in the “Times” of Friday, thinks the County Council are improperly giving up their official duty of carrying out a street improvement; but he forgets that in Sir Aston Webb’s original design, as selected in the competition, the continuation of the memorial road into Charing Cross was part of the scheme. That was before the present terminal building with its three arches was thought of; and it is hardly fair for the Office of Works to say now, that their responsibility stops with that building, which was no part of the original design. So far, we think the London County Council certainly has the best of the argument.

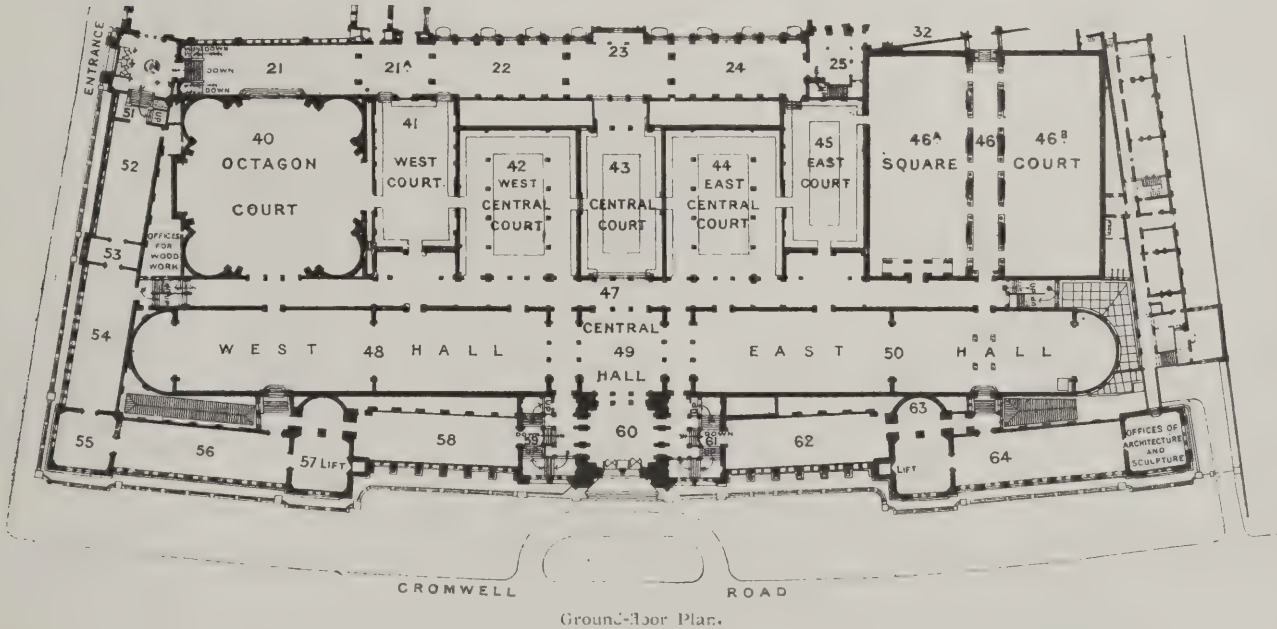

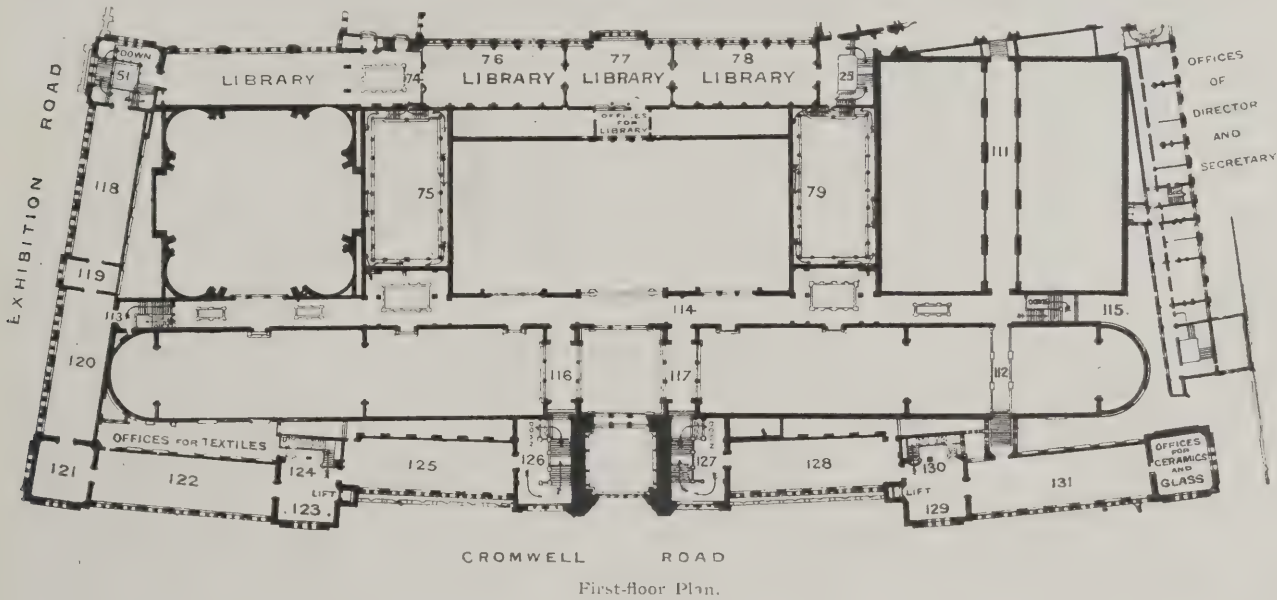

VICTORIA AND ALBERT MUSEUM, SOUTH KENSINGTON WEST CENTRAL COURT. SIR ASTON WEBB, C.B., R.A., ARCHITECT.

THE PLANNING OF ART GALLERIES.

A number of enquiries having reached us with respect to the competition for the new library and art gallery which is to be erected on the site of the old Royal Infirmary at Manchester, we publish in this issue some examples of work of this character that may be of some help to intending competitors. The conditions of the competition draw particular attention to the sculpture gallery of the Art Gallery

yards of which would be occupied by a central court." The site of the proposed new building is perhaps the most important local centre in Manchester. It is four-sided, that to Piccadilly being the longest. Both sides of the site converge rather abruptly towards Parker Street, the thoroughfare at the rear. The site, it is interesting to note, bears considerable resemblance to those of two of the most notable buildings of this class of recent years—the Victoria and Albert Museum at South Kensington, de-

galleries and courts at South Kensington, being intended for exhibition purposes, were intentionally kept perfectly plain; and it will be seen from the plan that galleries of undue length have been avoided. The provision of vistas, and glimpses through the building in passing, afford an added interest. The long gallery gives convenient access to all the courts on each side, and the courts on the north side of the gallery neither oppose barriers to the visitor nor confuse him as though in a maze. Flanking the domed

VICTORIA AND ALBERT MUSEUM. SOUTH KENSINGTON. SIR ASTON WEBB, C.B., R.A., ARCHITECT.

at Aberdeen, of which a view is given on page 108. The following is the wording of the reference in the conditions: "For sculpture the attention of competitors is called to the arrangement at Aberdeen, where a central sculpture court, with aisles all round, and with a balcony over, is provided, surrounded by rooms, containing courts for collections such as Egyptian, Assyrian, Greek, Græco - Roman, Renaissance, Italian, French, German, Celtic, and Modern. 1,500 square yards will be required for the exhibition of sculpture, 600

signed by Sir Aston Webb, and the National Museum of Wales in Cathays Park, Cardiff, the competition in connection with which was gained last year by Messrs. Smith and Brewer. Plans of both these are here given, which, although the buildings are exclusively museums, should be found useful as indicating the arrangement of two very successful schemes. The west central court of the Victoria and Albert Museum is of considerable interest by reason of its skilful combination of the coffered ceiling and an arrangement of overhead lighting. The walls of all the

central hall are the long eastern and western galleries, 50ft. wide, in which the larger architectural exhibits are now placed. The west and east central courts, leading from the central court that forms the main entrance to the older portions of the museum, have their naves and aisles divided by arcades. The plan of the National Museum of Wales is rather less complicated in consequence of its regularity; and the arrangement of the various departments provides a wholly admirable example of formal planning.

NATIONAL MUSEUM OF WALES, CATHAYS PARK, CARDIFF. SMITH AND BREWER, ARCHITECTS.

COMPETITIONS.

The New Australian Capital.

Considerable interest is being manifested in the new Australian capital city, for which a site has been chosen at Canberra, New South Wales, and for which £43,000 has been appropriated by the Commonwealth Government for initial preparatory work. The Minister for Home Affairs of Australia, under whose supervision the capital will be built, states that he will shortly call for designs from all over the world for the federal capital city, and also for the new Parliament buildings, but it will probably be two years yet before the construction of the new city is seriously undertaken.

Leeds Architects and a Douglas Improvement.

Messrs. Percy Robinson and W. Alban Jones, of Leeds, are the successful architects in the competition for the lay-out of the Villa Marina estate on the Douglas sea-front. This estate was acquired by the Douglas Town Council at a cost of £60,000. The accepted design provides for the erection of a diagonally shaped concert-hall next to Broadway, and various reading, refreshment, and other rooms. The grounds will be so laid out as to allow for three main avenues, each having a sea view. It is not thought possible to have the scheme completed for the coming season.

Romford Garden Suburb.

We understand from the Exhibition Committee that the result of the architectural and building competition for houses and cottages to be erected in Gidea Park this summer has been very satisfactory. More than 300 architects submitted designs for houses and cottages, of which about 100 will be erected. The entries for the competition for a town plan in Gidea Park remain open until March 31. The first premium is £100, the second £50, and there is a special prize of £25 for a perspective drawing of part of the proposed lay-out. The assessors are Mr. E. Guy Dawber, F.R.I.B.A., Mr. H. V. Lanchester, F.R.I.B.A., and Mr. Mervyn Macartney, F.S.A., F.R.I.B.A. The competition should prove an attractive one to architects, as the area to be laid out presents no exceptional difficulties, and the work involved is of nothing like so serious or extensive a character as was involved in the recent town-planning competition for 1,300 acres at Ruislip. The rapid development of the Romford Garden Suburb (as Gidea Park is called) affords an assurance that the successful designer may hope to see his plan carried out at no distant date. The area to be planned is approximately 300 acres, intersected by the Romford Golf Course, and the Roman road leading to Romford.

A Swansea Competition.

In connection with the proposed widening and rebuilding of Castle Street, Swansea, the sub-committee of the Corporation recommend (1) that Mr. S. S. Reay, F.R.I.B.A., of Bath, be nominated assessor at a fee of 50 guineas; (2) that the author of the design placed first be paid a commission of 2½ per cent. on the cost (not exceeding £10,000) of the elevation of the buildings; the intention being that such commission is not to exceed £250; and (3) that the author of the design placed second receive a premium of £50; the first and second premiated design to become the property of

the Council. The following suggestions were made respecting the instructions to competitors, drawn up by Mr. Reay:—That as regards the general character of the designs to be invited, the elevation of the buildings at the corner of Castle Street and College Street be adopted, and that photographs of such buildings be supplied to competitors with the instructions; that the front elevation be of stone; that competitors may provide breaks, provided the street be not less than 60ft. wide; that piers be allowed in the designs; the conditions of letting to provide that in the event of one lessee taking more than one plot the Council reserve a discretion to allow a certain degree of latitude with regard to the piers, entrances, etc., so long as the essential features of the scheme are not interfered with.

LIST OF COMPETITIONS OPEN.

FEB. 25. COTTAGE HOSPITAL, ST. AUSTELL.—Architects practising in the County of Cornwall are invited to submit designs for a cottage hospital to be erected on the Trewoon Road, in the Town of St. Austell. The estimated cost must not exceed £1,500. Three premiums, viz., £12 12s., £8 8s., and £5 5s., are offered for the three sets of plans which the committee may select, the premium of the finally selected architect to merge into commission. Designs to be sent to the Hon. Secretary, Mr. Henry Hodge, C.C., Trevarrick, St. Austell, by February 25th, 1911.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Premiums of £15 and £10 are offered. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee E. Pearson, Corbridge.

MARCH 1. FREE LIBRARY, PENISTONE.—Competition limited to architects within thirty miles of Penistone.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 26.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Mr. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125, for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

BOOK NOTICES.

The Cathedral Churches of England.

This is not a book for architects, being rather in the nature of a guide-book to the English cathedrals for general readers; but it is much better done than such books generally are, and seems to be the result of a great deal of careful study of the subject. One object of the writer has been to give such information as is extant in regard to history of the foundation of each cathedral. The characteristics of the various styles of Gothic are sufficiently described in an introductory chapter, though we doubt if they will be practically intelligible to general readers in the absence of any illustrations to explain the wording; a few very small illustrations, just showing what kind of thing is meant, would not have cost much, and would have made all the difference in making the subject intelligible.

No plans at all are given, as to which again we may say that even very small plans would have been better than none; and to describe the buildings without a single plan is a fatal error from our point of view; though we know that popular readers, and publishers of popular books, always fight shy of plans, which seem to puzzle and distress them.

With this indifference as to plan it is of course not surprising that no reference is made to the superiority of Wren's first plan for St. Paul's, nor to the peculiar construction of the dome; and that the author has failed to realise that Peterborough façade is placed in front of a previously commenced less ambitious design, an event undoubtedly provoked by a desire to surpass the new west front of Ely. It is an amateur book in every sense, but it is a great deal better than the general run of amateur books.

The Cathedral Churches of England: their Architecture, History, and Antiquities. By Helen Marshall Pratt. London: John Murray; 1910, 10s. 6d.

Land Law and Registration of Title.

Although it may be painfully true that "the man who is his own lawyer has a fool for his client," it is nevertheless incumbent upon architects, surveyors, and builders to know sufficient of the laws which affect their respective interests to ensure themselves against absolutely groping in the dark in the transactions in which some glimmering at least of legal knowledge may prevent serious misadventure. This book, which modestly professes to be no more than "a comparison of the old and new methods of transferring land," imparts, in the process, a very considerable amount of knowledge that may be turned to good account in professional practice. It is the kind of book which may be read with interest and kept at hand for consultation when guidance is needed; although we are sorry to find that our recommendation of it on the latter ground is to some extent discounted by the absence of an index. The contents, however, are set out analytically.

The plan of the book implies a glance at the history of the land laws, so far as they directly affect the comparison of methods of transferring real estate. The law of real property in England had, by the beginning of the nineteenth century, become extremely complex and obscure. A most exhaustive enquiry into it was conducted by the Real Property Commissioners of 1828, who issued three reports, in which a great number of changes were proposed, of which the most important was the establishment of a register of deeds, which the author describes as "a sort of half-way

house to a register of titles," in which the deeds, though sorted and indexed by the Registrar, are not examined by him. In 1854, a Royal Commission was appointed, and upon their report, in 1857, were successively based Lord Westbury's Act of 1862, "to facilitate the proof of title to, and the conveyance of, real estate," and Lord Cairns's Land Transfer Act, 1875, which superseded Lord Westbury's Act. The Act of 1875, however, was virtually inoperative; and in 1897 the Land Transfer Act was passed, amending the Act of 1875, and providing a State guarantee of title, and making possessory registration compulsory. The system was specifically adopted by the London County Council in 1899. Upon the petition of the L.C.C., the Government in August, 1908, appointed a Royal Commission to enquire into the working of the Land Transfer Acts, and that is as far as the history goes.

The author proceeds to discuss in detail the merits of the old and the new systems, taking in sequence interests in land, charges upon land, wills in their bearing upon succession, settlements, intestacy, the law of mortmain, limited ownership, the uncertainty of titles, vendor and purchaser and fraud, the Statute of Limitations; the "preference of the legal estate," the ideal register, registration under the Land Transfer Acts of 1875 and 1897, a criticism of these Acts, possessory registration, and a summarised description of alternative forms of registration. The author's chief endeavour throughout the book is to show that the root cause of the difficulty of the transfer of land is the complexity of the law of real property and of the transactions permitted, and he advocates the placing of the dealings with land under the care of the State. He believes that the great body of dealers with land will be prepared to put up with the trouble and expense that will be necessarily involved in the formation of the register, "if the land can be thereby relieved of the incubus which now weighs so heavily upon it, impairing its marketability and value—the retrospective investigation of title."

Land Law and Registration of Title: A Comparison of the Old and New Methods of Transferring Land. By Eustace J. Harvey. Pages x.—278, 6ins. by 9ins. Longmans, Green, and Co., 39, Paternoster Row, London; New York, and Calcutta. 7s. 6d. net.

OBITUARY.

Mr. John MacWhirter, R.A.

Mr. John MacWhirter, R.A., who died on Saturday last at his house in Abbey Road, St. John's Wood, was a native of Slateford, near Edinburgh, where he was born in 1839. He exhibited his first picture (at the Royal Scottish Academy) when he was only 14. He then entered the art schools, which were under the direction of Robert Scott Lauder. He was elected A.R.A. in 1879, and R.A. in 1893.

Mr. Herbert Lawford.

Mr. Herbert Lawford, of the firm of Messrs. Lawford and Sons, builders' merchants, of London, N.W., who died on November 23rd last, left estate which has been proved at £43,133 gross.

Mr. James Rushton.

The death is announced of Mr. James Rushton, head of the firm of J. and J. Rushton, slaters and contractors, of Bacup and Littleborough. The firm is widely known and has carried out large contracts, chiefly in connection with mills and factories, in many parts of Lancashire. Mr. Rushton, who was about 60 years of age, had been suffering from an internal complaint for some time.

NEWS ITEMS.

A Partnership.

Mr. Richard H. Owen, Mr. E. M. Whitaker, and Mr. E. Lawrence Hall have joined in practice as consulting engineers at 1, Gresham Buildings, Basinghall Street, E.C. The style of the firm will now be "Whitaker, Hall and Owen."

* * *

A Business Announcement.

The Western Electric Company, Ltd., Norfolk House, Victoria Embankment, W.C., North Woolwich, etc., announce that they have now opened branch offices in the following towns, where their representatives will give personal attention to enquiries for cables, telephones, and electrical supplies, namely:—King's Court, 115, Colmore Row, Birmingham; Standard Buildings, City Square, Leeds; 2, Bank Buildings, Cardiff.

* * *

A Grass Plot in Gray's Inn Square.

The Benchers of Gray's Inn propose during the present year to remake the roadway and pavements of Gray's Inn Square, and at the same time to make certain improvements in lay-out of the central space. It is intended that there shall be a grass plot approximating one-third of the whole area, enclosed by a granite kerb and possibly by a short iron palisade. The plan provides for the planting of a row of trees in the space to be left as roadway, such trees being planted nearer the middle of the square than those which are already in position. Provision is also made on the plan for the statue of Sir Francis Bacon.

* * *

Corporation Action Against an Architect.

The action brought by the Leicester Board of Guardians against Mr. John E. Trollope, one of the architects of the North Evington Infirmary, for alleged negligence and breach of agreement, the question being mainly one of responsibility for the occurrence of dry rot, was concluded in the King's Bench Division on January 25th, before Mr. Justice Channell. In delivering judgment in favour of the plaintiffs, his lordship said that "On the main question he must hold the defendant responsible. He was sorry it was so, because it was a serious liability, and defendant had behaved extremely well." Particulars of the case are held over for a future issue. The amount of damages was not determined.

* * *

Northern Architectural Association and Registration.

In the rooms of the Northern Architectural Association, at 6, Higham Place, Newcastle-on-Tyne, on January 25th, Mr. J. S. Gibson, of London, past vice-president of the Royal Institute of British Architects, delivered an address upon "The Policy of the Royal Institute, and the Advantages of the New Class of Licentiate." The chair was occupied by Mr. H. C. Charlewood (President of the Northern Architectural Association). Mr. Gibson, in the course of his address, explained that the object of establishing the new class of Licentiate R.I.B.A. was to get, if possible, the whole of the practising architects and senior assistants into the Institute, so that that body could proceed immediately with the preparation of a Bill to obtain statutory qualification for architects. The ranks would thus be closed in the same way as were the ranks of the medical and legal professions. The class was opened last March, and would be

closed next March, and up to the present six hundred new members had joined under it, and two hundred other names were under consideration. Before next March it was hoped to bring the total number of new members up to one thousand. The present membership of the Royal Institute was over three thousand.

"Bitumastic" for Tanks.

As this is about the time of year when breweries, ice works, etc., overhaul their refrigerating plant, it is interesting to note that Messrs. Wailes, Dove and Co., 5, St. Nicholas Buildings, Newcastle-on-Tyne, have just completed coating with their patent "Bitumastic" solution and enamel a large tank at Mitchells and Butler's Brewery, Birmingham, which was built by Cutlers of London, for the Linde British Refrigeration Co. This tank is one of thousands that the "Bitumastic" enamels have been applied to with excellent results, both as a protection against corrosion and as a preventive of leakage that might otherwise occur. "Bitumastic" enamels, when once applied, form a permanent coating, and do not in any way taint the water that passes through the tank. For the protection of condenser coils, ice moulds, and all refrigerating plant, "Bitumastic" is recognised as a standard article. Its proprietors secured gold medals at the Franco-British and Japan-British Exhibitions.

OUR PLATE.

Design for St. Paul's Bridge.

The conditions of the above subject, for which the Royal Academy prize was awarded to Mr. L. H. Bucknell, whose drawings are reproduced in our centre plate, were that a new road should be constructed continuing that at the east end of St. Paul's Cathedral, passing over Queen Victoria Street and Thames Street, and crossing the river by means of a new bridge at a given point east of St. Paul's Wharf.

It is suggested that the new road should widen at the approach to the bridge, forming a small "place" surrounded by office buildings in connection with wharves.

THE LIVERPOOL KING EDWARD MEMORIAL.

A meeting of the Liverpool King Edward Memorial Committee was held on January 26th, the Lord Mayor presiding. On the motion of Lord Derby, seconded by Alderman Williams, it was unanimously resolved that the site of the equestrian statue which the citizens are about to erect should be at the south front of St. George's Hall. The commission for the statue was placed in the hands of Mr. Goscombe John, who prepared a model to be placed on the site. It will be remembered that the original proposal aroused considerable criticism, and that a committee of eminent experts was called in to advise on the scheme. A model of an equestrian statue prepared by Mr. Norman Shaw on different lines from those followed by Mr. Goscombe John was submitted to the committee. It was decided to adopt Mr. Goscombe John's scheme as amended by Mr. Norman Shaw. Sir Lawrence Alma-Tadema approved of the amended design.

We understand that the amended scheme, which has yet to be submitted to the Corporation for approval, is likely to be strongly opposed by those who would prefer that this façade of St. George's Hall should be left severely alone; which opposition is supported, we hear, by a protest from the R.I.B.A.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.

The half-yearly general meeting of the National Federation of Building Trades Employers was held in the Balmoral Rooms of the Trocadero Restaurant, Shaftesbury Avenue, on Wednesday, January 25th, when there was an attendance of about 100 members. At the commencement the chair was occupied by Councillor Smethurst, J.P., retiring President, and afterwards by the newly elected President, Mr. J. W. White.

Attention was drawn to a strike that had occurred at Manchester, where members of the National Association of Operative Plasterers ceased work to show their sympathy with the operative plumbers. This action was characterised as a breach of the national agreement subsisting between the operatives and the National Federation, which requires disputes to be referred to a Board of Conciliation; the local branch of the operatives try to justify their action by claiming that they had struck as individuals, and not as a trades union, and had done this by way of protest.

The President said this was a serious matter, as it made the agreement appear to be worthless, and advised the Manchester Association to bring the matter before the Conciliation Board. It is understood this is being done.

Attention was drawn to the proposals under consideration for an improvement in conditions of contract in regard to the money clauses, and the provisions in regard to the employment of sub-contractors, and p.c. provisional sums; and explanations were given as to the steps that were to be taken in regard thereto. It was mentioned that the Newcastle Association had latterly been holding conferences at which conditions of contract and their bearing upon the relations between the parties to them were the subject of illustration and discussion, and that these conferences had proved interesting and instructive, and might with advantage be initiated by other associations.

Some discussion took place in regard to finance, and a proposal to consider the advisability of reducing the contribution rate to the reserve fund was referred to the Administrative Committee for consideration and report.

Attention was drawn to a flagrant case of withholding the final balance on a contract due and certified by the architect as such, and same Committee was requested to look into the matter and advise thereon.

A discussion took place on the question as to whether it was justifiable to enforce a literal interpretation of specifications where the description of materials called for had become obsolete, and instances were given where stone was specified to be obtained from a quarry which had actually become disused and filled up, and where timber was specified which was no longer marketed, the source of supply having become exhausted, and it was contended that it was absurd to expect specifications of this kind to be adhered to, but it was pointed out that legally such specifications were enforceable, and therefore the proper course was for the contractor to refuse to sign such specifications.

Discussion also took place on the desirability of adopting a holiday scheme, so that the holidays of the whole of the staff in builders' offices could be got through in the three weeks comprised in the week prior to the August Bank Holiday, the bank holiday week, or the week following it, instead of extending, as they generally did, through the principal summer months.

The proposal is to be sent to the local branches for further consideration.

The question of affiliation to the International Federation of Building and Public Works Contractors, a newly formed organisation intended to combine the building trade of the principal European countries, was considered, and it was decided to refer the matter to the branches for further consideration. In the course of the discussion it was stated that the benefits which might be expected to result from joining the International Federation were shortly:—Interchange of information and facilities for obtaining special workmen or special goods; a general improvement of the relations between masters and workmen on the Continent due to spread of information, and especially through the example of this country, tending to modify the present aggressive type of Continental socialism and syndicalism, which is now a very bad example to our workmen, and probably is responsible for the recent repudiations by the rank and file of agreements negotiated by trades union officials; the greater consideration which the building industry will enjoy by reason of its international organisation, and the off-set such an organisation will represent to the corresponding workmen's international organisation; and the general trade advantages which accrue to us all by becoming better known to each other.

The Secretary then announced the election of officers for the new Executive Council, and the nominations to the National Board of Conciliation, also to the N.A.O.P. Joint Committee of Appeal.

The report of the new Executive Council was then read, including the recommendations for the election of President and officers; and the names of the Administrative Committee were announced, and were confirmed by the general meeting, as follows:—

President, Mr. J. W. White. *Vice-President*, Mr. Jas. Wright. *Junior Vice-President*, Mr. Frederick Higgs. *Treasurer*, Mr. W. Thomas. *Senior Auditor*, Mr. A. W. Sinclair. *Junior Auditor*, Mr. W. F. Wallis. *Administrative Committee*.

tee.—The following alterations take effect:—*Northern Centre*: Mr. A. J. Forsdike to succeed Councillor W. G. England. *South-Eastern Centre*: Mr. W. G. Crotch to succeed Councillor F. Grimble. *Council*.—*L.C. and N.W. Federation*: Mr. J. T. Duthie (Liverpool) succeeds Mr. W. Bullen; Mr. J. W. Kay (Rochdale) succeeds Mr. Bewley (Oldham). *London Federation*: Mr. C. F. Kearley and Mr. W. Hammond succeed Mr. B. J. Grover and Mr. A. W. Turnbull. *Midland Centre*: Mr. J. H. Walker (Derby) succeeds Lieut.-Col. J. Barnsley (Birmingham). *Eastern Counties*: The Cambridge President succeeds the representative from Great Yarmouth.

Mr. Smethurst, in inducting Mr. J. W. White to the chair, said that the Federation would have in him a most able and assiduous leader.

Mr. J. W. White, acknowledging, said that Mr. Smethurst had approached his work with a determination that had never been surpassed.

The New President's Address.

Mr. J. W. White's presidential address included the following observations: Let me first thank you for the great honour you do me in making me your President. It is an honour, I feel, not only to myself, but especially to that part of the country which I represent, and I might say that I am the first from the Northern Counties Federation to occupy this proud position. I appreciate to the full the responsibility of the position, and it shall be my endeavour to fill it to your satisfaction, and my hope is that when my term of office expires you will find that, emulating those who have preceded me, I have done nothing to betray the trust you are placing in me. On the necessity and benefits of federation I need not attempt to convince you. That is a matter on which we are all convinced. What I think we are most anxious about is, how to instil that idea into many more of the other builders of the country. We should then be, as a body, much more effective in our negotiations, and in obtaining rectification of the injustices from which many members of our industry suffer. If the general body of builders

'MODEL OF AMENDED SCHEME FOR THE LIVERPOOL KING EDWARD MEMORIAL BY R NORMAN SHAW, R.A.

realised fully the advantages of federation our present membership should be doubled. It is only by combination on our part that it is possible to deal with the workmen's organisations, and it is only by the federation of the local organisations that you can cope with the trade unions. By federation you are able to prevent them concentrating their attack upon any particular town or district, and thereby beating us all in sections. It is only by federation you are able to present a massed front, similar to their own. In fact, it is obviously the only way in which you can efficiently face the organisation of the other side. To-day throughout the country we have the Conciliation Boards, with the wonderful result that for the past four years there has practically been no strike in the building trade. This could not have been done without a Federation. We have the National Form of Contract with the Royal Institute of British Architects; the use of which is becoming more general every day. There is the possibility of a contract agreement with the Institute of County and Municipal Engineers, and the certain promise of a recommendation to their members of an arbitration clause in the contracts with municipal authorities. In the legislation which is playing so great a part in industrial affairs, the authorities now look to this Federation for advice on matters concerning the building trade. And all that this Federation has done and is doing in these matters has benefited not only its members, but the whole of the building employers in the kingdom. We have therefore great claims on the membership; which, if it were still more completely representative would be still more powerfully effective, and the more able to better the conditions under which many builders work. We want the added membership with the object of helping builders to help themselves, and with the further object of promoting the general benefit and uplifting of our trade. I mentioned before the matter of the Conciliation Boards. The advantage that this system has been to the employers and the workmen is indisputable; but we must remember that it has been in operation during a period of great depression in the building trade. We have got to see how it will operate during a period of good trade—that prosperous cycle which has been so long delayed, and which some think we are now about to enter upon. Let us hope that the promise of good trade is at length about to be fulfilled, and that when the good time comes the Conciliation Board will be able to settle all differences that may arise, so that employers and employees will be able to reap the full benefit of the prosperity. After referring at some length to the necessity to the Federation of the publicity and advocacy which only an effective official organ can afford, the President dealt with the finances of the Federation, and expressed the opinion that this subject, together with the means of increasing the membership and the influence of the Federation, should engage the early attention of the Administrative Committee.

Mr. Smethurst, replying, said the able and efficient conduct of the Federation was due in no small measure to the energy, initiative, and all-round ability of their secretary, than whom there was none better.

It was decided to forward to the Newcastle Federation a letter of acceptance and thanks for the invitation to hold the next half-yearly meeting of the National Federation in that city.

THE "CHEAP" CHURCH.

Under this heading Mr. W. D. Caröe, F.S.A., F.R.I.B.A., has a valuable article in the January issue of the "Church Builder," in which he renders the profession excellent service by the trenchant exposure of some very prevalent fallacies.

It cannot be disputed (Mr. Caröe writes) that the "cheap" church is entirely of modern origin. Our church-building ancestors, who may be said to have invented and developed for us the type of building which so materially influences our designs and methods, never indulged in unsubstantial work erected chiefly because of its cheapness. They worked under a continuous tradition which had its best development in church buildings, and made them beautiful, substantial, and solid. This statement is quite consistent with the fact that these great builders many times began a work which they had not the means to complete on the scale of magnificence contemplated at the outset. In such cases a simplification of detail took place; a vault perhaps was omitted and a wooden roof erected in its place. But still, the work finally accomplished was never "cheap." Again, there were instances where the building materials more usually desired were too costly to come by owing to difficulties or distances of transit, and they had in such cases to put up with such inferior materials as they could collect on the spot. A large part of their art consisted in the suitable use of such local material. We find notable examples where piers, arches, and every part possible are erected in the roughest rubble masonry plastered over. Dressed stone is used in the smallest possible quantity only where, as in window traceries, it could not be dispensed with. But in such cases the pillars, being comparatively weak in construction, were made stout and sturdy and extra thickness was given to the walls. Here again we cannot accuse them of cheap building.

Cheapness seems to have begun when traditional architecture died out. Some of the churches erected towards the latter end of the eighteenth century were essentially cheap, and cheapness was rife in the early part of the nineteenth. In latter days it has been held in check only by such societies as the Incorporated Church Building Society, and to a lesser extent by the Ecclesiastical Commissioners.

Economy, the author contends, is not necessarily cheapness; this is the distinction to be made clear, for the two are in fact wholly opposed. Experience tells us that cheapness in building involves with unerring certainty dearthness of upkeep. Cheap building is invariably bad building, and for the results of bad building there is no remedy save demolition and starting afresh, when at length funds and patience alike have been exhausted in the fruitless effort to heal running sores.

Now there are, nevertheless, those who promote the building of cheap churches, and influence ignorant committees unable to distinguish between cheapness and economy. As cheapness and vulgarity seem to run in harness, it is not surprising to find the art of self-advertisement, for which the press of to-day affords such ready facility, frequently resorted to in this association. Such advertisement generally takes the form of a promise of a church at so much a sitting (a wholly fallacious standard). In the outcome the promise is frequently unfulfilled, but if

fulfilled, it is only by sacrificing essentials. But whether fulfilled or not, there is the same special puff in the ear of the local reporter, when one of these structures receives episcopal benediction.

A study of churches of this type is worth making. It will be found that each and all of them come in each individual case from a brain which has not two ideas. Precisely the same set of plans and details and the same specification are used again and again, no matter what or where the site or the locality. At the very outset this bespeaks economy of production in favour of the producer, but the lack of it to the payer, because the cost of materials and their lasting qualities vary with the locality. The specification is, moreover, apt to be of the meagrest and most inadequate type, with large provisional sums reserved, so that, in the event of a breakdown in price in any locality, some alternative material like cheap terra-cotta may be substituted, no matter how unsuitable.

As far as granting and approving authorities are concerned, the design manages to run the gauntlet of approval with the narrowest possible margin, but having done so is loudly belauded as having secured what is represented as cordial recognition. As a fact the same stereotyped design is submitted again and again and the same faults are pointed out by granting authorities *ad nauseam* and with difficulty secure correction, though apt enough to appear again in the erected building. It is one of the curious facts connected with the revision of design that the worse the design the more stiff-necked is its author in consenting to amend it.

Again, the class of design we are considering is generally of that garish and showy type abounding in fussy architectural features, thoroughly poor in themselves, but devised to catch the eye of the uneducated in these matters, who predominate on many building committees. It tries, with small success it is true, to found itself upon the past, and is apt to provide capitals and bases and tracery and mouldings, all those features which remove the architecture of the past out of the sphere of cheapness. In trying to give these things cheaply they are given badly, while at the same time matters of more importance are sacrificed.

All the time the money thus squandered might have been spent upon genuine, creditable and economical architecture, the qualities of which may be briefly set forth as follows:—

(1) The use of suitable and, if available, local materials in a simple and direct manner, as best suits their nature. This requires much more art than is usually displayed in the class of buildings we are considering. Appropriate style; in fact, really depends upon it.

(2) The disposition of the materials so as to secure the greatest possible solidity and stability in relation to the amount of material used.

(3) The special adaptation of each design to the site upon which it has to be placed, and also to the needs of the climate and surroundings.

(4) The securing of architectural effect and interest by simple lines and good proportions rather than by elaboration of detail.

Reticence in design and harmony of parts go far to produce the element of solemnity and inspire that sense of reverence which ought to be present in every building devoted to the service of God.

BUSINESS OFFICES, BULAWAYO, RHODESIA FRANK SCOTT, M.S.A., ARCHITECT.

Given good planning and proportion all the above qualities are to-day compatible with sound and economical building. On the other hand it is not too severe to describe as a curse to the community some of the "cheap" churches which are now being foisted upon the unwary. Those who have by trial found them to be what they really are would be doing a good service to the Church in general and the Bishops in particular by freely relating their unfortunate experiences. The sooner work of this class ceases to be encouraged the less money—harder than ever to come by in these days for Church purposes—is likely to be wasted upon that class of "cheapness" which is the reverse of economy, and the negation of good taste.

BUSINESS OFFICES, BULAWAYO, RHODESIA.

The building shown in the accompanying illustrations has recently been erected as offices for Messrs. Johnson and Fletcher, engineers and machinery agents, and at the rear are machinery and other stores, with yard, etc.

The base of the building up to window sills is of rock-faced grey granite, in random sizes, above which level the walls are of brick plastered and whitewashed. The steps to entrance door are also of grey granite, and the roof is covered with Marseilles tiles.

The external design is founded upon a study of Dutch Colonial work, which seems

most suitable, not only to surroundings, but also to local materials. Expense generally forbids the use of granite throughout; and local bricks are hardly good enough to leave exposed. A plaster treatment is therefore in most cases forced upon the architect, and in the traditional type of building is found such a treatment, which, seen in South Africa with the strong bright sunlight upon it, seems perfectly to harmonise with its surroundings, and to have a charm which no mere copies of English or European styles ever have, the latter always seeming to be foreign importations and to be out of character with the scenery and people. The above remarks are meant to apply to the old Dutch Colonial examples, the writer not presuming that they have full force when considering the modern example shown in the accompanying illustrations.

The windows are casements in solid frames, and are treated with "Solignum," the same thing being applied to the internal woodwork generally. The front door, with its lobby and inner swing doors, are of teak oiled, and the counter and interior fittings have been uniformly constructed of stained poplar, and made to the architect's details. The internal walls are lime plastered and finished cream colour, while the ceilings are of steel stamped with an "all-over" pattern, and painted white with a flatted surface. The cornices are also painted in wood. The whole of the hardware was supplied by Messrs. Hope, of Birmingham. The architect is Mr. Frank Scott, M.S.A., Bulawayo, Rhodesia.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Concreting in Cold Weather. Although, in this country, hard winters have, during recent years, become remarkably rare, it can hardly be supposed that they have disappeared for ever. We may get, yet again, and perhaps immediately, long periods of severe frost, during which, for lack of knowledge of what can be and is being done in other countries to meet such conditions, building operations are apt to come to a complete standstill. The following account of the measures that may be taken to avert such delays may possibly, therefore, admit of an early application, or at the least will be useful for reference.

As the example of the proper handling of winter work the experience of a contractor during the construction of a reinforced concrete bridge is recounted. The bridge consisted of three 3-centred arches having a clear span of 110 feet each. While the arches proper were being concreted, the weather turned quite cold, from 12 to 15 ins. of ice forming on the river. Nineteen days after the centre span was concreted, a warm rain set in, resulting in a flood which carried away the false work and centering for this span, but did not result in any damage to the bridge. The materials for the concrete were thoroughly heated, being delivered to the mixer at an average temperature somewhat above blood-heat, and as soon as the concrete was deposited it was protected with a covering of tar paper and boards. The proper handling of the work in this case probably prevented the total destruction of the middle span when the forms were accidentally removed long before the intended time.

The Precautions Necessary. The proper precautions necessary to insure satisfactory results with concrete during freezing weather depend very much upon the class of construction, large plain mass work such as retaining walls and abutments not requiring the same care and protection as thin walls, columns, beams, and floor slabs. Elaborate and expensive plants for heating the materials and protecting the work have been constructed and successfully used on important work, but the additional equipment considered necessary for winter work is really comparatively limited, consisting simply of a sufficient amount of canvas for housing in or covering the work, salamanders or some other form of heaters for maintaining a temperature above the freezing point, and some provision for heating materials.

Heating Apparatus. Half-cylinders of sheet steel set directly upon the ground in the form of an arch make a simple form of sand-heater, as also do lengths of metal culvert pipe closed at one end and provided with a short piece of smaller pipe for a flue. Sand and stone may be heated by piling directly upon pipe coils

supplied with steam or by covering with tarpaulins and applying the steam directly to the material to be heated. Where the materials are delivered in cars, excellent results can be obtained by this latter method. For heating water, the common practice of relying upon a steam pipe placed in an ordinary barrel is not to be recommended. The water is generally used too fast to permit of its being properly heated by this method. A suitable tank should be provided, the water being heated by means of a coil supplied with steam from the boiler supplying the mixer engine, or from one erected for this purpose. The size of the tank will, of course, depend upon the amount of water needed, and the time that is required for heating it.

Alternative Methods.

Work can be successfully carried on during freezing weather by either one or both of two methods: heating the concrete materials and then protecting the work until it has had a chance to harden, or, for temperatures but little below freezing, by lowering the freezing point of the concrete. This latter method is probably the simplest and cheapest, but not the best, and consists, in American practice, of adding to the concrete some substances that will reduce its freezing point. Only those substances that have no effect on the strength and durability of the concrete can be used. Ordinarily salt is most commonly used for this purpose; and experiments indicate that while the addition of a limited amount of salt retards the hardening somewhat and lowers the initial strength, the ultimate strength of the concrete is not affected by its use. Even when salt is used, it is important that the aggregate be free from frost, as it is impossible to mix properly such materials. Approximately one per cent. by weight of salt to the weight of water is required for each degree F. below freezing, but more than ten per cent. of salt should not be considered safe, and this amount is not effective for temperatures lower than 22 degrees F. Calcium chloride has been used in place of salt for the same purpose, and apparently gives very good results. In one case where commercial muriatic acid was used to prevent freezing, a small amount of acid being added to the mixing water, the results obtained were not entirely satisfactory, and the present unsatisfactory condition of the concrete, both as to colour and strength, is undoubtedly due to the use of the acid. At any rate, the use of acid in this connection is not to be encouraged. To insure satisfactory results during cold weather, the material should be heated and the work protected until it has attained sufficient strength to withstand the action of frost, either the water, sand and water, or sand, stone, and water should be heated. Heating the materials accelerates the rate of hardening, lengthens the time before the concrete becomes cold enough to freeze, and, in temperatures but little below freezing, will insure the hardening of the concrete before it can be damaged by freezing.

Treatment of Heavy Work. For heavy mass work, thick walls, abutments, etc., it is not necessary to heat the sand if it is dry and free from lumps of frozen matter. The water, however, should be heated, and if the concrete goes into place unchilled it will harden quite rapidly, as mass work retains its initial heat for a long time and additional heat is generated during the process of hardening. If the forms are tight and made of heavy material it will be necessary to protect the top or exposed surface of the work. This may be accomplished by covering with tarpaulin and applying a jet of steam, or by covering with boards, building paper, or some other suitable material, and applying a thick blanket of straw or manure. A thickness of from 10 to 12 inches of manure laid on paper or canvas will, if kept dry, protect work from freezing for days at a temperature as low as 10 degrees F. Manure should not be placed directly upon the concrete, however, as it is very apt to discolour the work, and in some cases is thought to have caused a slight disintegration of the surface coming in contact with it. As an additional precaution for keeping the work from freezing through the forms, a covering of building paper furred an inch or two from the forms has been found to be effective. Actual tests in practice have shown a difference in temperature of 15 degrees between the outside air and the space between the paper and the forms.

Inspection of Winter Work. Careful inspection of winter work is necessary before removing the forms, and it must be remembered in this connection that frozen concrete, which, upon thawing, has but little strength, closely resembles thoroughly hardened concrete in appearance, and when broken frequently shows a fracture through the aggregate. To prohibit placing of concrete when the temperature is near or below freezing, as is frequently done in specifications, causes unnecessary delays and imposes an unjust hardship upon the contractor. If concrete work is properly handled it may be successfully carried on irrespective of weather conditions. The cold weather clause in specifications, instead of prohibiting, should be so written as to permit of construction during freezing weather, provided proper precautions, which should be specified, are taken.

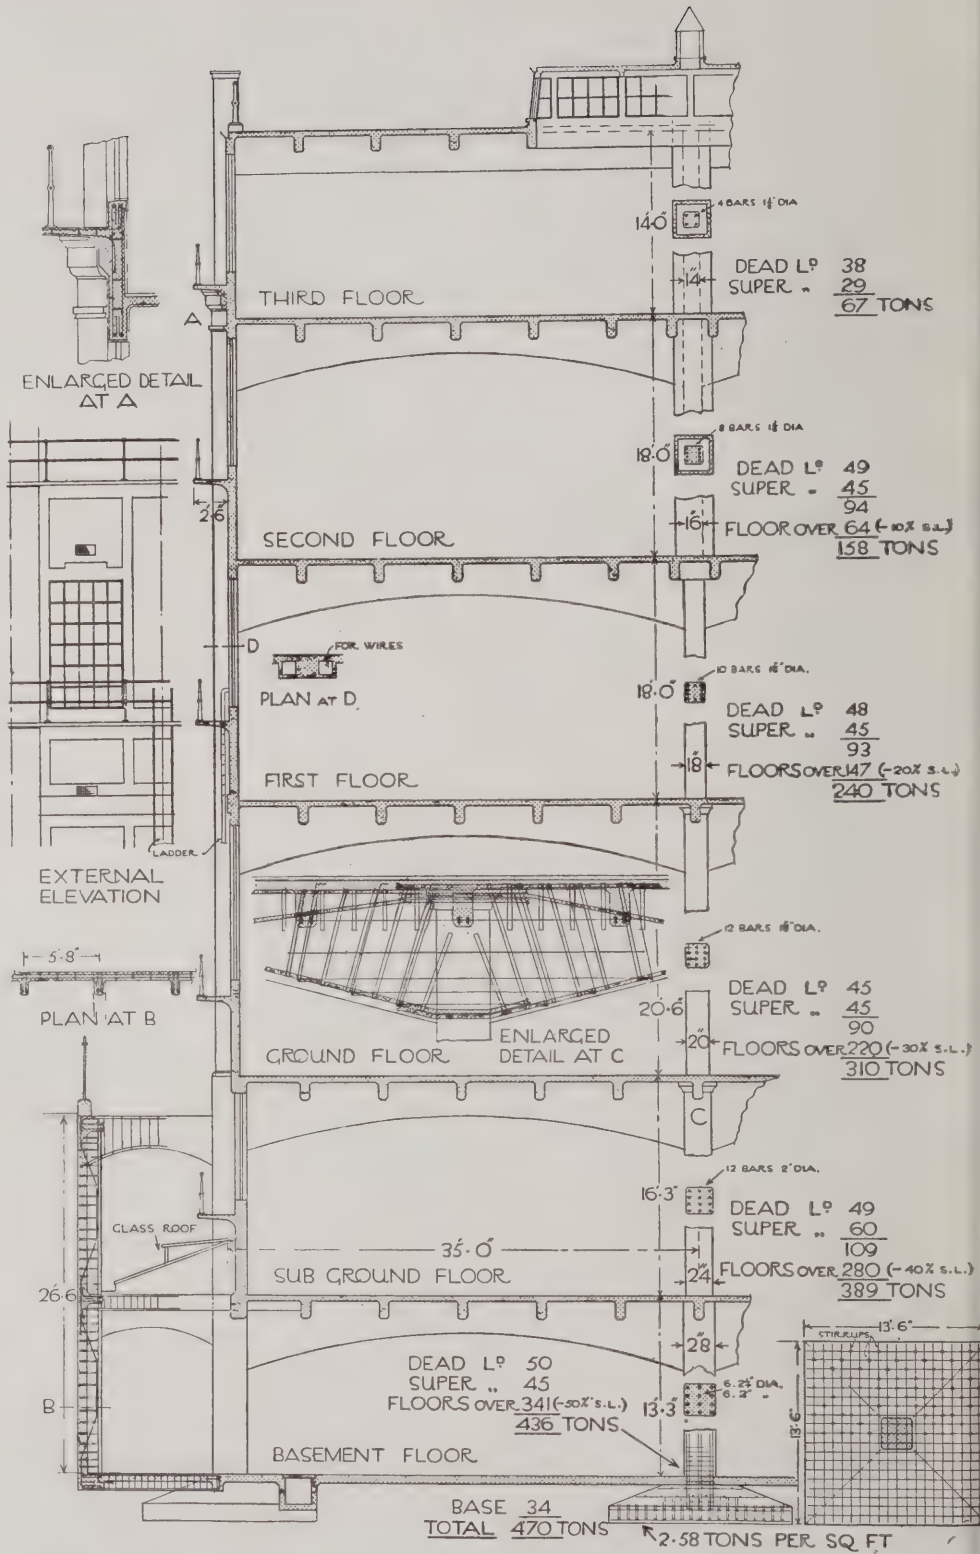

What is a Beam?

A correspondent signing himself "Licentiate" forwards the following interesting communication:—"When is a beam not a beam? This thought comes to me after the discussion upon Sir Henry Tanner's exceedingly instructive lecture on the new General Post Office. For at least three distinct views of the 'arched beam' there used were taken by as many gentlemen during the discussion. (1) The president assumed it to be a beam with the strength missing

where it was most required; (2) Professor Adams apparently took it to be an arch; whilst (3) Sir Henry Tanner afterwards said it had apparently been designed on cantilever principles. Whether one and all are correct it is not for me to say. It is always assumed that the concrete is strong enough in compression and only requires strengthening in tension by steel bars, etc. Yet if we apply this to (1) we find all the tension bars at the centre above the neutral axis, viz., in the compression area; or to (2) as an arch, all parts are in compression and therefore (theoretically at least) no reinforcement is necessary; or (3) as cantilevers the lowest portion is in compression—such stress being greatest at the abutments; yet this part of the beam is most reinforced. All this is so puzzling to a novice that one would like to have a fuller knowledge of the theory of these 'arched' beams."

The accompanying sectional diagram will be of assistance in reconsidering the points raised, as it shows the loads for each floor, as well as the details of construction. It may be useful, also, to recall a few of Sir Henry Tanner's references. "The retaining walls," he said, "vary from 7in. to 8in. thick, strengthened by beams and counterforts, and are, in fact, floors placed on end. They are maintained in the vertical position by the arched beams or struts which are continuations of the main floor beams. The reinforcement in the wall slabs consists of 7-16th in. diameter horizontal rods spaced at from 4in. to 10in. centres on the inside of the wall, and 5-16th in. diameter rods on the outside spaced at from 8in. to 24in. centres. There are also vertical rods of 5-16th in. diameter spaced at 8in. centres, and stirrups are used. The vertical counterforts, 14in. by 7in., arranged about 5ft. 6in. apart, are supported by horizontal beams, and are designed in a similar manner to the ordinary floor beams. The former have two bent and two straight bars of 1in. diameter, and the horizontal beams are similarly reinforced, but with bars of varying diameters. . . The arched main beams are 2ft. 6in. in depth at the centres, and 5ft. 3in. at the haunches, the thickness being 10in. The depths include the floor slab. The reinforcement for these beams when of 35ft. span consists of two 1½in. diameter bars at the top and four 1½in. or 2in. bars at the bottom. Two of these follow the curve, and when they reach the haunches pass horizontally through the column, and then follow the curve of the adjoining beam, passing 2ft. into it; the other two bars are horizontal for a third of the span, then bend up at a slope till within 3in. of the top, and are carried through the column and 2ft. into the next beam as before. . . For larger spans and the heavier super loads the reinforcement is varied accordingly, and the beams in the ground floor are 3in. deeper in the centre, and 2in. thicker, the maximum being the centre 45ft. spans. The secondary or floor beams are 8in. wide and 10½in. deep, including the floor slab, and are spaced at about 5ft. 10in. centres."

It will be seen that the dead and super load of one bay as sustained by such beams is 90 tons, and that the beams were reinforced with 4-2 inch bars, being 2ft. 6in. deep at centre. Suppose we take the leverage arm to be 26 inches, we get a moment of re-

NEW GENERAL POST OFFICE, LONDON: SECTION OF A COMPLETE BAY.
NORTH TO SOUTH.

distance of $26 \times 3.1410 \times 4 \times 7\frac{1}{2} = 2,450$ in.-tons. We see from this that the bending moment has been taken as about $\frac{Wl}{15.5}$ which is open to justification. Therefore, the construction is sufficiently deep to act as a beam at the centre. Our view is that the construction is of continuous beams, and that near the supports where the forces of compression and tension are reversed, the depth is increased to provide for the reduction in area of concrete in compression, the beam at this point being practically rectangular, whereas at the centre

of the span it was tee-headed. In continuous beams cantilever and suspended beam action is simulated, and often the beam is spoken of loosely as a cantilever and beam, but there is a distinction. Sir Henry Tanner's statement was in a way correct, but, of course, to appreciate it we must understand the design of continuous beams. By courtesy of the Royal Institute of British Architects, we are able to give the above illustration, from the issue of the "Journal" containing the report of the paper.

STRESS IN ANGLE CLEAT RIVETS.

By EWART S. ANDREWS, B.Sc.Eng., Lond.

In the case of the rivets in an angle cleat as commonly used for connecting together I beams in constructional steel-work, we have an interesting example of an eccentrically loaded riveted joint. The designer does not, of course, calculate the strength of these rivets in the ordinary case, because such connections are to a large extent standardised for a certain minimum length of beam; but in special cases calculations have to be made; and, as the eccentricity of the load causes considerably heavier stresses on the rivets than if the reaction be merely divided between them, it is usual to allow for the eccentricity in the following manner.

We will first consider the general case, and then apply our method to a particular numerical example.

General Case.

Let 1, 2, 3, 4, 5 . . . Fig. 1, represent a number of rivets connecting a plate A to a plate B, and let P be the load transmitted from one plate to the other.

Then if X is the centre of gravity of the rivets, and P is at a distance x from X, it is clear that we may place at X forces equal to, and opposite to, P, as in the case of an eccentrically loaded column, thus obtaining a couple of moment M=Px, and a central load P.

The central load P may be divided equally between the rivets, thus giving a force F on each.

The moment Px may be divided up between the rivets as follows:—

Let the load on a rivet due to the moment be proportional to the area a of each rivet, and to its distance r from the centre of gravity X.

Say load on each rivet=k.a.r. where k is a constant,

Then moment of load on each rivet

=load x r

=kar² (1)

Total moment of loads on rivets= moment P x

=Σ(kar²)=k (a₁r₁²+ a₂r₂²+ . . . A_n r_n²)

In nearly every case the area of rivets a will be constant ∴ putting ka=s we have

Total moment =Px=sΣr² (2)

where s=load at unit distance from X.

∴ s= $\frac{Px}{\Sigma r^2}$ (3)

Then load due to eccentricity on any particular rivet=W=s.r

This will be called the moment-load.

Then the resultant load R on any rivet will be the resultant of the loads F and W, and can be found simply by the usual graphical method. Fig 1 shows the construction applied to the rivet 3. The resultant of the various loads R should then come equal and opposite to P. This resultant can be found nicely by the link and vector polygon construction, and provides an interesting check of the accuracy of the calculations.

Numerical Example.

We will now take the case shown in Fig. 2 of the cleat given in the Handbook of Messrs. Dorman, Long and Co., Ltd., for a 16in. by 6in. standard I beam with a minimum span of 18ft., the rivets being of 3/4 in. diameter. The safe uniformly distributed load given for this span and beam is 25 tons, so that the reaction at each end will be $\frac{25}{2}$ = 12.5 tons, and half of this will be carried by each angle, or the load P will be 6.25 tons.

Fig 1.

First find the position of the centre of gravity of the rivets. It is clearly on the horizontal line through the rivet 3, and its distance from the line 1, 3, 5 is obtained by moments thus:

$$5d = 2 \times 2\frac{1}{4}$$
$$\text{i.e., } d = \frac{4.5}{5} = .9 \text{ in.}$$

Then we tabulate the dimensions as follows:—

No. of Rivet.	r.	r ²
1	4.58	21.06
2	2.62	6.88
3	.90	.81
4	2.62	6.88
5	4.58	21.06
		Σr ² = 56.69

$$\therefore s = \frac{Px}{\Sigma r^2} = \frac{6.25 \times 3.15}{56.69}$$
$$= .348 \text{ tons.}$$

The moment load will clearly be a maximum on rivets 1 and 5, and will be equal to

$$W_5 = .348 \times 4.58 = 1.59 \text{ Tons.}$$

Fig 2.

The direct load F on this rivet = $\frac{6.25}{5}$
= 1.25 tons.
Therefore resultant load = R₃ = 2.20 tons
[From Fig. 2.]
Now bearing area of a 3/4 in. rivet in a 3/8 in. plate = $\frac{3}{4} \times \frac{3}{8} = \frac{9}{32}$ sq. in.
Bearing stress on rivet = $\frac{2.20 \times 32}{9}$
= 7.82 tons per sq. in.
Area of a 3/4 in. rivet in section
= $\frac{\pi}{4} \times (\frac{3}{4})^2 = .442$
∴ Shear stress on rivet = $\frac{2.20}{.442} = 4.98$ tons per sq. in.

The above calculation shows that the rivets are stressed just about up to what is commonly taken as a safe working stress for rivets in shear, viz., 5 tons per sq. in. The importance of allowing for the eccentricity of the stress will be clear from this example, because the resultant maximum stress on the rivets comes nearly twice the value which would have been found if the eccentricity had not been taken into account.

CANAL BRIDGE AT BLACKBURN.

A successful test has been carried out on a new reinforced concrete bridge over the Leeds and Liverpool canal at Moor-gate St., Blackburn. The new structure was erected to succeed an existing arch. Both the width of the roadway and the span of the bridge were greatly increased in order to afford additional facilities to the traffic of both the road and the canal. The span is now 40ft., and the width of the roadway 37ft. between parapets.

Owing to the situation of the bridge, exceptionally heavy loads had to be provided for, and the test consisted of a moving load of not less than 65 tons. The test was made with a 14-ton traction engine drawing an 18-ton four-wheel bogey (No. 1), and a 15-ton engine drawing a 32 ton wheel bogey (No. 2).

The test was first made by passing No. 1 engine and bogey over the bridge, the load being 32 tons. Bogey No. 1 was then left on the bridge, and engine and bogey No. 2 were passed over alongside it, the total load being, as already stated, 65 tons. In neither case was there the slightest measurable deflection, and the vibration during the passage of these exceptionally heavy loads was practically imperceptible.

This bridge was designed by the Patent Indented Steel Bar Co., Ltd., and was constructed under their supervision by Messrs. F. Mitchell and Sons, contractors, Manchester; indented bars being used in the reinforcement throughout. The structure affords an interesting example of the advantages of reinforced concrete, as, in addition to the economy effected, the rise allowed was very slight, only 1ft. on a span of 40ft., owing to the necessity of avoiding interference with the road gradient. Obviously it would have been difficult if not impossible to construct a bridge in any other material which would have given such flat gradients in the roadway, and at the same time such headway above the canal.

The engineer for whom the work was constructed was Mr. W. Stubbs, A.M.Inst.C.E., Engineer to the Corporation of Blackburn, under whose personal supervision the test was carried out.

THE CONCRETE INSTITUTE
TRANSACTIONS.

Volume II. (Part 2) of "The Concrete Institute Transactions and Notes" opens with an account of the visit to Paris by a deputation invited by the Institute to examine certain reinforced concrete structures which had been in use for a number of years, and to find out whether or not the steel had been well preserved, and what precautions, if any, had been taken to ensure this preservation. The visits were arranged by M. Rabut, Chief Engineer of State Railways, and occupied two days—April 8 and 9, 1910. The first visit was to the church of St. Jean de Montmartre, Paris, in which the columns and arches are of reinforced red brick casings

enclosing a reinforced concrete core, while the roofing consists of three vaults, built partly of brick and partly of reinforced concrete; the floor and the arching of the belfry tower and the ornamental balustrades being built entirely of reinforced concrete. The reinforced concrete work seems to be covered with a rendering of very strong cement mortar. No sign of deterioration from rusting was perceptible. The architect, M. de Bandon, conducted the party over the church, the work in which had been carried out by M. Cottancin, who is the author of the system of reinforcement employed. The roofing of the Canal St. Martin was inspected with similar negative results as regards rusting. A three-storey house built fifty-eight years ago by François Coignet has a roof consisting of a slab of

reinforced concrete, which M. Edmond Coignet, who organised the visit, was so kind as to break open in order that the deputation might inspect the bars, which were found to be perfectly clean, with no sign of rust. The Paris sewage disposal works were next visited. They were constructed about 1893, and appear to be in excellent condition. The same observation applies to a cut-and-cover tunnel containing the rising mains from the pumping station at Colombes, where the construction works were erected fifteen to seventeen years ago.

M. Hennebique's house, 1, Rue Danton, Paris, and his country-house at Bourg-la-Reine were next successively visited. They were built respectively in 1899 and 1904, and are both excellently preserved. The country-house, as illustrated in the "Transactions," is a curiosity, not to say a freak, of design. Other works visited were a reservoir at Billancourt, erected in 1899, and the widening of the Paris-Auteuil Railway; and in each instance the work was found to be in wholly satisfactory condition. It is noted that in all these works the concrete used appeared to be of excellent quality, dense and fine, in many cases the aggregate consisting wholly of gritty sand, without any stone.

Other visits recorded were to the new Chingford Reservoir Works (of which the illustrations include a folding map), to the British Improved Construction Company's works at Fulham; and to Southampton Docks. The eighth to the eleventh meetings of the Institute are reported, and the papers included are: "Notes on the Le Chatelier Boiling Test of Portland Cement," by Mr. D. B. Butler; "The Effects of Sewage and Sewage Gases on Portland Cement Concrete," by Mr. Sidney H. Chambers; "Reinforced Concrete Bins," by Mr. H. Kempton Dyson; and "The British Aluminium Company's Works at Kinlochleven," by Mr. A. Alban H. Scott. In each instance the discussion (which is always remarkably keen at the Concrete Institute) is scarcely less valuable than the paper.

The Concrete Institute Transactions and Notes. Volume II. (Part 2). Published at the Offices of the Concrete Institute, 3, Waterloo Place, Pall Mall, S.W.

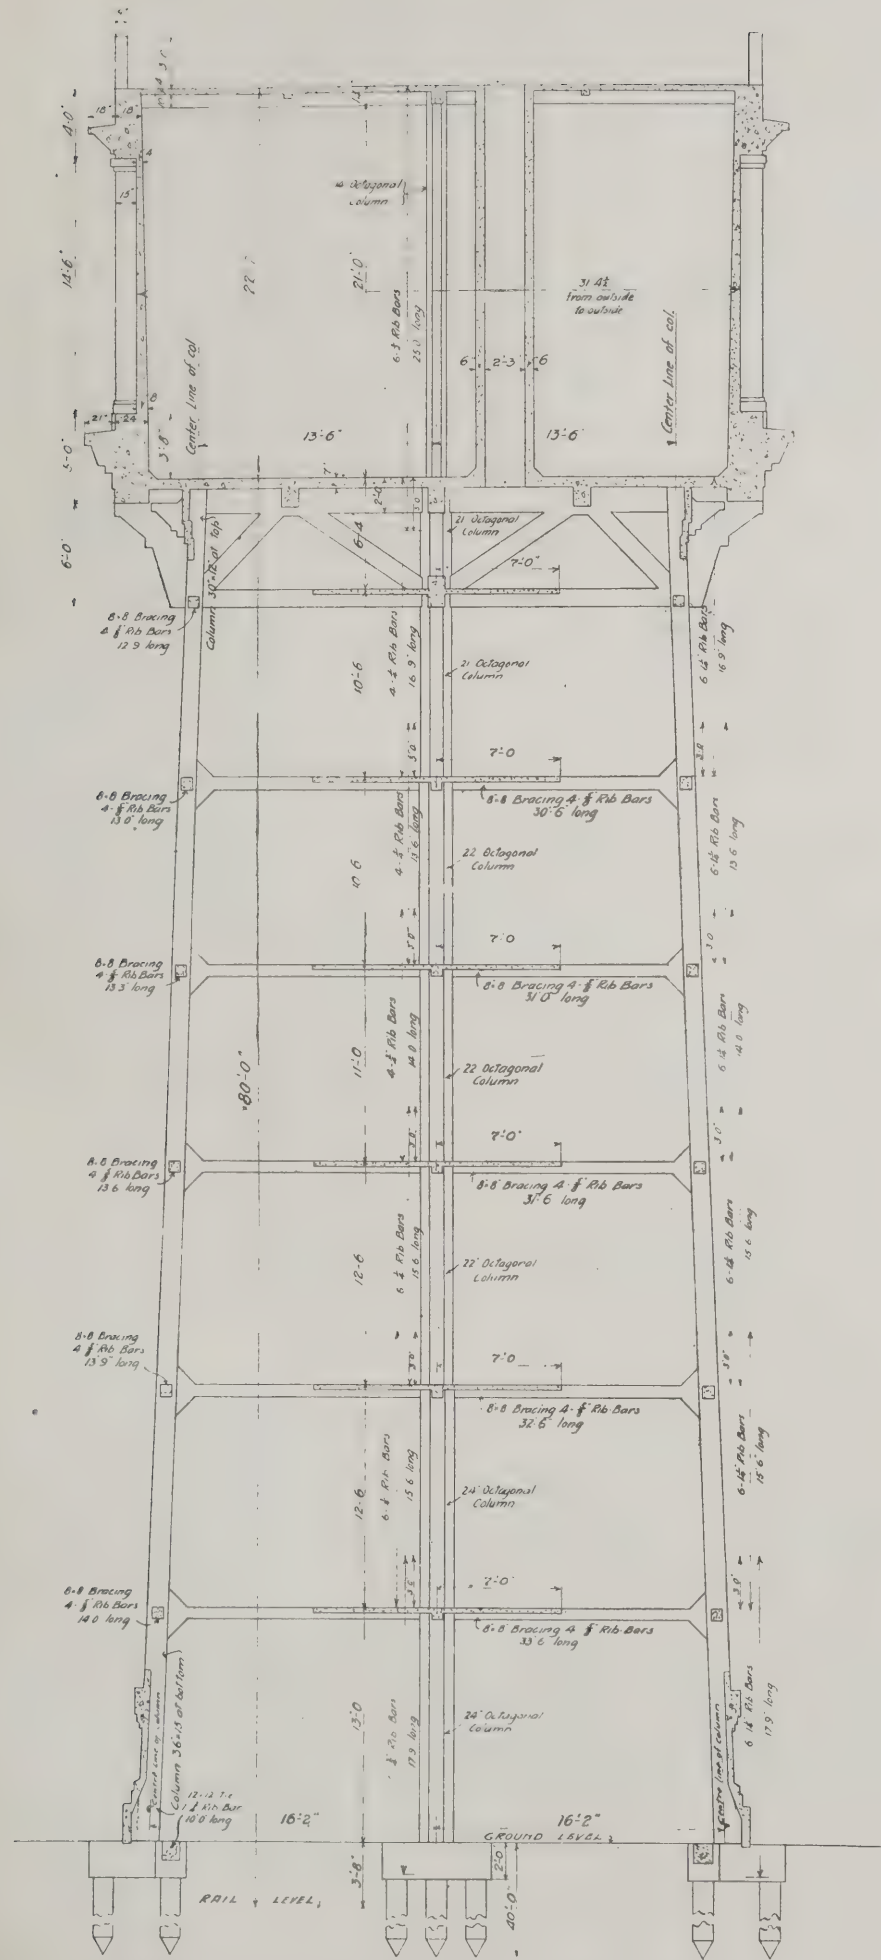

REINFORCED CONCRETE
WATER TOWERS AT YORK.

Two interesting examples of reinforced concrete elevated water towers have recently been completed for the North Eastern Railway Co. at York Railway Station, to the order of Mr. Bengough, Chief Engineer to the Railway Co. The holding capacity is, in one case, 100,000 gallons, and in the other 20,000 gallons. The 100,000 gallon tower, which stands some 101ft. high, is octagonal on plan, with an internal diameter of 32ft. 4in., and a depth of 21ft., the total weight of water contained in the tank being some 450 tons. The tower is supported on eight external columns, and one internal column, reinforced with Kahn rib bars of $\frac{3}{4}$ in. and $\frac{1}{2}$ in. sections, and is braced at intervals varying from 14ft. to 12ft. 9in. Platforms are erected at the level of the bracing to permit of the necessary ladders giving access to the tower. Boring operations having proved the ground to be unsatisfactory, three 40ft. Truscon piles were driven under each column.

The photograph shows a quality that previous experience of similar structures had hardly led one to expect—namely, a definite approach towards beauty of archi-

REINFORCED CONCRETE WATER TOWER AT YORK, FOR THE
NORTH-EASTERN RAILWAY COMPANY.

100,000-GALLON WATER TOWER, YORK: SECTION.

tectural treatment. This quality is the more admirable from its organic spontaneousness. It arises from an economic and adroit adaptation of the materials to the circumstances, and is altogether very suggestive of the architectural possibilities of reinforced concrete, even where the subject seems at first sight to be unpropitious.

The 20,000-gallon tower is hexagonal on plan, with an internal diameter of 20ft., and a depth of 10ft., and is covered with a light flat concrete roof, the weight of the water contained in the tank when full being 90 tons. This tower rests upon a foundation of two Truscon piles 40ft. long under each of the columns. There are six columns in all, 16ft. by 16ft. at the bottom, and 16ft. by 12ft. at the top, based at intervals of 14ft. The bracings are 8ft. by 8ft. reinforced with $\frac{3}{8}$ in. bars. The bracing platforms are arranged for the inclusion of a ladder giving entrance into the tank through a circular manhole. The tanks were tested by filling up with water. This operation commenced, in the case of the 100,000 gallon tank, on June 17th, and the 20,000 gallon tank on August 23rd, and was finished on the 21st June and 28th August respectively. In the result, the tanks were both found to be watertight, without the use of any special waterproofing, and were satisfactory in other respects.

The Trussed Concrete Steel Co., Ltd., were the consulting engineers, and the whole of the reinforcement was on the Kahn system. The work was under the control of Mr. Malt, acting for the engineer of the railway.

A STANDARD SPECIFICATION.

Messrs. J. H. Tozer and Son, Ltd., of York Mansions, York Street, Westminster, send us a copy of their "Standard Specification" for the execution of reinforced concrete work on the "Lock Woven Mesh System." The following are some abstracts from it:—

MATERIALS.

The cement must be of the best quality British artificial Portland cement of an approved make and guaranteed to conform with the specification of the British Standards Committee of slow-setting cement.

The sand to be clean, sharp, and coarse river or approved pit sand of various sized grains up to particles which will pass $\frac{1}{4}$ in. square mesh, but which at least 75 per cent. shall pass $\frac{3}{8}$ in. square mesh. It must be free from all ligneous, organic or loamy matter.

The aggregate must be of Thames ballast screened from sand and washed or broken brick or some other hard clean material, free from all sulphur and other impurities. The choice of aggregate to rest with the engineers, and to be determined by them on account of different aggregates being more suitable to one class of construction than another. No aggregate shall be larger than that which will pass a $\frac{3}{4}$ in. ring unless otherwise sanctioned by the engineers.

The proportioning of the concrete to be determined by the engineers, and carried on in a manner approved by them.

WATER.

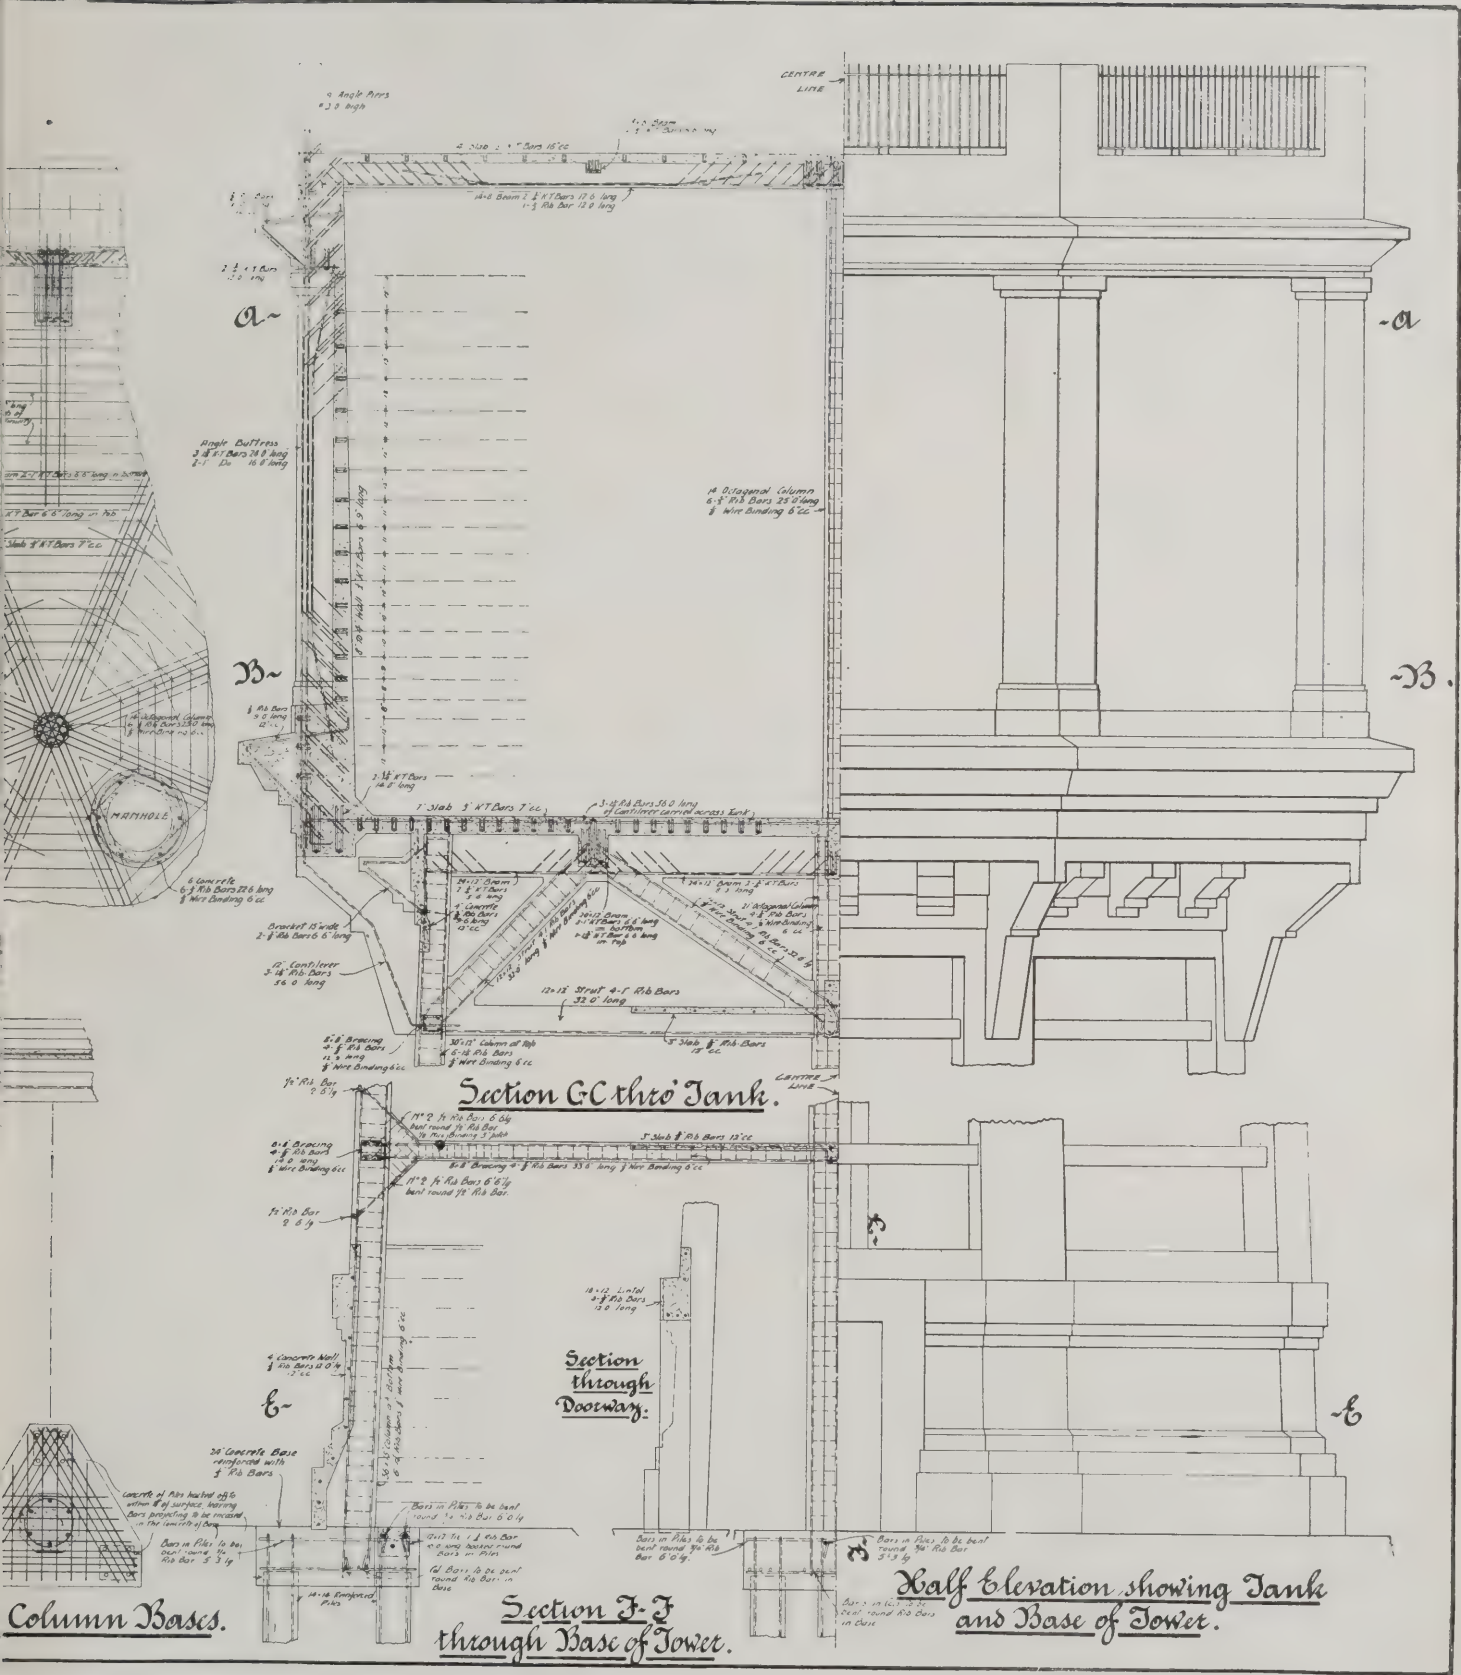

The water to be clean and clear, either from the mains or from springs. No stagnant, salt, or impure water must be used. About 25 per cent. of water should be added to the mixture, but this quantity must not be made a hard and fast rule, as various aggregates absorb different amounts of water, and the dryness of the atmosphere and the centering affect the matter. The aggregate should always be wetted before the cement is added.

MIXING.

When the magnitude of the contract permits, all mixing should be carried out by a suitable mixing machine. A continuous mixer that automatically proportions the materials is preferable.

The concrete when mixed should be a semi-liquid mass that will quiver under the blow of the rammer. When consent is given to mix by hand it shall be done as follows:—A clean level platform to be provided which shall be swept clean and watered after each batch is removed. The necessary quantity of the three materials shall be measured in separate boxes; the cement shall be measured 5 per cent in excess of the specified proportion. The materials shall be mixed at least twice in a dry state, then the necessary amount of water added

A CONCRETE SOUNDING BOARD.

A bandstand with a sound-reflecting roof built entirely of reinforced concrete is in use in Wiesbaden, Germany. The ground plan of the structure is 46.0ft. wide and 37.8 ft. deep, the sides being tangents for about 18.4 ft. from the front, joined by a circular curve with a radius of about 20 ft. The arched and domed roof rests on vertical walls about 10½ ft. high above the platform. Vertical sections parallel with the front of the pavilion being taken, the radius of the roof will be found to increase gradually from back to front until at the front the semi-circular arch span is 40ft. in the clear.

Since the front is open the structure could not be designed as a dome, but was figured in arch strips parallel with the front. It was found that the dead load of the roof, the snow, and the most unfavourable wind load, gave a considerable horizontal thrust, which was designed to be taken by a horizontal beam system running around the pavilion, consisting of straight beams on the two sides and a curved beam at the closed end. The moments in these beams with various conditions of loading were investigated, and reinforcement provided accordingly. The reactions for this horizontal system were obtained by supporting the forward end of each straight beam as supported by its rigid connection with the circular beam.

The arched roof is 4ins. thick at the crown, 6ins. thick at the horizontal skewback beam, and is reinforced with circumferential rods near both extrados and intrados. The two layers are wired together at intervals, and are supplemented by longitudinal rods to act as distributors and take care of the temperature stresses. Forming a rim on the front of the roof is a stiffening arch which serves no other purpose than to take the thrust of the horizontal skewback beams.

The straight and curved skewback beams are carried on concrete columns about 7ft. 3ins. on centres, between which are thin reinforced curtain walls.

It is stated that in the single test for the acoustic qualities to which the structure has been subjected the carrying power of the sound and the blending of the instruments was excellent.

The structure was built under the direction of the city's building commissioner, Herr Grun, and was detailed and constructed by Rheinische Betonbaugesellschaft, Ltd., of Mainz.

OUTDOOR BAND STAND WITH REINFORCED CONCRETE SOUNDING-BOARD, AT WIESBADEN, GERMANY.

100,000-GALLON WATER TOWER AT YORK PORTION OF PLAN SHOWING TIES IN TOP OF TANK.

and mixing continued until the whole is of a uniform colour and of the consistency stated above.

No hard and fast rule shall be employed of mixing twice wet and twice dry. A competent and trustworthy ganger must be in constant attendance on the mixing platform.

REINFORCEMENT.

All steel bars used for beams and posts should have a tensile strength of not less than 60,000 lbs. per square inch of section, and an elastic limit of not less than 50 per cent., nor more than 60 per cent., of the ultimate tensile strength, with an elongation of not less than 20 per cent. in a length of 8 ins. Any bar must stand bending cold round a bar of its own diameter, through an angle of 180°, and should close down upon itself without fracture on the outside of the bent portion. All welding will be prohibited unless where absolutely necessary, and must be done only with the sanction of the engineers.

All bars and Lock Woven Mesh shall be free from scale, flaws, or other imperfections, and from oil, but a slight coating of rust is not objectionable. Wherever cinder concrete is used, the bars before being placed in position should receive a coating of neat cement grouting.

PLACING OF CONCRETE.

All concrete shall be placed in its final position in the work as soon as possible after mixing. In no case must more than half an hour be allowed to elapse before this is done. The concrete must be placed gently into position in layers not exceeding 6 ins. thick, and must not be tipped or dropped from a height. It must be thoroughly rammed into

position, great care being taken to see that the steel reinforcement is thoroughly surrounded by the liquid cement, and that no voids or cavities are left. This can be ensured only by repeated ramming with a suitable tool.

In hot weather the concrete shall be continually moistened for at least a week after placing in position.

CESSATION AND COMMENCEMENT OF WORK.

Stoppage of work in laying concrete in slabs, beams, etc., will be allowed only at the third points of the span of the slab, or a beam, and the joint with the new concrete should be a vertical plane at right angles to the direction of the span of beam or slab. No joint must be made towards the ends of beams or slabs, or close to a concentrated load.

Wherever a stop has been made in concreting, before recommencing the work the surface of the existing concrete must be carefully washed with a stiff brush to remove loose particles and dust, and a 1 in. thick layer of neat cement and sand 1 to 1 must be poured over it before the concrete is rammed against it.

FROSTY WEATHER.

No concreting work should be done when the temperature is near or below freezing point. If a frost comes on shortly after any concreting work has been completed, this should be very carefully covered over with sawdust, straw, or sacking, and the centering must be allowed to remain up for at least as long a time after the complete disappearance of the frost as it would have been left in position if no frost had occurred.

A NEW TYPE OF GIRDERLESS FLOOR.

There is now nearing completion in Boston, U.S.A., a large wool storage warehouse for the Terminal Wharf and Railroad Warehouse Company, in which girderless reinforced concrete floors of a new type, and concrete columns containing steel cores, have been used. The building is 65ft. by 388ft. in plan, and eight storeys and basement high. There are no wall columns, and the brick walls carry the floor slabs directly.

The building is divided into four sections (each either 96 or 98ft. long) by 12in. brick fire walls, each storey of which is carried upon the floor slab directly below. Each section can be operated independently, as it is supplied with its own elevator and stairway enclosed in fireproof wells.

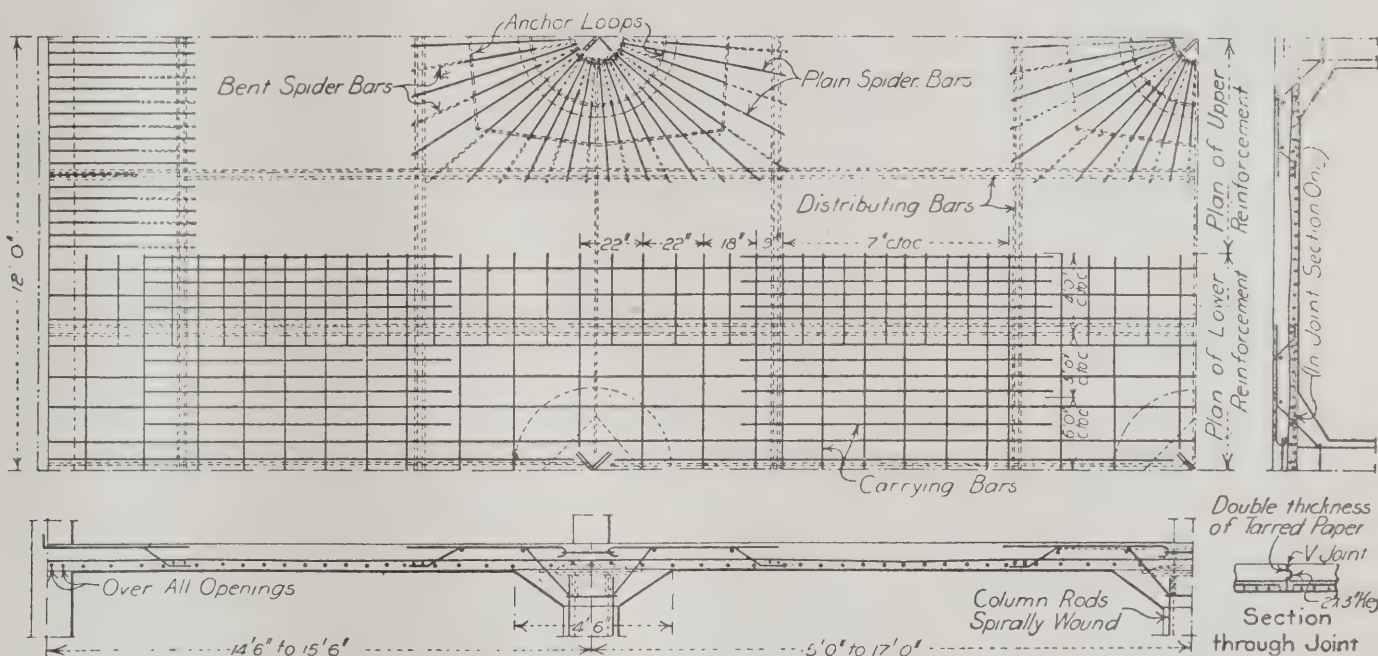

The structure is carried on piles spaced 24 to 36in. on centres, on which is a con-

The storey heights are 8ft. floor to floor in the basement, 13ft. in the first storey, 11ft. in the second to seventh storeys inclusive, and 12 to 14ft. in the eighth storey. The columns are spaced 12ft. on centres longitudinally, and 15ft. 10in. transversely, and are all of circular cross-section. All floors are of the girderless reinforced concrete type, 8in. thick. The roof slab is 5in. thick, and is also of the girderless type.

All floors were designed for a combined dead and live load of 400lb. per sq. ft., using a safe working stress of 650lb. per square inch in the concrete in compression at the centre of the panel, 750lb. per square inch in the concrete in compression at the contour of the column, and 16,000lb. per square inch in tension in the steel. The reinforcement, as will be seen from the illustration, differs materially from the customary reinforcement of girderless floor, and has been developed by the engineers for this structure.

The distributing bars are designed to take up any concentrated load that might be imparted to them by the carrying bars. The spider bars, in addition to transmitting the loading from the distributing and carrying bars to the columns, are designed to provide for the negative bending moment around and above the column top.

Upon the assumption that the total bending moment resulting from the total loading per bay is resisted by the safe moment of resistance of the section around the contour of the column head, the thickness of the head as it approaches the column shaft is increased as the length of the contour decreases, so that the total resulting safe moment of resistance of any circular section or contour at any distance from the centre of the column will be ample to provide for the total bending moment at the particular contour. Theoretically, on account of the rectangular bays or panels, the distribution of stress

REINFORCEMENT OF GIRDERLESS FLOOR SLABS.

crete mat enclosing and covering the pile heads, extending over the entire site and projecting 6ft. beyond the building walls on all sides. The pile spacing, and the number of piles under each footing, are varied in order to secure a practically uniform load per pile of 10 tons, this small figure being selected on account of the variable bottom encountered. The average penetration was 2in. with a 3,000lb. hammer under a drop of 15ft.

On the mat is a separate pyramidal pier for each column measuring 9 by 12ft. at the base, 3ft. square at the top, and 5ft. high. The space between these piers is filled, and on the filling is laid the concrete basement floor, 5in. thick, and reinforced similarly to the floors above, but only about 40 per cent. as strong. The reinforcement is so distributed between the upper and lower portions of the slab as to provide for an upward tide-water pressure due to a head of 3ft., as well as a total live and dead loading downward of 300lb. per square foot, assisted by the direct bearing upon the more or less compressible filling.

Piers of the same type as for the columns are used along the wall line, and carry the walls on arches sprung between them.

In this system the regular slab reinforcement bars, called "carrying bars," run in two directions at right angles to each other, and rest on pairs of distributing bars dividing the main panels into nine smaller rectangular panels. The distributing and carrying bars deliver their loads to the bent "spider bars," the term spider designating the radial bars around the columns. These spider bars are of two varieties; half are bent to conform with the flared column top and engage the lower "anchor loop" around the column. The other half are plain except for a hooked end at the column, and engage the upper anchor loop. The bars near the top of the slab receiving the spider bars, the one circular and the other forming an irregular octagon, called spacing bars, are intended to provide for all tensile stresses in the slab outside of the spiders, and all temperature stresses caused by expansion and contraction through the range of temperature encountered. As no heating is required for the building, the temperature range is a maximum, although not so great as the range of outside temperature. Steel to provide for a range of 70 degrees Fahr. without increasing the stress in the tensile bars over 16,000lb. per square inch is pro-

vided. The distributing bars are designed to take up any concentrated load that might be imparted to them by the carrying bars. The spider bars, in addition to transmitting the loading from the distributing and carrying bars to the columns, are designed to provide for the negative bending moment around and above the column top.

The columns in the basement and the first to fifth storeys have steel cores consisting of four angles riveted back to form a star-shaped section. In the three upper storeys the columns are of concrete reinforced with longitudinal and spiral rods. The columns in the lower six storeys and basement are 18in. in diameter, and in the two upper floors 14in.

The steel cores at the maximum section consist of four 8 by 8 by 1in. angles, and are supplemented by eight 5in. round rods. The smallest steel core consists of four 6 by 6 by 1/2in. angles, and is supplemented by the same size and number of rods. The cores were built up in lengths each one storey in height, and the splices were made by short lengths of angles riveted to each of the angles of the core and bearing on 3/4in. bearing plates.

Where the structural steel cores were used they were designed to provide for the entire loading without being stressed over 12,000lb. per square inch. The concrete surrounding the cores is intended for fire-proofing purposes only, but as a matter of fact the concrete section in all cases is adequate to provide for the load from one floor bay, if all instead of part of the latter should, because of construction defects, be delivered to it. This latter loading cannot accumulate, but is transferred to the steel core of the column immediately below by direct bearing on the column cap. Sufficient steel reinforcement in the form of eight vertical bars enclosed within a spiral of heavy wire is furnished to give the required hooping for the particular stress, as well as to bind the four quarters of the concrete casing to the steel core.

In the three upper storeys where the steel cores are omitted the columns are designed in accordance with the recommendations of the Joint Committee report for hooped columns.

A platform 7ft. wide runs along one side of the building, and in its construction advantage was taken of the possibilities of reinforced concrete to dispense with a costly foundation under the outer edge. The platform is designed for a live load of 300lb. per square foot, and is cantilevered out 7ft. in the clear from the foundation walls with no other means of support. Any support at the outer edge would have required a foundation extending down about 35ft. from the top of the platform, composed probably of piles 20ft. long, and 15ft. of masonry.

The cantilever slab is 8in. thick, reinforced by transverse rods, the percentage of which, in relation to the concrete, is decreased from the wall outward to the edge by stopping certain of the rods at two intermediate points. Distributing bars are placed longitudinally in the middle of the slab.

The interior walls are carried storey by storey upon the floor slab immediately below, and the design is sufficiently heavy to allow partition walls to be erected anywhere in the future without planning foundations for them. Thus the size of rooms may be varied to suit the tenants.

On one of the floors cement was stored when the slab was about six weeks old. Though the bags were piled from 5 to 10 high, it is stated that no cracks resulted. A twin building, of exactly similar design, using the same type of girderless floor, has been occupied for about a year, with all floors carrying full live load, and some considerably more. It is stated that no cracks have resulted.

The building was designed, and the erection supervised by Messrs. Warren and Gerrish, architects and engineers, Boston, who also designed the floor and column forms. It was built by Messrs. James Stewart and Company, general contractors, whose head office is in New York City.

A New Road Between Eastbourne and Hastings.

A project is under consideration for the construction of what will virtually prove a new highway linking up Eastbourne, Bexhill, and Hastings. Should the scheme be successfully carried through, an immensely improved means of communication from Eastbourne to Hastings will be brought into existence; and motor traffic especially will feel the benefit of it, as the whole route will probably command a continuous view of the sea.

ECONOMICAL REINFORCED CONCRETE DESIGN.

It may have occurred to many old students that the design of reinforced concrete work is, to a certain extent, conducted in a haphazard manner; especially is this noticeable when the reinforcement is roughly estimated before the stresses are found, and should the estimate be incorrect, the process has to be repeated. In the case of simple floor slabs, this may be obviated by using the formulæ deduced below, which have proved useful to the writer:

Let m = ratio of the moduli = $\frac{E \text{ steel}}{E \text{ concrete}}$ = say 15.
 d = depth of steel below top surface.
 Kd = depth of natural axis.
 b = breadth of slab.
 C = compression stress (max.).
 T = tensile stress.
 p = ratio of area of steel to area of concrete.

$$\text{Then } \frac{mC}{T} = \frac{Kd}{(1-K)d} = \frac{K}{1-K} \quad (1)$$

But total tension = total compression \therefore

$$pbdT = \frac{C}{2} bKd. \quad \text{i.e., } cK = 2pT. \quad (2)$$

Substituting value of T from equation (1)

$$K = \sqrt{(p^2m^2 + 2pm) - pm}.$$

The above formulæ were taken from the R.I.B.A. Report.

Now the floor slab is only doing its work economically when both steel and concrete are stressed to their allowable stresses at the same time (namely, 600 lbs. for concrete, and 17,000 lbs. for steel). If these values are substituted in equation (1), we get the correct depth of the neutral axis in terms of the depth of the slab.

$$\frac{mc}{T} = \frac{K}{1-K} = \frac{15 \times 600}{17,000} \quad K = .346 \quad (8)$$

The arm of the stresses, i.e., the distance between the centres of compression and tensile stresses may now be found, and is equal to $d(1 - \frac{1}{3}K) = .8846d$.

The ratio of steel to concrete may also be obtained by substituting the values in equation (3).

$$K = \sqrt{(p^2m^2 + 2pm) - pm} \quad -pm. \\ .346 = \sqrt{(15^2p^2 + 2 \times 15p) - 15p} \quad -15p. \\ (.346 + 15p)^2 = 225p^2 \quad 30p \quad (4) \\ p = .0061$$

This ratio of steel to concrete never varies in an economical slab, and is a fixed value. The depth of the N.A. and the arm of the stresses are also fixed.

The results may now be summarised:
ratio of steel to concrete = .0061 } fixed
depth of N.A. = .346d } values.
stress arm = .884d }

The Bending Moment = area \times average stress \times arm of stress.

$$M = b \times .346d \times 300 \times .884d \times \frac{1}{2240}$$

$$M = \frac{300 \times .884 \times .346bd^2}{2240}$$

$$d = \sqrt{\frac{BM}{.041 \times b}}$$

and considering 12 in breadth of slab.

$$d = \sqrt{\frac{BM}{.494}} \quad (5)$$

$$\text{and Steel} = pbd = 12 \times .0061 \times d = .0732d \quad (6)$$

Example:—

Floor 6ft. span. Load 2cwt. per sq. ft. inclusive. Load on 12in. strip = $6 \times 1 \times 2$ cwt. = 6 tons.

$$\text{B.M. say } \frac{WL}{8} = \frac{.6 \times 72}{8} = 5.4 \text{ in. tons.}$$

$$\text{Depth of steel } \sqrt{\frac{5.4}{.494}} = 3.3$$

$$\text{Steel} = .0732 \times 3.3 = .241 \text{ sq. ins.}$$

Say overall depth of slab = $4\frac{1}{4}$ in.
and steel bars = $\frac{3}{8}$ in. every $5\frac{1}{2}$ in.

The extreme simplicity and accuracy of the formulæ above (relatively) will no doubt be recognised by many who have to deal with the design of reinforced concrete.

TERRA-COTTA AND REINFORCED CONCRETE.

SOME OPINIONS BY LEEDS ARCHITECTS.

A recent article in "The Yorkshire Evening Post," calling public attention to the multiplication of terra-cotta buildings in Leeds, appears to have aroused much local interest. The views of four representative Leeds architects are given below:—

Mr. W. H. Thorp, F.R.I.B.A.: "We need, perhaps, to wait a little longer to see whether this new material lasts or not, though I think there is every indication so far that it will do so. It certainly keeps clean, and, seeing that so many reinforced concrete buildings are likely to be put up in future, this terra-cotta will be very serviceable. For a manufacturing city like Leeds, with so much smoke, such building material will answer an excellent purpose, and, though personally I still have a preference for stone, there is a great deal to be said for this particular kind of marble concrete. It will be considerably used in future in the middle of large towns, though I do not think it will be employed to any extent in the suburbs or in the country."

Mr. Percy Robinson, F.R.I.B.A.: "Terra-cotta is being largely used by architects for several reasons. It is generally cheaper than stone, and a client's pocket has frequently to be considered nowadays. It is admirably adapted for reinforced concrete construction, and it is easily washed. From the artistic point of view it is unresponsive, and one cannot expect to get that texture and refinement of line and detail which is obtained in stone. The mistake frequently made is to adapt it to designs for which it is unsuitable, for, like all materials, it has its limitations, and, if these are realised, it is capable of a sound artistic treatment."

Mr. Sydney D. Kitson, M.A., A.R.I.B.A.: "Look at the new white terra-cotta shop in Briggate. It was finished in September, and washed down for Christmas, and it brightened up the street during those dull December days. Of course, all would be well if the smoke nuisance could be done away with, but that will take time. Meanwhile, it is very unfortunate that our local stone, excellent in many respects, seems to suck

in smoke and dirt like a child absorbs mother's milk. Properly fired, this terracotta will stand any amount of bad weather. The architects in Canada use it extensively, and it withstands the keen and prolonged frost of that clime. It goes very well with reinforced concrete buildings, and most artistic structures of the neo-Classical order can be erected in this way."

Mr. G. F. Bowman: "It is most useful material to use in conjunction with reinforced concrete, and its clean appearance gives light and brightness to a dull city. The material need not be either white or whitish. It may be in various colours. In the earlier products the very shiny appearance of the material was rather against securing effective artistic mouldings. But this defect has been partially remedied. I think buildings of this material would be less likely to be scratched or snipped if up to say shoulder height granite or some other such dull material were used. I think terracotta has come to stop, and the finish to the surface will still further improve."

A Leeds contributor favours us with the following observations on the controversy:—

Naturally the strongest opponents of terracotta are the men who cut stone, the masons and carvers who see in it the final extinction of their craft, and those most in its favour are the architects who believe it to be the most logical material wherewith to clothe the modern attenuated structures of concrete and iron.

Basing their criticisms on the "crazed" state of some of the earliest examples of terracotta, the stone cutters maintain that the shell-face will quickly perish, forgetting that the experimental stage of the last ten years has passed, and that from the standpoint both of durability and artistic appearance, terracotta is improving day by day. The hot colours and fierce glazes have toned down, and a certain uneven surface, quite suitable to an earthy substance, has taken its place.

Another of the criticisms the masons raise is the wide uneven jointing, which is very much in evidence in all terracotta work, and they make the comparison, rather unfairly I think, between it and the finely chiselled jointing of ashlar masonry. Owing to the nature of the material and the insuperable difficulty of obtaining equality in the firing, the irregularities and unevenness should be candidly confessed when the design and detail of the work are first evolved, remembering its plastic nature and that perfectly horizontal and vertical lines are impossible, and that fluted columns are most unsuitable. As a material to ameliorate the somewhat Stygian darkness of the smoke begrimed streets of our northern sandstone cities, white terracotta is an invaluable adjunct, as it is easily cleaned.

The public, struck by the whiteness of the material—as something distinct from the colour known as "terracotta"—has fastened on to them the term "pot" buildings.

Now, in Yorkshire, the term "pot," is applied not only to brown earthenware utensils, but also to the finest china articles, so that in calling buildings by this name there is a suggestion of fragility and hollowness, and a slightly contemptuous inference that they are "fancy affairs."

However, they have come to stop, and, let it be confessed at once, their great attraction to building owners is their cheapness. But cheapness alone can never be

an argument against them: a thing may be both cheap and good.

The architect's ideal is to use local materials; that is understood. How then does this work out when applied to the question of Leeds shops and warehouses? There is an excellent local material, ready to hand—stone—suited to stand everything that is required of it, except the blackening effect of the local atmosphere. The geographical position of the business quarter of the city, at the bottom of Airedale, surrounded by factories, means that practically throughout the whole winter the atmosphere is, to put it mildly, charged with smoke, with accompanying fog, and that in summer the sunlight is measurably less in the centre of the city than in the outskirts. It means, then, that the local stone with its coarse texture and porous nature, is best seen to advantage when decorated with lichens, which emphasize its texture—it is found in dry walls and dressings on fells and farmhouses in the Yorkshire dales,—contrasting with its grim blackness, as displayed in Leeds Town Hall. Its only excuse, if excuse it be, is that it is decidedly black, thereby inviting comparisons with the close hard stone which gives to Bradford its dingy appearance, contrasting with the rich (?) deep blackness of Leeds stone buildings.

Another Leeds contributor sends us the following comments:—

Commercially, terracotta in Leeds is a local material. Is not that in itself some justification for its use? It has been claimed that more labour is employed in making the terracotta than in working the stone for a building. Whatever be the truth of that, it is irrelevant from the architectural standpoint. A great reason doubtless, is its adaptability to reinforced concrete construction. The artistic objection to the shiny surface of the old terracotta no longer applies to the newer material with its dull white finish. To point out the faultiness of the joints, the irregularities, the twists, and misfits of the materials is also, in reality, utterly irrelevant, because it is not stone construction, with its exact neatness, but a construction of blocks of fired clay.

The popular objections, if there are any, are simply due to the fact that these buildings are strange, strange in that they are white, and that though they become black in a few months, they can be washed, and are white again.

Of course, a general adoption of its use would raise new architectural problems in treating, let us say, a whole street in this material, for now these buildings stand isolated by contrast with their grimy neighbours and perhaps this gives more value to their simple detail than they would have otherwise,—but this can be left to the future.

The writer's personal sympathies, from a pecuniary standpoint, are with stone construction, but it must be admitted that as long as the present waste of coal—in smoke—continues, the local stone of Leeds is unsuited for buildings in the city. And here lies the value of the discussion in the press, and the more valuable object lessons of the white buildings—that the public is realizing that smoke is to blame, and realizing, too, that to remedy this state of affairs more is necessary than repressive fines and prosecution of owners of factory chimneys who break the law—that there must be an adoption of more scientific and economical methods of heating.

INSTITUTE OF BUILDERS' DINNER.

The annual dinner of the above Institute was held at De Keyser's Royal Hotel, Blackfriars, on Tuesday, January 24th. Among the guests were Sir Aston Webb, C.B., R.A., Mr. W. E. Riley, F.R.I.B.A., Mr. W. H. Romaine Walker, Mr. S. Chatfield Clarke, Mr. F. G. Rice, Councillor S. Smethurst, J.P., etc. At the conclusion of the dinner, the usual loyal toasts having been duly respected,

Mr. Leonard Horner, proposing the toast of "The Professions," said that English architecture was pre-eminently above that of any other country to-day. The people who read the history of these times would, he hoped, see the improvements made in the dwellings erected for habitation by the lower classes. To the architects, who had been so prominent in promoting the Town Planning Bill, might with confidence be left the planning and scheming of the houses of the country. Having alluded to the Victoria and Albert Museum, the speaker turned to the profession of surveying, the aid of which was required in all dealings in land. There was also Form IV. to be adjusted. The quantity surveyor, less known to the public, was, he had been told, a gentleman appointed to tell the builder what he had left out of the quantities and accounts; but the builder stood in no need of this aid.

Sir Aston Webb, C.B., R.A., replying for the architects, said he could not congratulate them on prosperous times. The keen competition, resulting in low and cutting prices, was not good for builder, architect, or client. There was a tendency to think that the lowest price was the only thing desirable; but this was a small thing in comparison with having a thoroughly well-constructed building that would require no subsequent repairs. They had every reason to be proud of the builders' work in England. He congratulated them on being connected with so noble an art, and wished them a prosperous future.

Mr. G. Corderoy, F.S.I., replied for the surveyors.

Mr. W. H. Romaine Walker proposed the toast, "The Institute of Builders and its President," and observed that the more he met builders the higher rose his opinion of the integrity of the British builder. In the whole length of his practice he had never had a dispute with a contractor; and he had certainly not personally encountered the gentleman referred to by his Christian name, Jerry, although quite lately he had come across him in the time of Adam. Referring to sub-contracting, the speaker doubted whether it was possible for one human being to produce a great work alone. If only a greater sense of brotherhood existed between all, there would not be so much patchwork. He did not know whether the Institute of Builders had ever applied for a Royal Charter. In view of Coronation year, it would be most appropriate to approach His Majesty to see whether this dignity was not possible.

The President (Mr. Frederick Higgs), replying, said he had been asked in what way the Institute differed from the London Master Builders' Association. He would give a short historical account. In 1834 the guilds and their property were gradually slipping out of the hands of the craftsmen, and the Society of Builders was formed. This society dealt with the trade matters which were now tackled by the L.M.B.A. Shortly after this, the Central Association of Master Builders of London

(the immediate parent of the L.M.B.A.) was formed, and in 1884 the Society of Builders became the Institute of Builders. Having referred to the Institute's educational activities, and to clauses 20, 27, 28, and 30 of the form of contract, which stood in urgent need of amendment, Mr. Higgs urged non-members of the Institute to join, now that they knew a little of its aims and objects.

Mr. H. T. A. Chidgey, proposing the toast, "The National Federation of Building Trades Employers of Great Britain and Ireland," enumerated the advantages of unity, and alluded to the Quantity Surveyors' Association's activities in the direction of federation.

Mr. Samuel Smethurst, J.P., responded, observing that the Institute of Builders represented the aristocratic side of the building trade, and the National Federation the democratic. Apathy was largely disappearing, and the Federation was doing a great work. The employers had been organised, and it was a great testimony to their efficiency that differences between them and the employees could be met and composed by argument. Mr. Smethurst concluded his speech with an earnest appeal for a more energetic endeavour to raise the standard of the dwellings of the poorer classes.

Mr. J. S. Holliday then proposed the toast, "Our Guests," to which Mr. W. E. Riley replied, observing that the building trade had not reached within his memory so high a standard as at the present time. He had built houses to accommodate 48,000 of the poor; and this he considered the greatest honour and distinction ever conferred upon him. He had had only two arbitration cases in the course of his career, and had never made an enemy of a builder in his life. He had found that the builder, if treated fairly, would generously respond.

MANCHESTER SOCIETY OF ARCHITECTS.

MR. J. L. BALL ON THREE EAST
ANGLIAN CATHEDRALS.

On Wednesday, January 25th, a lecture was given by Mr. J. L. Ball, Professor of Architecture at the Birmingham University. After a brief introduction indicating the necessity for the study of ancient architecture and suggesting some methods of study, Mr. Ball proceeded to give a general account of the three East Anglian Cathedrals of Peterborough, Ely, and Norwich, pointing out the close resemblance which originally existed between them, their characteristics as Romanesque minsters, and the changes which have taken place in them in later times. Then, turning aside from questions of archæology, the architecture of the three cathedrals became the subject of discussion, and the opinion was expressed that here, at any rate, the architecture of the twelfth century is supreme in all purely architectural qualities; attention being specially directed to the expression in it of the sense of power. Nor is this expression of power merely crude and uncouth; it is the work of deliberate and expert artists, marked by maturity of style and refinement of proportion. The nature of proportion in architecture was next discussed at some length, and illustrated from these cathedrals, whose architecture is so sparing of decorative accessories, where we feel as we seldom can how little architecture need rely on ornamental details, how much it depends upon proportion. Some of these

proportions were then noted and compared, particularly the great galleries, and the division of the internal height into three nearly equal parts—a notable characteristic of this group of cathedrals, which connects them with Winchester, Cerisy, and l'Abbaye aux Hommes.

Mr. Ball then entered upon a consideration of the exterior architecture of the three cathedrals, noting a certain inferiority to the interior, the difficulty in all architecture in the grand manner of binding together interior and exterior in organic unity. Nevertheless, certain fine qualities are noted in the exteriors, and it was pointed out that both in the Romanesque and Gothic periods the resources of mediæval art were concentrated on the west fronts. The only west front of Romanesque work in the three cathedrals is that of Ely, and this was described. Passing on to the west front of Peterborough, the opinion was hazarded that we have here a Romanesque design translated into the new Gothic manner of the thirteenth century. The essential difference between Romanesque art and Gothic was discussed, and the new spirit introduced into architecture was described and illustrated by the fine scenic example of this west front of Peterborough. These west fronts suggest the principle of frontal design, what Professor Loewy calls the "Law of Frontality," the law of design by virtue of which an object is always conceived in its broadest and most comprehensive aspect. The lecturer discussed this law in its relation to architecture, and also the corollary to it called the Law of Approach, showing that in these laws we obtain a glimpse into the method of Romanesque and later Gothic design. He then analysed the principles of Romanesque design as exemplified in the East Anglian cathedrals, pointing out that the Romanesque architects were essentially arch-builders, using arcading not only for structural reasons but for the purposes of art. Attention was directed to the æsthetic value of the semicircular arch in the sequence of arcades, to the solution of the problem of stability by massive supports without the aid of buttresses, and to other points in the architectural expression of arched construction suggested by a study of this group of cathedrals. The question was asked whether it is possible to detect the peculiar quality in the work of the twelfth century which marks it off from other arched construction, and the answer was found in the expression of flexibility, of the elasticity of structure; and it was shown in what way this expression of flexibility is obtained, the explanation being based on the circumstances under which Romanesque architecture was done, and the conditions of building wholly unlike those of the present day.

Similar reflections on the circumstances of ancient building were next shown to afford some clue to many of the puzzling irregularities in it, and the question of the time actually spent in building a cathedral was fully discussed.

The name "Norman" often applied to Romanesque art in England brings up the whole subject of the local schools of Romanesque, their diversities, and the essential unity of idea which gives to Romanesque architecture everywhere its distinctive character. The paper went on to describe the main purpose of Romanesque from the time when it first emerges from the Roman basilica, its purpose as essentially ecclesiastical art, and as expressing the Catholic ideal.

In these cathedrals of the twelfth century we see Romanesque architecture in the maturity of its genius, and thus, without any period of decadence, it passed. We have much to learn from these great works, and perhaps the most valuable lesson we can learn from them is not to attempt to reproduce them. J. T. H.

PICTURE EXHIBITIONS.

The Burlington Art Club.

We ought to have drawn attention before to the collection now on view at the Burlington Art Club, which includes some very fine examples of old furniture. There are a beautiful English inlaid chest of drawers, late seventeenth century; two grand Italian cassones of the sixteenth century; two splendid oriental jars with a history behind them; two English hall chairs (eighteenth century), with carved eagles' heads on the backs, which have a curious resemblance to French Empire furniture; and an exceedingly elaborate specimen of a buhl cabinet, French seventeenth century work. Two of Chippendale's "ribbon-back" chairs are most remarkable specimens of finished and conscientious workmanship, which might bear examination with a magnifying glass; showing how honest work will do something to atone for radically bad design. The ostensible motive of the exhibition was a collection of the paintings of Le Nain, most of which might, however, have passed into oblivion without the world losing much; the two best are two groups of three children, numbered 1 and 36. There are some good works also by Richard Wilson and Turner, and a Whistler "Nocturne." The club exhibitions are not, of course, public, but access is readily granted to any one taking an interest in ancient art.

The Fine Art Society.

At this gallery there is a collection of water-colours by Mr. A. Pisa (we presume, from his name, an Italian artist), which ought to interest architects, as they largely consist of drawings of remains of ancient architecture at Selinonte, Pompeii, and elsewhere, very well executed. "The courtyard of the house of Vetti," at Pompeii, is one of the best Pompeii pictures we have seen; we have also "Dead Selinonte," a confused heap of early Doric fragments; "The Greek Temple at Segesta"; "The Cloister at Monreale Palermo"; etc. The drawings combine a fine water-colour style with architectural precision and accuracy.

Messrs. Tooth and Sons' Gallery.

The exhibition of water-colour drawings by Dutch artists, at Messrs. Tooth's, in New Bond Street, includes some excellent work by rather new men. The small cattle pictures, "Ploughing," and "Milking Time," introduce us to the work of A. J. Groenwegen, who is a master in this class of subject; and a landscape by W. Steelink, "Fresh Pastures," is still finer. Steelink is evidently a follower of Mauve, in composition at least, but with a style of his own. There are other good works among the twenty-three drawings exhibited.

Business Prosperity.

Gratifying indications of a return to prosperity are becoming now more plainly visible. At the annual dinner at which Messrs. Rea Metal Casements entertained their employees at Ford's Knotty Ash Hotel, Liverpool, Mr. Rea said that the firm had experienced a very prosperous year, and that everything pointed to a continuance of the success.

Piranesi.

GREAT illustrator of architecture may, in his own way, do almost as much for the art as a great architect. If he does not produce great buildings, he records their effects; and if he be an artist of genius, with the power of exhibiting his subjects in a striking and original manner, he can stimulate

both the imagination of architects and their pride in their art, and can impress the general public with an added sense of the grandeur and the poetic significance of that art. Prout, in spite of a somewhat mannered style, must have quickened the public interest in the monuments both of Classic and Mediæval architecture; the late Mr. Fulleylove's drawings of Oxford buildings probably led many to realise for the first time what an amount of architectural beauty and refinement is collected within the narrow limits of the old University city; and Mr. Sargent's few oil-sketches of architectural subjects show such an extraordinary power that we may well wish that he would devote more of his time and genius to work of this class.

But of all illustrators of architecture Giovanni Battista Piranesi, born at Venice in 1720, stands first both for the amount of his work and for the genius in composition and execution displayed in it; and this though he was an artist in black and white only, on which he relied entirely, after having vainly attempted to master the technique of painting to his satisfaction. He was one of the most remarkable of a type of artists who seem to have been born black and white, so to speak, and who only show their true native power in that restricted medium. Pannini, Guardi, and Canaletto, all treated architecture in oil-paintings on a large scale; but they are out-classed by Piranesi's etchings. Pannini's architectural compositions are conventional and stagey in comparison; Guardi and Canaletto painted one class of building and one class of effect, in a broad and sunny style, but without much variety or power of effect. Claude introduces Classic ruins with fine and poetic effect in his pictures, and Piranesi may have been indebted to him both for hints in composition and for the direction of his taste towards the study of the remains of

"The glory that was Greece,
And the grandeur that was Rome,"

as Edgar Poe expresses it.

But there was nothing of Claude's gentleness either in his nature or in his style. He is the Michelangelo of etching; he handles the etching-needle with the same kind of *furor* with which Michelangelo is said to have handled the chisel. In the use of the black line he had found his real power. In his bold contrasts of light and shade, in his cavernous masses of nearly black shadow—never, however, entirely choked with line: always with sufficient points of light to give them depth and consistency—we see the impress of a powerful and almost defiant genius, despising all mere prettiness of effect, bent on tearing out the heart of the mystery which lurked in the massive but crumbling remains of the Roman

and archaic Greek buildings, which appealed so strongly to his sense of architectural grandeur and historic association.

For Piranesi seems to have been stirred to an almost passionate interest in the remains of ancient Roman architecture. Though a Venetian by birth, it was almost entirely from Rome that he drew his inspiration; the fragments of her once great architecture were to him not only objects for picturesque treatment, but evidences of a great historic past which had captivated his imagination. In his own words, as quoted by his biographer, Mr. Samuel, he expressed his conviction that he was doing a great and lasting work in making records of these remains: "I dare to believe that, like Horace, I have executed a work which will go down to posterity and which will endure for as long as there are men desirous of knowing all that has survived until our day, of the ruins of the most famous city of the universe." And he was right, though not exactly in the way that he imagined. We cannot agree with his biographer in the quite unnecessary remark, "This is pompous." It is not pompous at all; it was a perfectly justifiable recognition of the greatness of the work that he was doing. He could not foresee the time when learned and painstaking archaeologists would vie with each other in trying to wrest their secrets from all the old stones of Rome; when a society would be founded for the especial study of Roman remains; when the Forum would be scraped to the bone to get at its history. Piranesi was no archaeologist in the modern sense of the word. But he was something better; he was a poet, who has preserved for us the impression which the ruins of Rome made when they were still mysterious, half-buried remnants of a great past, overgrown with Nature's vegetation. Modern archaeologists are indefatigable in getting at the facts in connection with these architectural remnants. Piranesi gives us their poetry.

Of his three great collections of Roman etchings, one only, "Architettura de' Romani," attempts something like an architectural analysis of construction and design; giving diagrams, for instance, of his idea of the function of the triglyphs, as representing the ends of a system of beams seen in a rather naïve system of construction in the rear. The introduction of such a diagram, and the inclusion of views of the Temple of Concord at Agrigentum, resulted from the fact that Piranesi believed all the archaic architecture on Italian soil to be Etruscan, and therefore (not unnaturally) claimed that it was to Etruscan and not to Greek influence that Roman architecture was due. Architectural history was in a primitive phase in those days. It was to the same conviction, no doubt, that we owe his grand drawings of the *Pæstum* Temples, in which the massive archaic Doric columns, with their strongly marked entasis, stand up, black with age, in his foregrounds. "L'Antichità Romane" consists mainly of comparatively small views, the object of which seems to be purely illustrative, a pictorial record of the various buildings. It is in the two volumes of "Le Vedute Romane" that we see Piranesi at his highest as an artist. These are etchings on a very large scale, and of the most powerful picturesque effect. They are probably, however, accurate also, at all events as to the condition and appearance of the originals as he saw them in his day. He appears to have made some mistake in regard to the dome of *Minerva Medica*, for his

drawing represents the dome built on the decagon plan of the substructure, whereas Choisy figures it as a circular dome showing the earliest example of small pendentives in the ten angles. Perhaps, however, the explanation is that the rounding of the interior of the dome, and the formation of the pendentives, were carried out only in the cement covering, and that Choisy saw indications of this which Piranesi missed. As an example of the work in the "Vedute Romane" we have reproduced, in our principal plate, the fine and learned drawing of the view from within the Pantheon, looking out through the colonnade of the portico; a very unusual view, and not so well known as some others of Piranesi's. It shows that when Piranesi got away from ruins and into a structure where the architecture was in good preservation, he could be as precise and careful an architectural draughtsman as anyone, without losing his remarkable power in effects of light and shadow. The illustration on this page, also from the "Vedute," showing the half-buried columns of the temple

with Cellini, though he did not commit Cellini's crimes. It is characteristic, too, of his passionate attachment to all associations with ancient Rome that he proposed at first sight to a girl whom he met in Rome, merely because the grandiose style of her beauty convinced him that she was descended from an ancient Roman stock; and the marriage thus improvised seems to have been a happy one, except so far as poverty cast some shadow over it; for Piranesi seems to have been miserably paid for his arduous and unremitting labour. Mr. Samuel seems to imply that some part of Piranesi's work went into Adam's and Chippendale's furniture designs; they were both acquainted with Piranesi, but we have compared Piranesi's volume, "Vasi, Candelabri, etc.," with two of Chippendale's publications, without perceiving the slightest trace of so strong a hand as Piranesi's anywhere. Adam and Chippendale, indeed, compared with Piranesi, were but drawing-room geniuses. But as a whole we like Mr. Samuel's book very much; it is not too long or

THE COLUMNS OF THE TEMPLE OF JUPITER TONANS, AS SEEN IN THE EIGHTEENTH CENTURY.

(From Piranesi's "Le Vedute Romane.")

of Jupiter Tonans (which have been also the subject of one of Prout's finest sepia drawings), is a good example of the value of Piranesi's etchings in recording the aspect of old Rome in what may be called its pre-archæological period.

Few of those who know and admire the work of Piranesi the artist know very much of Piranesi the man, and the short and well-written biography of him by Mr. Arthur Samuel* fills a gap in our architectural literature. Here many of us may learn for the first time something of the character of the artist whose works have been long familiar to us, and will not be surprised to find that the defiant force and vigour of his etchings were only a reflection of the character and temperament of their author, who seems to have been throughout his life always ready for a fight with any opponent, and presents in this way somewhat of a parallel

voluminous, and it is well written, well illustrated, and well printed. We have not, however, reproduced any of the illustrations in the book, preferring to make our own illustrations from two of Piranesi's original prints.

One remarkable work, differing from all the others, is the series of plates, entitled "Carceri d' Invenzione," which, we learn from Mr. Samuel's book, were the result of a kind of feverish nightmare which he tried to realise in etching. These are most wild and tragic dream-pictures of scenes of desolation, of weird dungeons festooned with chains and ropes, and are among the most extraordinary inventions ever made by an artist. In execution they are far inferior to the "Vedute," being scratchy and hurried in line and shading, as if the author were bent on realising his idea in the shortest possible time. Professor Blomfield has shown reason to think that Dance was more or less indebted to the "Carceri" for his grim architecture of old Newgate.

The Institute Gold Medal.

THE decision of the Institute Council to offer the Royal Gold Medal this year to Dr. Dörpfeld is not one in which we can entirely sympathise. The learned German archæologist is a most fitting recipient of the honour at some time or other, although he has started at times some very preposterous theories, which all seem to be obediently accepted by his ring of admirers; but his reputation is that of an archæologist, not an architect; and the medal was awarded to an archæologist, Dr. Evans, only two years ago. We should like to see it more decidedly treated as an acknowledgment of works carried out by architects. We might add that there seems to be a great neglect of the claims of French architects. France contains a larger number of architects who, for their executed works, are worth the medal, than any other country at present can show; and the medal has never been offered to the architects of the three most beautiful or remarkable modern buildings in Paris, who certainly earned the distinction: M. Nénot, for the New Sorbonne; M. Ginain, for the Musée Galliera; and M. Girault, for the Petit Palais. M. Ginain, unhappily, is beyond the reach of the honour; but either M. Nénot or M. Girault should have been preferred to an archæologist.

The Mall Improvement.

WHAT appears to be the conclusion for the present of this matter is certainly not creditable to the Office of Works, nor to its present management. The County Council, from a desire that the Coronation ceremony should not be hampered or injured in effect by inability to use the triumphal arch as the outlet from the processional road, has, in a spirit of perhaps too great liberality (from the point of view of the ratepayers), offered to expend £75,000 in the necessary purchase and preparation for widening the entry into Charing Cross, on the condition that they have no further responsibility in the matter and that the architectural completion of the entrance must be undertaken by the Government. The proposal has been received at the Office of Works with expressions of astonishment, and even anger, from which one can only gather that the First Commissioner or his advisers have totally forgotten the whole history of the Processional Road. From Buckingham Palace into Charing Cross it was a national matter from the first, and not a municipal one. The road took a turn at a decorative fountain, from which point eastwards it was to be on the axis line of the Strand, but was still part of the whole National memorial. Now the Office of Works, in effect, say: "Because we have built an arch at the turning-point of the road, in place of the fountain, therefore our responsibility for the eastern portion of the road ceases." The plea is absurd. The whole scheme of the roadway opened into Charing Cross was part of the National Memorial, and the County Council were never concerned in it at all. We apprehend that the Government will, sooner or later, be compelled by public opinion to accept this view.

A Discovery about Nonsuch Palace.

IN the February issue of *The Architectural Review*, Mr. Alfred W. Clapham announces a discovery he has made in connection with the Palace of Nonsuch. Of this wonderful building, the most important of the five which Henry the Eighth erected in the course of his thirty-eight years' reign, nothing now remains, and for some image of it we are left to old prints and records. What is known of the building is derived chiefly from the Parliamentary Survey taken in 1650 (which gives a detailed account of the palace and grounds) and from two views—one by Hofnagle, and the other an inset in Speed's Map of Surrey. Both of these represent the garden or south front of the house, and the appearance of the north front and sides has up to the present

time been quite conjectural. Mr. Clapham, however, is able to reproduce a third view, taken from the north-west, showing this front and the flank of the building. The original engraving was published by the Society of Antiquaries in 1765, with the title "Richmond Palace from the Green." It is clear, however, that this picture is not Richmond, but Nonsuch, and one can only be surprised that such an interesting fact has never before been discovered. The Palace of Nonsuch achieved a reputation for magnificence throughout Europe, and it must always be a heavy indictment against the first Duchess of Cleveland that she should have utterly destroyed the building, and cut up the park into farms. Fragments of the palace found their way to Gaynsford Hall, Carshalton, to Durdans by Epsom, and to the vicarage at Ewell, but these houses have since been rebuilt, and all the authentic remains of the most remarkable of Tudor buildings lie buried beneath the turf of Nonsuch Park. The archæologist is apt to think that monastic houses and feudal castles are alone worthy of his attention; but, as Mr. Clapham points out, the recovery of the ground plan of Nonsuch would be an achievement of even greater architectural value, while its wealth of historic associations places it far above them all in sentimental interest.

There are many other good things in the February *Review*, among them being the first of two articles by Mr. Arthur Keen on "The Ceilings of the City Churches," the concluding portion of the article on Greenwich Hospital (finely illustrated), some beautiful photographs of notable examples of furniture in the collection of Mr. W. H. Lever, and, in the Town Planning Supplement, an article on a curious proposal to construct a new bridge across the Seine at Paris in the form of the letter X.

Housing and Town Planning: "The Dream and the Business."

MR. ALDRIDGE, of the National Housing and Town Planning Council, delivered, at the Council meeting of the National Federation of Building Trades Employers, at the Trocadero Restaurant, Piccadilly Circus, on January 24th, an interesting address on the administrative aspects of the Housing and Town Planning Act. His main object was to urge master builders to engage actively in the administration of the Act, and especially to assist in the sweeping away of wretched hovels, and in the substitution of a type of building that should be incomparably better both hygienically and æsthetically. He threw out a not unnecessary word of warning on an aspect of the question that hardly tends to edification. The Act, he said, while it is undoubtedly, in principle, deserving of all sympathy and praise, was by no means free from what he called "heartbreaking intricacies"; and, as he further remarked, it would be strange indeed if, in so new and so large an enterprise, there were not, at the beginning, all kinds of crudities in the details; and it would be equally strange if the administration of the Act were not beset by the advocates of all kinds of fads and follies. The crudities will disappear with experience, and the machinery of the Act will be improved and perfected step by step, as in the case of mechanical inventions—such, for instance, as the motor car, which was cited as an instance of vast improvement upon the original conception; while for the fads and follies of well-meaning but uninformed amateurs, the professional and practical knowledge of architects and builders will afford a wholesome corrective. There is no difficulty, therefore, in subscribing to Mr. Aldridge's earnest exhortation to professional and business men "to come right forward in the front rank and help to shape and mould the movement on right lines and guide it to right issues." Mr. A. W. Sinclair, in proposing a vote of thanks for the address, referred to Continental instances of town planning, in which the builder and the private owner had been made to suffer great hardships; and Mr. Aldridge's cheery rejoinder that

"we indeed ought to improve on the example of the Continental nations, and profit by their mistakes" is a courageous way of looking at the matter; but, like Mr. Sinclair's statement, it emphasises the necessity for keeping a watchful eye on the movement.

The St. George's Hall Controversy.

ST. GEORGE'S HALL, at Liverpool, is the finest example in Europe of architecture of the Greek revival, the work of an architect who was superior in genius and originality to either of the two most celebrated German architects of the same school, Schinkel and Klenze; and the controversy which has raged in Liverpool over the proposal to blend with it a monument of the late King—a controversy the bitterness of which can only be realised by those who have seen the Liverpool papers of the last two or three weeks—is at all events a satisfactory indication that there are a number of people in that city who really care about their great building, and who can be moved to indignant protest over any proposal to interfere with its architectural lines.

Apart from the purely architectural question, we should say in the first place that the proposal to connect a Liverpool memorial to King Edward the Seventh with a special building, so as to appear almost a part of its architecture, is misconceived. A Liverpool memorial to the King is connected with the City of Liverpool as a whole, not with St. George's Hall, or with any other special building. Such a monument might fitly be placed in an open space in front of a great building, or surrounded by great buildings; but to connect it architecturally with one particular structure is to limit its significance, and to convey a wrong idea.

The architectural question is, however, that in which we are most interested, and from that point of view we are absolutely opposed to the proposal which has been the occasion of the controversy. It is a proposal to cut two flights of steps through the high podium wall before the south end of the building, and on the centre line between them to place an equestrian statue on a very high pedestal, which will thus become, practically, a part of the architectural composition of the building.

It should be apparent at once that to do this is to break up the monumental grandeur of the building, and to thrust into the composition a feature which is intrusive and out of scale with it. But there is more to be said than that.

In the first place it is a disadvantage in the position of St. George's Hall that its principal facade, to the south, with the portico and pediment, fronts towards a slope of the ground at right angles to the longer axis of the building; a very bad position for a building on Classic lines. Now, the advantage of the high mass of wall at this point, which some people say is so uninteresting, is just this: that it completely separates the building from the sloping road, and gives it a level base so strongly marked that the eye is fixed by that, and can ignore the slope of the road at the foot of the wall, as something unconnected with the building. Even some of those who support the proposed scheme seem to perceive that there will be difficulties with the two flights of steps, which ought to be symmetrical, but cannot be so on account of the slope of the ground; but no one seems to have perceived that it is precisely the existing high podium wall which gets rid of this disadvantage of site.

The other objection in our mind, which no one seems to have fully realised, is that to erect a lofty monument in close connection with a pedimented facade, and in line with the apex of the pediment, is *bad architectural composition*. Take as an instance the Ruhmeshalle, near Munich; there the colossal statue stands in front of the centre line of a columned building, but that centre is a block with a horizontal cornice; the two pedimented facades come on either

side of the axis of the monument, not behind it. One can have a pediment in the centre and a monument on each flank of the facade (as was the case in some of the Roman temples), or one can have a pedimented wing on either side and a monument on the centre axis; but there cannot suitably be a central monument directly under the apex of the pediment; not, that is to say, where the monument forms practically part of the architecture, as is proposed in this case. We observe that in one of the papers the fact that Rodin's statue, "Le Penseur," is placed in front of the Panthéon, is quoted; but that is not a parallel case. The statue there is in no way connected with the building, it is only situated in the centre of an open space in front of it; which can be done there, because the slope of the ground is parallel with the axis of the building, which is not the case with St. George's Hall. And even there the group is not a lofty one. If it had been, it would not have been placed centrally in front of a pedimented building; the French understand these matters far too well for that.

It is a matter of regret to us to appear in opposition to Mr. Norman Shaw, to whom English architecture owes so much, and who, for reasons that we cannot understand, has given his support to this unfortunate scheme; but in this case we think he is wrong; and the question is one not to be settled either by personal considerations or by appeals on either side to those who are supposed to be authorities. There are no "authorities" on questions of art; they are to be settled by reason. Our opinion is that if the Liverpool Corporation carry out this proposed scheme they will put their Edward the Seventh Memorial in a situation quite unsuitable in regard to its meaning and significance, and will do a serious injury to the monumental aspect of their greatest building.

(1) Elmes's original proposal: access from street to south entrance obtained through corridor (under platform) leading to concealed steps which ascended to the rear of the portico. (2) Subsequent project of external flights of steps. (3) Final and existing arrangement: unbroken basis serving simply as pedestal to the great portico.

ROUGH SKETCH PLANS OF THE SOUTH PORTICO OF ST. GEORGE'S HALL, LIVERPOOL.

ARCHITECTS' RESPONSIBILITY FOR DRY ROT.

As briefly announced in last week's Journal, Mr. Justice Channell, on January 25th, gave judgment in favour of the plaintiffs in the action brought by the Leicester Board of Guardians against Mr. John E. Trollope, architect. It appeared that in February, 1908, it was found that dry rot had developed to a very serious extent under the floor of the North Evington Infirmary, which building had been completed about two years before under the architectural supervision of the defendant.

Mr. Hugo Young, K.C., representing the plaintiffs, stated, in the course of his opening address, that the renewal of the affected flooring had cost about £2,000, and that "the plaintiffs claimed first of all for negligence in supervision; secondly for negligence in giving a final certificate which exempted the contractors. They also claimed for breach of agreement to do the work of repair. There was a counter-claim by defendant against the plaintiffs for not appointing a fit clerk of the works; to which the reply was that the clerk of works appointed had the approval of the architect, and the defendant had himself in a letter acknowledged that the clerk of works had been most zealous in bringing defects to his notice.

The chief witness for the plaintiffs was Alderman Sawday, F.R.I.B.A., who stated that he had been in practice in Leicester for thirty years, and had been called in to report upon the North Evington Infirmary. He had found that dry rot was spreading practically throughout the building. The extent of the flooring was a little less than an acre. He had found from 8,000 to 9,000 pegs. In his view, the presence of the pegs was the cause of the dry rot. There were indications that the joists were fixed on the pegs, and that the concrete was thrown in afterwards.

Mr. Pollock, K.C., addressing the Court for the defence, submitted that the defendant was not liable. It was not to be disputed that certain details were not carried out in accordance with the specification; but if the architect were to spend his time constantly upon the work to see that every feature was dealt with according to the original plans, he would have no time to perform other extremely important duties. He contended that the offer made by Mr. Trollope to complete the work was never intended to form the basis of a legal liability which could be sued upon. If the guardians had intended to make a contract, they would have used their seal.

His lordship here interjected that he was not convinced that this was not an agreement, although there was some doubt on the point about the seal.

Mr. John E. Trollope stated in evidence that during the time the floors were being laid at the North Evington Infirmary, either he or Mr. Gough visited the work alternately once a month. He never saw any sticks or pegs, and if any quantity had been put in, he would have had to ask what they were for. The clerk of the works saw him at the works and in London from time to time, and submitted a number of matters to him which arose in the course of the building. The question of deviation in the construction of the floors was never mentioned in any document or minute. Under cross-examination, defendant said that while the work

on the North Evington Infirmary was being carried out he was also engaged on other works, near Manchester. The laying of the floors in the way provided—the 6 ins. of concrete in two layers—was, he assented, an important clause for protecting the building. A quantity surveyor visited the works once a month, but witness did not admit that it was a part of the duty of the quantity surveyor to test whether the concrete was 6 ins. thick. In the course of this cross-examination, the following interesting passages occurred:

—Q.—Do I understand that the clerk of the works is king of the job, and that everything he says has to be taken as conclusive? A.—Not at all. He is there to see that our specifications are carried out. Q.—Is it not part of your duty to supervise the clerk of the works? A.—General supervision. Q.—Is it not part of your duty, for instance, to see that proper timber is used? A.—Certainly. Q.—If he told you the timber was perfectly sound, was it not part of your duty to look round to see whether it was or not? A.—Yes, certainly. Q.—If he tells you that the concrete has been properly laid is it any part of your duty to see if he is truthful about that? A.—No. Q.—What is the difference? A.—The difference is that the concrete is put in the proper depth. Q.—Is he not there to see that timber is put in properly? A.—Yes. Q.—What is the difference? A.—One is a compound material, and the other is timber and natural. Q.—Did you at any time, when you went down, examine the least bit of this acre of flooring to see whether it had been laid on your principles? A.—No, not especially. Q.—Or at all? A.—I don't think so. Q.—Did you make any surprise visits or give notice of your arrival? A.—I think I made two or three surprise visits. Q.—Do you really suggest that in laying concrete floors where dryness is essential it is not a duty of the architect to take means personally to see if his designs are being properly adopted? A.—With a proper clerk of the works, certainly not. Q.—Wasn't it your duty to see your principle was carried out? A.—No, I don't think so. Q.—Did it ever occur to you that the clerk of works might misunderstand what you wanted? A.—No, he couldn't misunderstand from the drawings and description. —The £5,000 paid defendant's firm in fees was not large for so large a work. He thought that about 700 drawings had been made. Re-examined, he asserted that, supposing there had been a desire to conceal from him the way in which the work was being carried out, there would have been no difficulty in deceiving him.

Mr. E. T. Hall, F.R.I.B.A., gave evidence to the effect that it was the duty of a clerk of works to see that details were properly carried out.

Mr. C. Fitz-Roy Doll, F.R.I.B.A., F.S.I., architect and surveyor, who said that he had had forty years' experience in his profession, stated that he went to the North Evington Infirmary on November 14th, 1910, and examined the work. The fact that pegs were used did not indicate that the work was being done wrongly. Pegs had to be put in so as to get the level. In answer to Mr. Hugo Young's suggestion, "The architect in this case, apart from other questions, has certified for the buildings for £400 more than he ought to have certified for," witness replied, "The builder has obtained £400 more." Q.—By the certificate of the architect? A.—It has been put in the certificate of the architect, no doubt.

Mr. James Arthur Butler, who was a member of the Leicester Board of Guardians while the North Evington Infirmary was in course of erection, stated that the clerk of the works appeared, he believed, before several committees, simply in order to give any information that a committee might from time to time require, and it was not within witness's knowledge that the clerk of works had on any occasion been reprimanded.

Mr. Pollock, K.C., addressing the Court for the defence, contended that, since in one clause of the contract the clerk of the works was described as an inspector and assistant to the architect, and there was also provision made for what should be done in the absence of the architect, then it was quite clear that under the contract there was no intention that the architect should be constantly on the spot, but that very considerable duties were entrusted to the clerk of the works. In concluding his address, Mr. Pollock submitted that the architect could not be held liable for matters concealed from him by persons who were not appointed by him, and whom he had no power to discharge.

In delivering judgment, Mr. Justice Channell said that the plaintiffs had made no imputations upon the good faith of the defendant, and he was very much impressed with the candid way in which he had given his evidence. Defendant could have given evidence in his own favour much more strongly than he did, but he was an exceedingly candid witness. One was sorry to give judgment against him, but the facts were extremely clear. When the building was completed, it was discovered that all the timber in the lower part was badly affected by dry rot. Investigations were made, and it was discovered that the design—he dare say an ordinary design—intended to prevent the occurrence of dry rot had not been complied with. Somebody was undoubtedly to blame. The builder had to perform his contract, but had no authority from the architect to deviate from it. But there was a difficulty in the way of suing after the builder had got the architect's certificate of completion. Then the Board of Guardians, perhaps not unnaturally, said to the architects, "You ought to have seen to this, and we make a claim against you personally." A proposal was made that defendant, although he repudiated all liability, and wished for his own credit that nobody should have any complaint against him in a work of that kind, should make the matter good. Upon that the Board of Guardians omitted to take any proceedings they were threatening. He could not entertain the slightest doubt, subject only to the question of the seal, that that was an abiding agreement. The point put forward about the seal created some difficulty, and therefore with the possibility of the case going to the Court of Appeal, he thought he ought to decide that question. Plaintiffs' counsel had quoted cases which appeared to him to remove the difficulty. Proceeding to deal with the contention of the defence, that the fault lay with the clerk of the works, his Lordship said in one sense no doubt it was the fault of the clerk of the works. Whatever the duty of the defendant and his partner was, it was clearly the duty of the clerk of the works to call attention to what was going on, but did that relieve the defendant? He did not think there was any difficulty in saying what the respective functions and duties of architects and clerks of works were. He had a fairly

"THE CROFT," RUDDINGTON, NOTTS: GARDEN FRONT. H. TATHAM SUDBURY, ARCHITECT.

clear idea himself, and the witnesses who had been called practically agreed that in all matters of detail the clerk of the works had to see to it. Everybody knew the architect could not be on works all the time; and everybody knew that the clerk of works was appointed to protect the interests of the employer against the builder. It was said that the clerk of works was a servant of the plaintiffs, and therefore the defendant was excluded. If a party to a contract prevented the other party from performing his contract, of course that was an answer. An employer was not responsible for the fraud of a servant if the servant did it in his own interest, and not in the interest of his employer. On the main question he must hold the defendant responsible. He was sorry it was so, because it was a serious liability, and defendant had behaved extremely well. He had no doubt that defendant honestly agreed to do the whole work, but, having found it more than he expected, he tried to back out of the agreement. That was merely succumbing to a temptation which was quite a natural one. He thought defendant was liable in this case, and must give judgment against him.

Mr. Young mentioned the question of the amount of damages, and it was decided that this should be agreed upon later.

The judgment was for the plaintiffs on the claim and counter-claim with costs.

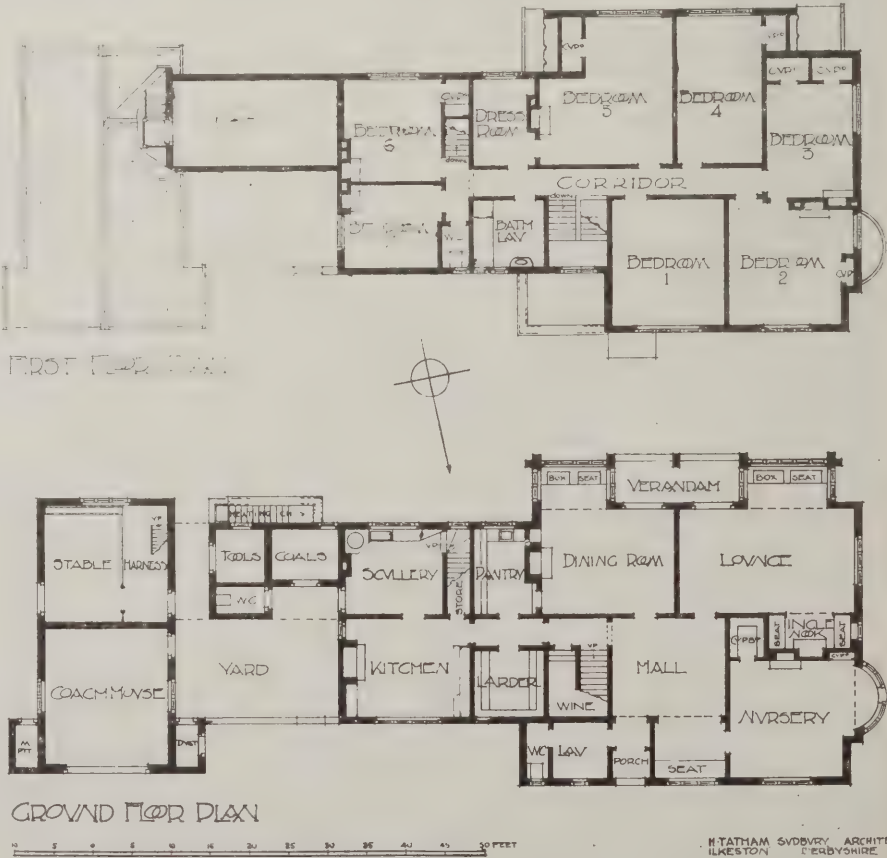

THE ANGLO-AMERICAN OIL BUILDING, WESTMINSTER.

We regret that, owing to a misapprehension when publishing the small view of the Anglo-American Oil Company's new building, Queen Anne's Gate, Westminster, in our Edition 'De Luxe' (December 31st, 1910), we ascribed the authorship of the design incorrectly. It should have been stated that the architect was Mr. Ernest Runtz, F.R.I.B.A., F.S.I.

"THE CROFT," RUDDINGTON.

This house occupies a fine site of several acres, with a small spinney in one corner of the site, through which the carriage drive has been formed. The house is built of common brick, covered outside with rough-cast stucco, whitewashed, and having a black brick plinth. The roof is covered with dark red hand-made tiles. The lounge has a polished oak floor, and the walls of the room are panelled in dark

oak. The dining-room, nursery, and hall are finished with canary wood; stained and wax-polished. The house is heated throughout with low pressure hot water. The general contractors were Messrs. Donnelly and Sons, of Kimberley, Notts. The garden has been laid out to the instructions and under the superintendence of the architect (Mr. H. Tatham Sudbury, of Ilkeston) by Messrs. W. Barron and Son, Ltd., Landscape Gardeners, Borrowash, Derby.

"THE CROFT" RUDDINGTON.

H. TATHAM SUDBURY, ARCHITECT
ILKESTON DERBYSHIRE

ARCHITECT'S CLAIM AGAINST A CORPORATION.

SEWARD V. CARDIFF CORPORATION.

On December 12th, in the High Court of Justice, before the Official Referee, Mr. Muir Mackenzie, Mr. Edwin Seward, F.R.I.B.A., architect and surveyor, practising at Cardiff, sought to recover from Cardiff Corporation the sum of about £9,000 for the preparation of plans for a free library and Welsh National Museum at Cardiff, and as damages for alleged breach of contract. The corporation contended that they had power to discontinue the undertaking, and that they were only liable to pay plaintiff remuneration valued by the work he had done. They estimated that value at £1,500, which sum they paid into Court. Counsel for the plaintiff were Mr. E. M. Pollock, K.C., Mr. Rowland Vaughan Williams, and Mr. Herbert. For the defendants the counsel were Mr. B. Francis Williams, K.C., Mr. John Sankey, K.C., and Mr. St. John Francis Williams.

Mr. E. M. Pollock, in opening the case, stated that in June, 1890, Mr. Seward was consulted as to the preparation of plans for a library for Cardiff Corporation. Afterwards the project was extended, and it was proposed to add a museum. The site first suggested was in Working Street, but in 1894 or 1895 a site in Park Place was under consideration, and, of course, the different sites required different plans. Towards 1900 a larger site was secured in Cathays Park, and a much larger scheme was contemplated. The Working Street scheme was to cost £20,000 to £25,000, and by 1902 the ultimate expenditure suggested was £150,000 or £160,000. Under an agreement with the defendants plaintiff was induced to enter into the preparation of plans for this scheme, and in 1904 the scheme was still further expanded, to include the erection in Cathays Park of a National Museum for Wales. In the brochure and advertisements for the promotion of this scheme, Mr. Seward's elevation and plans were reproduced. In 1907 defendants were empowered by Act of Parliament to hand over the museum scheme to a body incorporated under Royal Charter, who were entitled to receive the documents relating to the proposed museum. A great deal of work had been done by Mr. Seward in connection with the various schemes, and he had been deprived of his "clear and profitable employment" by the handing over of the powers to another body. When the Bill was introduced into Parliament, Mr. Seward felt bound to oppose it; and in the Act which was passed in 1909 a clause was inserted to the effect that the corporation should discharge their obligations and indemnify the other body against liability. There were thus three periods claimed for—(1) Till 1895; (2) to 1901; and (3) the period since 1901. As regards the first period, the Corporation pleaded the Statute of Limitations, and also that there was no contract under seal. Counsel was afraid that the statute plea must succeed; but he relied upon the agreement of 1901. He contended that the plaintiff was entitled to recover for the work he had done and for the work which he had a perfect right to anticipate doing.

Mr. Edwin Seward, F.R.I.B.A., the plaintiff in the case, was then examined. He stated that he had practised in Cardiff for thirty-four years, and had undertaken many important buildings in that city and

elsewhere. He detailed the circumstances in which he had made plans and done other work in connection with the schemes, explaining that the third set, for the Cathays Park building, were submitted after frequent discussions, and after many alterations had been suggested and made.

Asked, in cross-examination, "Do you know that the Council tried all they could to get the new body to take you on as the architect?" Mr. Seward replied, "They could have done so before it was too late. They could have devised methods by which their undertaking could have been carried out in the future work." The hearing was then adjourned.

On the resumption, the cross-examination of Mr. Seward was continued. In reply to a question from the Official Referee, he said that, with regard to alternative schemes, the committee had their value from them in feeling their way. Asked to say what constituted his appointment as architect to a building scheme of £150,000 to £160,000, he referred counsel to the agreement of December 21, 1901, and said that the paragraph he relied on was what might be called the preamble to that agreement, and he considered that under that he was to be the architect for the building. He relied upon the general attitude of the members towards him, as well as on the agreement.

Mr. Edwin T. Hall, F.R.I.B.A., gave evidence to the effect that he had inspected Mr. Seward's plans for Cathays Park Museum, which he considered to be adequate and comprehensive, each bearing relationship to the others, and he considered the charges were fair and reasonable and according to custom. Mr. Henry Vaughan Lanchester, F.R.I.B.A., and Mr. Max Clarke, F.R.I.B.A., also expressed the opinion that plaintiff's charges were fair and reasonable.

Mr. T. M. Deacon, quantity surveyor, said that the total cubical contents of the whole of the buildings in the final scheme came out at 3,064,594 ft., and the probable cost worked out at £153,983. This closed the plaintiff's case.

For the defendants, Mr. John Ward, F.S.A., curator of the Welsh National Museum, denied that plaintiff was ever instructed to prepare the £24,000 scheme for Park Place. He said that Mr. Seward was formally appointed architect on May 14th, 1895, subject to his withdrawing his claims for work done in regard to the Working Street site. With regard to the Park Place Museum, there was only one scheme, which was from time to time modified and developed. Mr. Ward contended that the index-hall, which was something quite new in this country, was his own suggestion, not Mr. Seward's. Witness was asked by the committee to render all the assistance in his power, and he must say that Mr. Seward had acted most loyally, and was always ready to discuss matters with him. The plans approved by the building committee on May 13th, 1902, were precisely the same as those approved in January and April of the same year. With regard to the new elevations which were drawn up near the end of 1903, there was no instruction from the committee to prepare them. Though the general design had been definitely approved, there was a feeling among the hon. curators that they were not quite satisfied, and, as the plaintiff was aware of this, he was anxious to meet them: therefore he voluntarily drew fresh elevations. In his opinion, there was never more than one scheme for the Cathays Park Museum—first, tentative plans, then working plans, and lastly

working plans developed. He admitted that Mr. Seward must have given a good deal of time and study to the plans, which, as cross-examining counsel suggested to him, represented years of labour. He thought very highly of plaintiff's elevation, which had been framed.

Alderman Illtyd Thomas contended, under cross-examination, that the museum committee did the brain work and the thinking out, and the other part was to a great extent draughtsmanship.

Mr. William Woodward, F.R.I.B.A., thought that the scheme was that of Mr. Ward, that the drawings were more properly to be regarded as one set than as three sets, and that Mr. Seward was entitled to £750, or 2½ per cent. on the £30,000 scheme, with a further £100 for the preparation of half-inch details.

Mr. Arthur Harrison, F.R.I.B.A., having given evidence, the further hearing was adjourned until after the recess.

At the resumption, counsel on both sides were heard, and the Official Referee said he would take time to consider his decision.

Judgment was delivered by Mr. Muir Mackenzie, Official Referee, on Wednesday last, February 1st. The chief points in the judgment are as follows:—It is plain, having regard to the law which regulates contracts by a municipal corporation with an architect or surveyor, that the corporation were under no liability to pay the plaintiff for the work that he did in connection with the plans which he prepared for the Park Place site, inasmuch as there was no contract under seal, notwithstanding that they had the benefit of the work. The next question to determine is whether there is a breach of the contract. The corporation purported to determine the employment of the plaintiff by virtue of the power conferred by Clause 10 of the contract, and the corporation maintained that there was no breach of the contract. I decide the contrary. It is, I think, to be inferred from the judgment of Lord Bramwell in *Hunt v. Wimbledon Local Board* that if a municipal corporation, having made a valid contract under seal to employ a person as architect for certain buildings, say to him, "We will not go on with the buildings or employ you any more," the corporation commits a breach of contract, for which an action for damages can be maintained. That is what the Cardiff Corporation did in the present case. The Building Committee having approved plans which had been made, and appointed a sub-committee to confer as to specifications and contracts, the corporation first postponed the matter, and finally abandoned it, and transferred the assets of the undertaking to another body. Clause 10 of the contract does not apply to what the corporation did. It clearly applies, in my view, to an event which never took place—viz., the commencement of works under building contracts pursuant to plans completed and approved, and a power in the corporation to stop those works. It follows from this decision that, in the first place, the defendant corporation was not entitled to discharge the plaintiff from his employment in the way in which he was discharged, and consequently that the way of assessing the plaintiff's remuneration for the work already done, for which Clause 10 provided, does not apply. There having been a contract made and a breach of it, the next question is what compensation the plaintiff is entitled to. I have had a certain amount of evidence on both sides as to what in the events which have happened

would have been the remuneration payable to the plaintiff under the scale of remuneration adopted by the Institute of British Architects, so far as that scale applies. Judges in directing juries have repeatedly declined to be bound to award remuneration or compensation on the basis of this scale unless that rate of remuneration has been expressly assented to, or it has been established that the owner has known that in employing the architect he would be charged in accordance with the scale. The plaintiff alleges that the museum building which he was employed to design and carry out was to be a building to cost about £150,000, on which sum he would have received 5 per cent., and also his fee for preparing bills of quantities. I find it clear that the corporation never employed the plaintiff to prepare plans for museum buildings to cost £150,000, or anything exceeding £25,000. The corporation's available resources limited them to that expenditure. I am bound further, in considering the compensation to which the plaintiff is entitled, to have regard to the circumstance that if the corporation had proceeded either with the plans approved by the building committee or more extended plans, and had had contracts prepared and works commenced, they could have stopped the whole or any part of the work under Clause 10, in which event the plaintiff's right to remuneration at 5 per cent. would have gone, and he would have received remuneration at the reduced scale mentioned in that clause. Evidence has been given before me that in assessing remuneration for what the plaintiff has actually done for the corporation I ought to treat the plaintiff as having been employed practically to design three different schemes and award remuneration in respect of each of them on the ground that the alterations from time to time directed involved practically the making of three schemes. This evidence has been met by evidence on behalf of the corporation that there was but one scheme, that of Mr. Ward, and what the plaintiff did was to prepare the architectural developments of that part of Mr. Ward's scheme on which the corporation decided to embark, with the consequence that the plaintiff ought to be paid a percentage on the cost of that part of the scheme. Of course, an architect must have a proper compensation for his time, and if there were involved a large degree of architectural knowledge properly so called it must be paid for according to the merits of the individual. But the genus architect was not necessarily entitled to 5 per cent., nor to 2½ per cent., and this Court has already had reason to know that architects were sometimes very formidable persons. As far as remuneration by percentages goes, the view I adopt is that it does not in the circumstances apply either in favour of the plaintiff or the defendants. Dealing next with the prospective remuneration to which the plaintiff might have been entitled, I cannot award him compensation on anything like the scale which he claimed in this action. On the other hand, it is my duty to have regard to the fact that the plaintiff was undoubtedly employed to do a large amount of work under the contract exceeding the amount of work which he would have had to do if employed to design a simple building to cost £25,000, and that £750, together with £100 for block plans, is too small a remuneration. I must also have regard to the usual scale upon which an architect of the plaintiff's professional eminence is

remunerated, and I come to the conclusion on the whole that the sum paid into Court—viz., £1,500—is an adequate and proper remuneration and compensation to the plaintiff in the circumstances of the case. As I have awarded to the plaintiff a sum in excess of the amount tendered, and as the defendants deny all liability, I give judgment for the defendant corporation in the action, with the general costs of the action, but I award the plaintiff the costs of the issue as to liability, and I will put the judgment into proper technical words to give effect to this decision.

COMPETITIONS.

Lay-out of Marine Estate, Douglas.

Professor Adshead's award in the competition for laying out the Villa Marine Estate, situated in the centre of the Douglas sea front (which was acquired by the Council a short time ago at a cost of £60,800) is as follows:—1, Messrs. Percy Robinson and W. Alban Jones, Leeds; 2, Mr. Stanley Ramsey, Herne Bay; 3, Messrs. John Casker and Harold Hill, Altrincham.

The New Town Hall for Marylebone.

At the last meeting of the Marylebone Borough Council it was decided to appoint a committee of nine members to deal with the question of a new town hall which is proposed to be erected. Councillor Fettes said that, as regards the assessor, his province would be to act as a sort of consulting adviser to the General Purposes Committee. They should advertise for a man who was a member of the Institute of Architects. They would be asked to draw up a scheme for the erection of the town hall and the Committee should go through the schemes and see which one they would accept. The Committee would then appoint an architect to bring up three or four schemes and the Council would have to decide which one they should adopt. The selection of the particular scheme, selection of the architect to carry the scheme through, and the selection of the contractor and builder, would be left to the Council.

The Soane Medallion.

At last week's meeting of the Royal Institute of British Architects the president announced that, the author of the drawings submitted under the motto "Civitas" having failed to comply with the conditions of the competition, and having retired from the competition, the Council have decided not to award the Soane Medallion this year. (The design was illustrated as the centre plate in our issue for January 25th.) Subject to the specified conditions, the Godwin Bursary (silver medal and £65) is to be awarded to Mr. Cecil Brewer.

LIST OF COMPETITIONS OPEN.

FEB. 15. JOINT ASYLUM, SWANSEA AND MERTHYR TYDFIL.—The visiting committee require an architect for the erection of a joint asylum to be situate at Cefn Coed, Cockett, near Swansea, to prepare designs, plans, specifications, etc., and to supervise the carrying out of the work. Applications, stating qualifications, experience, and terms, endorsed "Architect," to be sent on or before Wednesday, February 15, to W. H. Madge, Clerk, Guildhall, Swansea.

FEB. 25. COTTAGE HOSPITAL, ST. AUSTELL.—Architects practising in the County of Cornwall are invited to submit designs for a cottage hospital to be erected on the Trewoon Road, in the Town

of St. Austell. The estimated cost must not exceed £1,500. Three premiums, viz., £12 12s., £8 8s., and £5 5s., are offered for the three sets of plans which the committee may select, the premium of the finally selected architect to merge into commission. Designs to be sent to the Hon. Secretary, Mr. Henry Hodge, C.C., Trevarrick, St. Austell, by February 25th.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Premiums of £15 and £10 are offered. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee, E. Pearson, Corbridge.

MARCH 1. FREE LIBRARY, PENISTONE.—Competition limited to architects within thirty miles of Penistone.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 20.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Prof. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

SCOTTISH MEMORIAL TO KING EDWARD.

The Council of the Edinburgh Architectural Association have submitted to the Committee in charge of the Scottish memorial to King Edward resolutions to the following effect: (1) That the Council is gratified by the proposal to associate the memorial with Holyrood, with appropriate public access; (2) deprecates the proposal to erect a massive tower on the site of the ancient monastic gateway, as that would obscure the view; (3) considers that it would be unwise to remove the historic group of houses at the Abbey Strand; and (4) proposes that a select number of Scottish architects be asked to study the subject and submit designs for the general treatment of the project.

OBITUARY.

Mr. Henry Nicholas Hawks, I.S.O.

By the death of Mr. Henry Nicholas Hawks, I.S.O., which took place on January 30th, His Majesty's Office of Works has sustained a severe loss. Mr. Hawks entered the service of the Department in 1877, and was attached to the Scottish branch of the office in Edinburgh. After serving as architect and surveyor in Edinburgh for some years, during which time he was identified with the erection of many important buildings in Scotland, he was promoted to be architect and surveyor in charge of public buildings generally in the provinces. During this period of his service he designed and supervised the erection of the following buildings, amongst many others:—Custom House, Post Office, and Inland Revenue Office, Southampton; County Courts at Croydon, Swansea, Cardiff; Royal Naval College, Osborne. In 1907 he was placed in charge of the royal palaces, and most of the public buildings in London, with the exception of post offices, etc.; and whilst holding this post he was responsible for the erection of the new melting house at the Royal Mint, the Patent Office extension, and many large works of alteration and improvement to the Tower of London, and many other buildings of national and historical importance. But the most notable works entrusted to him during this period have been the extension and fireproofing of the National Gallery, and the erection of new offices for the Board of Agriculture. Unhappily in neither case has he lived to see the successful issue of his labours. The National Gallery works will not only provide much-needed additional galleries for the more effective display of the present collection of pictures and for the inclusion of further acquisitions, but the fireproofing of the previously existing galleries will ensure the adequate protection for all time of the national works of art from the risk of destruction by fire. The Board of Agriculture will, on completion, be one of the finest Government buildings in London. Its construction—a very intricate one, owing to the difficulties to be dealt with in connection with the foundations—presented problems which were happily solved by Mr. Hawks. In recognition of his services in designing and supervising the building of the Royal Naval College at Osborne, which in point of rapidity of construction was a remarkable feat, and in preparing the residence of the late Queen Victoria at Osborne for use as a convalescent home for officers of the navy and army, his late Majesty King Edward VII. appointed Mr. Hawks a companion of the Imperial Service Order.

R.I.B.A. Members.

At the meeting of the Royal Institute of British Architects on Monday, January 30th, the Hon. Secretary announced with regret the decease of the following members: Andrew Murray (A. 1872, F. 1899); Alexander Cunningham Forrester (F. 1904); Edward Skinner, of Ceylon (A. 1893, F. 1909).

The Late Mr. Colin Grant Patrick.

The late Mr. Colin Grant Patrick, of the old-established firm of Mark Patrick and Son, builders, of Westminster Bridge Road, who died on November 30th last, left estate to the value of £135,165 gross, with net personalty £127,408. Mr. Patrick had been in failing health for the past two years, and retired from business in

June last. The firm has been in business at Westminster Bridge Road for over eighty years, and previous to that in Belvedere Road, and has carried out much important work. Mr. Patrick was connected with many building enterprises, both in the City and West End. Since the retirement of Mr. Patrick the business has been carried on by Mr. W. S. Barton (for many years manager to Messrs. Mark Patrick and Son) under the style of Messrs. W. S. Barton and Co., and the offices have been transferred to 43, Chancery Lane, W.C.

Mr. Everett.

Mr. Everett, of the firm of H. Everett and Son, builders, Colchester, died on January 22nd, aged 56.

LEAD PAINT POISONING.

DEPARTMENTAL COMMITTEES APPOINTED.

The Home Secretary has appointed two departmental committees to investigate the danger attendant on the use of lead paints and compounds to persons engaged in painting buildings and to persons engaged in painting carriages and coaches. The chairman of both committees is Sir Ernest Hatch, Bt.; and Sir Godfrey Baring, Bt., Lord Henry Bentinck, M.P., and Mr. E. L. Collis, Medical Inspector of Factories, are members of both committees.

The other members of the committee on the painting of buildings are—Mr. F. G. Rice, President of the London Master Builders' Association and Representative of the National Federation of Building Trade Employers; Mr. W. G. Sutherland, Secretary of the National Association of Master Painters and Decorators; Mr. Archibald Gardner, Secretary of the Scottish Society of House and Ship Painters; Mr. J. Parsonage, Secretary of the National Amalgamated Society of Operative House and Ship Painter and Decorators.

Communications may be addressed to the chairman at the Home Office.

ARCHITECT, CONTRACTOR, AND
SPECIALIST.

In the King's Bench Division, Mr. Justice Bucknill recently heard the case of Carmichael v. Stonwood Patent Fireproof Flooring Co. The plaintiff, a builder and contractor, sought to recover £63 odd, alleged to be due under an agreement of March, 1908. Plaintiff built a house for a Mr. Buckley, in Hampshire, and defendants had laid certain patent flooring which they had guaranteed for three years: the defendants agreeing to refund the money paid them for laying the flooring if the building owner was dissatisfied with it, unless the architect decided that any faults of which complaint might be made were beyond the control of the sub-contractors. Complaints were made, and the architect, Mr. Reginald Blomfield, decided that the faults were not due to causes beyond the defendants' control.—Mr. Raynor Goddard, who appeared for the plaintiff, contended that the architect's decision was not an arbitrator's award, and that there had been no arbitration within the meaning of the Arbitration Act of 1889.—Mr. T. E. Forster, on behalf of the defendants, urged that there had been an arbitration, but that the decision should be set aside because the defendants had not been allowed an opportunity of rectifying the alleged faults.—Mr. Justice Bucknill held that the question of whether the causes of dissatisfaction were or were not

beyond the control of the defendants was a dispute to be decided by the architect. The enquiry should have been conducted in a judicial manner, and a signed award should have been made. The flooring having been taken up, no proper arbitration could now be made, and judgment must therefore be given for defendants, with costs. A stay of execution was provisionally granted.

GEOMETRY IN BUILDING WORK.

At a meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held on January 20th, under the presidency of Mr. John Bowman, Mr. David Skinner delivered a lecture, entitled, "Geometry in Building Work." He condemned rule-of-thumb methods, and advocated a more liberal use and application of geometrical principles. He divided his remarks into two headings, (1) elementary, and (2), higher geometry, illustrating the second part very fully by means of cardboard models and blackboard sketches. The octagon ventilator was described at some length, and the process of determining same was clearly illustrated, as was also the method of getting the bevels on louvres in triangular frames. The lecturer also touched upon the application to cones, circles, windows with splayed heads and sills, and centering for domes.

A. DAVIDSON, Hon. Sec.

CEMENT FOR INDIA.

The chief engineer recently reported to the vice-chairman of the Calcutta Port Commissioners that next year, when the entrance works for the new docks would probably be commenced, large quantities of cement would be required, and that a specification was being drawn up so that makers other than those belonging to the Associated Cement Manufacturers could tender. The matter came before the Commissioners at their last meeting, when it was decided that, in accordance with the chief engineer's recommendation, the tender of Messrs. Balmer, Lawrie and Co. for Gillingham Red Hand brand at Rs6-9-3 per barrel should be accepted. It was further resolved to authorise the chief engineer to purchase for purposes of trial in actual working 300 barrels of the cement offered by Messrs. Jessop and Co., namely "Invicta" brand, manufactured by the West Kent Portland Cement Co., at Rs6-8-0 per barrel delivered; also 300 barrels of "Gladiator" brand cement from Messrs. Kittel and Co., 5, Fenchurch Street, E.C., at Rs6-9-0 per barrel. The "Gladiator" cement is manufactured in Germany and in accordance with the German standard specification for Portland cement.

RIGHTS OF LIGHT CASE.

In the High Court of Justice on Friday last, Mr. Justice Eve delivered judgment in the case of Neale v. Willis and Sons, Ltd. Defendants had re-erected their building 22ft. higher than the former building, and plaintiff, a dealer in works of art, contended that the increased height would diminish the light coming to his windows. His lordship concluded: "I think on the whole evidence the plaintiff has failed to establish an actionable nuisance, and accordingly I dismiss the action with costs."

ADDRESS TO R.I.B.A. STUDENTS.

At the meeting of the R.I.B.A. on January 30, Mr. Leonard Stokes, president, delivered the annual address to students, and the criticism of drawings submitted for the Institute prizes and studentships, 1910-11, was read by Prof. C. H. Reilly, M.A. Cantab. Extracts from the address are given below. The criticism of the drawings is held over till next week, owing to pressure on our space,

The President said that, in his opinion, a student alone can rouse a student. Of course, even the youngest of us may make mistakes, but such mistakes are simple little howlers, which often set one thinking, and not the dull and heavy article produced by a President well over fifty. For this reason, therefore, he had a proposal to make—that next year the student under thirty years of age who can write the best address to his fellow-students shall read it to them, and have into the bargain, say, twenty guineas for his trouble, “and if the Council does not see its way to vote the money, I will guarantee that he gets it somehow. For his subject—if he wills it—he can remodel the Royal Institute of British Architects, and play any tricks he likes with it, and all its works and pomps. Further, I should like to suggest that the judges in this competition be under thirty years also, if that is not going too far, but perhaps you will leave this matter also to the Council and to me.”

The Light Touch of Youth.

The light touch of youth, so full of promise, so full of vigour and vitality, is worth a great deal in all forms of art; in fact, without it what should be a thing of interest becomes an object to deplore, and what should be a thing of beauty is often very far from it. Cultivate youth then, keep it green as long as you can, and water it well from the springs of learning, for study you must, and study hard too, if ever you hope to make yourselves felt in your generation.

“I am aware that there are many modes of study, and the form that suits one may not do for another, but in one way or another you must put your young shoulders to the wheel. Do not, however, try to be too clever and artistic—with a capital A—for nothing is worse than apparent effort in design. The simple, direct, and restrained, even if it does not catch the eye of the assessor, will do you more good to have achieved than half a dozen flashy productions, even if they get you the same number of commissions. Do not be in too great a hurry with your work, or too anxious to get it, but go steady, and never put your name to anything that is not of your very best; also remember that it is often just as important to know what to leave out of a design as it is to know what to put in, and that the one thing of all others to be careful about is proportion. The study of light and shade—a good stock phrase—is recommended by the faculty, but we have in our country so little light, and so much shade, that this fact alone should make us ten times more careful with our proportions.”

“Think for Yourself.”

In his youth he never had a good grounding in those delicious rules which give the right proportions for making everything, and he was unorthodox enough not to be a great believer in this rule-ridden type of learning; he would rather trust to the eye and its power of judging each individual case, than to the efficiency of a rule which probably has been educed from quite a different set of circumstances; what looks right in one case would be quite out of place in another, and although a rule may be all very well “to take off from,” the sooner we get clear of it the better. Always provided—as the

lawyers say—that we have trained our eyes and our judgment to do their duty properly. So whatever you do, think for yourselves. I do not for a moment suggest that you should try and be “original”! Heaven forbid! But I do maintain that you should be always thoughtful, and very careful. Please do not think that I want you to disregard what has been done in the past, for ours is a traditional art, and we must draw largely on the past if we hope to do better in the future. We should, however, use past examples intelligently and not blindly, even when we design on academic lines.

Architecture is a difficult thing to teach, as in our days it is such a comprehensive matter, but a smattering of a great many subjects is of no real use to an architect, unless such smattering is in addition to a real solid grounding in the “three R’s” of our calling.

A Word to the Successful.

A word or two to the prize-winners. I would say to these—beware! Many a good man has won prizes before, and never been heard of since; and the fact of your having got a prize to-day is only one more reason why you should work hard again to-morrow. It shows that you may be a man of parts, but what do we learn from men of parts in other callings? In the world of sport, for example, does the man who wins his heat to-day go on the spree, or does he train all the harder for the final struggle? You probably know the answer much better than I do. Skill of various kinds requires very careful handling, and I do not think that architectural skill is any exception.

Another pitfall is that travelling students often make poor use of their opportunities when travelling, and either go to the wrong places or spend their time in studying the wrong subjects. To guard against this the Records Committee is prepared to advise students where to go and what to do before they start on their travels.

Consolation for the Unsuccessful.

A word of consolation to those who have not been placed. You, at any rate, have escaped the awful risks which stare the winners in the face, and if you have any grit in you you will take your licking lying down. The line which divides a winning design from a losing one is often a very fine one indeed, and the very fact of having competed, and the spirit in which the result is taken, is what does the real good, and not the mere winning of the prize. So there is hope for all, including even the winners—perhaps; for study and hard work will turn the students of to-day into the Institute of to-morrow. “Personally—though I do not hold myself up by any means as a model—I believe I have learned far more from my fellow students, and friends, than I ever did from my teachers and masters.”

Architecture and Craftsmanship.

“I do not think we hear quite so much of crafts and craftsmanship now as we used to, and probably for the reason that we have steadied down somewhat, and now recognise that architecture after all is itself quite enough of a craft to demand our whole attention. It is not necessary to be a bricklayer in order to grasp the

limitations and proper principles of brick design, but it is necessary to know the size and shape of a brick before we can get very far on the architectural high road, and yet I have known young men in my time—otherwise very capable assistants!—who could not tell me the size of a brick.” As we have to do with all trades it is obvious that general and intelligent observation, combined with reading and lectures, can be about the extent of our mastery of so many subjects. Drawing is our mode of expression in our type of craft, and we shall find it very useful to be able to draw accurately and intelligibly.

A student’s life is not altogether a bed of roses; but it can be a very happy one nevertheless if only he takes a keen intelligent interest in his work. Architecture is a great and honourable profession, and it should be upheld by a fine honourable set of men. Play the game, therefore, strictly and straightforwardly; shun anything which in your own phraseology you would term “not cricket,” whether in connection with your work or your desire to get it. An architect has a number of great and ever-increasing responsibilities, and his client has to place implicit trust in him, and this trust should never be abused in the very smallest degree; for although it may be a fine thing to be a great architect and produce a quantity of really fine work, yet who after all is more respected and admired by all than the simple, honest, straightforward and upright English gentleman?

R.I.B.A. Gold Medallist.

It was announced that the Council propose to submit to His Majesty the name of Dr. Wm. Dörpfeld, of Athens (hon. corresponding member) as the recipient of the gold medal, in recognition of the distinguished services rendered to architecture by his archaeological researches.

LEICESTER SOCIETY OF ARCHITECTS.

This society opened its winter session on January 21st, with an address from the president (Mr. W. M. Cowdell, F.R.I.B.A.), and a musical evening in the society’s rooms, St. Martin’s East.

The President, in the course of his address, said that one of the objects of the society was “to maintain an acknowledged code of professional charges and prices.” Whilst far from suggesting that there was not ample ground for further progress, he thought those who cared to look back 25 years or so could not fail to recognise a very considerable advance in this respect. They had every reason to hope that the stand taken by the council of their society a year or two since, and the high standard of disinterested action taken by one or two of the most respected local members of their profession, though apparently unsuccessful at the time, could not fail in time to have a strong influence in the right direction, both with the general public and also in directing the conduct of any members of the profession who had overlooked the object of their society. Another object that had been kept well in view was watchfulness respecting competitions and other matters affecting the profession, and the endeavour to ensure equitable terms and awards.

A presentation was made to the retiring hon. secretary, Mr. W. K. Bedingfield.

The President, in handing Mr. Bedingfield a plaster portrait of his six-year-old daughter, which had been modelled by Mr. J. Crosland McClure, formerly of the Leicester Art School, referred to the excellent services Mr. Bedingfield had rendered the society during the past six years.

SECTIONS OF BEAMS OF GREATEST STRENGTH AND STIFFNESS.

BY H. SLICER, M.S.A.

The strength of a beam has been found to vary directly as the breadth, the square of the depth and inversely as the span.

For any given span the strength varies as the breadth and depth squared or as bd^2 , b =breadth, and d =depth.

There must therefore be some relation between these dimensions which will give to the beam maximum strength. This relationship is given in the text books as 5:7 (nearly), and the following shows the graphic proof of these figures. Let D be the diameter out of which a log is to be cut of maximum strength, and assume the diameter to be gins.

Then as the strength varies as bd^2

$$d^2 = D^2 - b^2 \quad \text{--- Euclid I. 47.}$$

$$\text{or } d = \sqrt{D^2 - b^2}$$

Call the value $bd^2 = y$

$$\text{then } y = bd^2 = b(D^2 - b^2).$$

Substituting gin. for D , and taking various values for b , we can solve the equation for y .

The values are as follows:—

b	0	1	2	3	4	5	6	7
y	0	80	154	216	260	280	270	224

Plotting these values on squared paper, we get a curve which reaches a maximum between 5 and 6. (See fig. 1.) This shows that between 5in. and 6in. broad the beam has a maximum strength, to be more precise, say, at 5.2 inches.

The depth has yet to be calculated for corresponding to this breadth, and this can

be done by dividing y by b (5.2in.), and obtaining the sq. root of the result, thus:—

$$y = bd^2 = 280.58 \text{ nearly,}$$

$$\text{and } \frac{y}{b} = \frac{bd^2}{b} = \frac{280.58}{5.2}$$

$$\therefore d = \sqrt{\frac{280.58}{5.2}} = 7.348 \text{ inches.}$$

The ratio of b to d is therefore as 5.196:7.348, or, as stated, very nearly as 5 to 7.

Stiffest Beam.

The stiffness of a beam is proportional to the breadth and the cube of its depth.

Using the same letters as before, the depth is again equal to

$$\sqrt{D^2 - b^2}$$

y now equals bd^3

$$\text{and } bd^3 = b(\sqrt{D^2 - b^2})^3$$

and taking the sq. root out of the brackets

$$y = b(D^2 - b^2)^{\frac{3}{2}}$$

Taking various values for b , D being gin., we get the following relations:—

b	1	2	3	4	5	6
y	715	1351	1832	2096	2096	1810

The maximum stiffness is, therefore, when the beam has a breadth between 4in. and 5in.

Taking $4\frac{1}{2}$ " as the breadth b , $y = 2100 = bd^3$.

$$\therefore \frac{bd^3}{b} \text{ (to eliminate } b) = \frac{2100}{4\frac{1}{2}}$$

$$\text{and } D^3 = \frac{2100}{4\frac{1}{2}}$$

$$\therefore d = \sqrt[3]{\frac{2100}{4\frac{1}{2}}}$$

$$\text{The log of } 2100 = 3.3222$$

$$,, \quad 4.5 = .6532$$

$$2.6890$$

dividing by 3 to obtain cube root gives .8896, whose antilog = 7.756in.

The breadth of the log cut out of a gin. diameter pole of maximum stiffness is $4\frac{1}{2}$ in., and its depth 7 $\frac{3}{4}$ in.

The ratio of b to d is as 1:1.7.

Marking out ratios graphically on log ends.

The ratio can be readily marked out on the log ends in the following manner:—

To mark out strongest beam.

Draw a diameter, and divide it into three equal parts. Draw perpendiculars on alternate sides of the diameter from the points marked 1 and 2 (fig. 3), and where the perpendiculars and diameter meet the circle, join, as shown, to form rectangle ABCD.

Then by Euclid I. 47 $AD = \sqrt{(AI)^2 + (ID)^2}$

$$\text{also } AB = \sqrt{(DB)^2 - (AD)^2}$$

$$\text{By Euclid II. 14 } AI = \sqrt{DI \times BI}.$$

Fig. 5.

Fig. 6.

Let $BD = 1$, then

$$AI = \sqrt{DI \times BI} = \sqrt{\frac{1}{3} \times \frac{2}{3}} = \sqrt{\frac{2}{9}}$$

$$AD = \sqrt{(AI)^2 + (DI)^2} = \sqrt{\left(\frac{\sqrt{2}}{3}\right)^2 + \left(\frac{1}{3}\right)^2}$$

$$\sqrt{\frac{2}{9} + \frac{1}{9}} = \sqrt{\frac{3}{9}} = \frac{1}{3}$$

$$\text{Also } AB = \sqrt{(DB)^2 - (AD)^2}$$

$$= \sqrt{(1)^2 - \left(\frac{1}{3}\right)^2}$$

$$= \sqrt{1 - \frac{1}{9}} = \sqrt{\frac{8}{9}} = \frac{\sqrt{2}}{3}$$

$$\frac{AD}{AB} = \frac{\frac{1}{3}}{\frac{\sqrt{2}}{3}} = \frac{1}{\sqrt{2}} = \frac{1.0}{1.415}$$

or a ratio of 5 to 7.

To Mark out the Stiffest Beam.

Proceed as for the strongest beam, but divide the diameter into 4 equal parts. (Fig. 4.) Let $BD = 1$.

$$AI = \sqrt{DI \times BI} = \sqrt{\frac{1}{4} \times \frac{3}{4}} = \sqrt{\frac{3}{16}} = \frac{\sqrt{3}}{4}$$

$$AD = \sqrt{(AI)^2 + (DI)^2} = \sqrt{\left(\frac{\sqrt{3}}{4}\right)^2 + \left(\frac{1}{4}\right)^2}$$

$$= \sqrt{\frac{3}{16} + \frac{1}{16}} = \sqrt{\frac{4}{16}} = \frac{1}{2}$$

$$AB = \sqrt{(BD)^2 - (AD)^2} = \sqrt{(1)^2 - \left(\frac{1}{2}\right)^2}$$

$$= \sqrt{1 - \frac{1}{4}} = \sqrt{\frac{3}{4}} = \frac{\sqrt{3}}{2} = .866.$$

The breadth is therefore $\frac{1}{2}D$, and the depth .866D, or the ratio is, as before stated, as 1:1.7.

By this means, any round log can be geometrically marked out for cutting up as required.

Diagrams 5 and 6 give the relative depths and breadths for maximum strength and stiffness, breadths being measured vertically, and depths to correspond being shown by the relative ordinates.

In works on mechanics it is shown that the horizontal shearing stress at any section is equal to the vertical shearing stress.

TRADE AND CRAFT.

Saxon Portland Cement.

The modern process of cement manufacture, as exemplified at the Saxon factories, Cambridge, is tersely summarised in the handsome new booklet that has been issued by this firm, whose products, as is recalled in the frontispiece, which shows the handsome diploma of the Japan-British Exhibition, were there awarded a gold medal. A comparison of the British standard specification requirements with the guaranteed specification of Saxon cement shows the latter to be far superior in every detail. A series of "Saxon Don'ts" represent so many terse aphorisms, in which much excellent practical information is conveyed in the fewest possible words. There is an abbreviated, but still extensive list of important works for Government departments, corporations, councils, railway companies, and other public bodies, as well as for private contracts on which this brand of cement has been used; and many of these are illustrated by means of handsome half-tone engravings, which, like the rest of the booklet, are finely printed. Several of the elevations shown are of considerable architectural interest, representing, as they do, some of the most noteworthy modern work.

A One-lever Motor Winch.

Messrs. Smart and Brown, engineers, etc., Erith, Kent, have issued illustrated lists showing and describing (1) various sizes and several applications of the S. and B. motor winch, which is fully controlled by one lever, is entirely self-contained, occupies very little space, and may be had portable, semi-portable, or fixed; (2) the Simplicity single-cylinder motor, a paraffin electric set, a 4-in. by 4-in. two-cylinder engine, which has been recently improved, and an oil-engine and centrifugal pump; and (3) a special list of paraffin electric sets, which take up little space and can be easily and cheaply installed. Builders and contractors will find in these lists many items of practical interest, seeing that, in modern building, the power plant is becoming everywhere indispensable.

Radiators and Heating Specialities.

The National Radiator Company, Ltd., whose general offices are at 439 and 441, Oxford Street, W., have issued their 1911 catalogue, giving particulars of "Ideal" radiators, boilers, and heating specialities. It is to be noted that this catalogue supersedes all former lists, considerable reductions in many of the prices having been made. Special attention is drawn to the "Ideal" domestic boilers, which are now supplied (without extra charge) with flanged covers instead of plugs on all clean-cut openings larger than 2 ins. All boiler fittings are now charged at reduced prices, whether with a boiler or ordered separately. Several new patterns of valves are shown, the new valves requiring, as compared with the earlier models, only about one-half the number of turns to secure full opening, while improved construction secures a combination of neatness with maximum strength. The catalogue, which contains 230 pages (4½ ins. by 7½ ins.), includes a very useful section giving such data and tables as will enable the proper apportionment of heating surface and boiler capacity to meet varying conditions. Altogether a valuable catalogue, of which architects and engineers will be glad to avail themselves, and to whom the firm will send it on request.

The vertical shearing stress is a couple, and as no rotary movement takes place in a beam, it must be balanced or kept in equilibrium, which is only possible by means of two forces, as one force cannot balance a couple.

The vertical shearing couple YX and xy (fig. 7), acting as indicated by arrows, must be balanced by the horizontal shearing couple Yy, and xX. These horizontal forces must of necessity be of equal magnitude to the vertical forces.

The vertical shear at any section of a beam is easily obtained either graphically or mathematically; it only remains to find how it is distributed. The tensional and compressional stresses in a beam are greatest at the lower and upper fibres of the cross section, and are specially provided for in steel joists by placing most of the metal in these positions. The shearing stresses are provided for by making the web of sufficient thickness to resist them. The maximum horizontal shear acts where there is neither tensional nor compressional stress, i.e., at the neutral axis. It varies from naught at the top and bottom of a beam to a maximum at the neutral axis, the variation of stress falling within the outline of a parabola for rectangular sections.

Taking a rectangular beam 7in. deep and 5in. broad, divide it into layers, say seven, and draw diagonals which give the resistance figure, the fibres within the double triangle being considered to be uniformly stressed. The horizontal shearing stress at any horizontal section, say xx, fig. 8, is obtained by erecting an abscissa equal to the area contained between and outside of the beam.

Horizontal shearing stress at—

$$XX = \frac{AB + XX}{2} = \frac{5 + 3.6}{2} = 4.3$$

$$YY = \frac{5 + 2.2}{2} = 3.6$$

$$ZZ = \frac{5 + .75}{2} \times 3 = 8.625$$

$$NA = \frac{5 + 3.5}{2} = 8.75$$

See fig. 9.

The horizontal shearing stress at each layer is distributed over the area of such layer, and therefore the intensity of horizontal shearing at each layer equals the horizontal shearing stress at each layer divided by the area of the layer.

Intensity of horizontal shearing stress at—

$$XX = \frac{4.3}{5} = .86$$

$$YY = \frac{3.6}{5} = .72$$

$$ZZ = \frac{8.625}{5} = 1.725$$

$$NA = \frac{8.75}{5} = 1.75$$

This is shown by the parabola, fig. 10.

For a beam of rectangular section the maximum horizontal shear which acts at the neutral axis can be obtained as follows:—

If R = total shearing or resistance to shearing at any vertical section,
fs = maximum intensity of shearing stress at neutral axis,
d and b = depth and breadth of section respectively.

$$\text{Then } R = fsbd$$
$$\therefore fs = \frac{R}{bd}$$

As the area of a parabola equals two-thirds of enclosing rectangle, therefore at the neutral axis $fs = \frac{3}{2} \frac{R}{bd}$.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

Mr. J. J. Wood on "The Guild of the Comacine Masters."

At a general meeting, held at the Leeds Institute on January 26th, Mr. Sydney D. Kitson, F.R.I.B.A., presiding, Mr. J. J. Wood, A.R.I.B.A., of Leeds, read a paper on the "Guild of the Comacine Masters."

As the Guild was always in league with the Church, it was not surprising to find that the most characteristic examples of the work of the guild were of ecclesiastical character; wherever Christianity had penetrated, throughout the ruined Empire of Rome, there the Comacine Masters had left their mark on Church architecture.

Vast as was the spread of their influence—affecting such widely separated districts as Lombardy, Sicily, Servia, Germany, France, and Britain, yet the presence of one immense organisation offered the only explanation of the otherwise inexplicable similarity of contemporary architecture in such places.

For administrative purposes, the guild was divided into lodges, each lodge consisting of a school where the traditions of the various crafts were taught, the general workshop, and the administrative office which constituted the link between the guild and its patrons. Under a president or Grand Master, the Magistri or members of the governing body of the guild organised the various works, while the Liberi Muratori—freemasons—carried out the different branches of the work. From the coming of the Longobards to Northern Italy in the sixth century, the Guild flourished until the dawn of the Renaissance, when, probably owing to its own unwieldiness, it broke up.

The concluding portion of his paper Mr. Wood devoted to Comacine work in the British Isles—citing and illustrating such well-known examples of Saxon-Lombardic work as Earl's Barton Church, Chapels at Bradford-on-Avon and Durham, and parts of churches at Sompting and Monkwearmouth, where, in characteristic tower, round arch, or type of ornamentation, the work of the Comacine Guild was unmistakable, while he believed that in Ireland the round towers owed their character as certainly as did the richly ornamented crosses to the same origin.

DEPOSITING CONCRETE BY GRAVITY CHUTES.

For handling and distributing concrete and delivering it into place in the forms, various arrangements of wheelbarrows, tracks, cars, and elevators are used, while in some cases conveyors have been used. A method of an entirely different character is that of raising the concrete to an elevated point and then distributing it to the forms by inclined chutes, through which the concrete slides by gravity. This method has been employed on a number of works of varying character, and has been made a speciality by the Concrete Appliances Company, of St. Louis, Mo. While the method is used by other firms, this company has developed and patented special apparatus and appliances for the

surface. By this flexible piping system the concrete can be delivered close to or at a distance from the elevator tower, and it is stated that it can be delivered in this way to a distance of 500 feet. For long distances, the pipes may be suspended from overhead cables and supported by intermediate towers. The various arrangements mentioned are shown in the figure, but for each job they are modified or adapted to suit the plan of the site and other conditions.

Means are provided for conveniently raising the hopper and pipes as the work progresses. Four vertical timbers (A), fitted against the posts of the tower and connected by the upper and lower trolley track (B) and (C), form a skeleton mast. This carries the boom and its guys, so that the mast and boom form a complete unit which can be raised by block and

at the material bins, one at the mixer, one at the hoist, one at the cage at the top of the tower, and two men handling the end of the discharge pipe (for each additional pipe there will be two more men). It is said that with this force of seven men, from 35 to 40 cubic yards of concrete per hour can be mixed and deposited in place. It is stated further that ten men under this system can place nearly twice as much concrete per hour as 35 men working with wheelbarrows or carts. It is also claimed that the cost of delivering concrete in place by this method is not much more than half that of the usual methods.

It is to be noted also, that each batch of concrete can be deposited in place at one operation, instead of by separate wheelbarrow loads. The delays usually involved in such work by the wheelbarrow

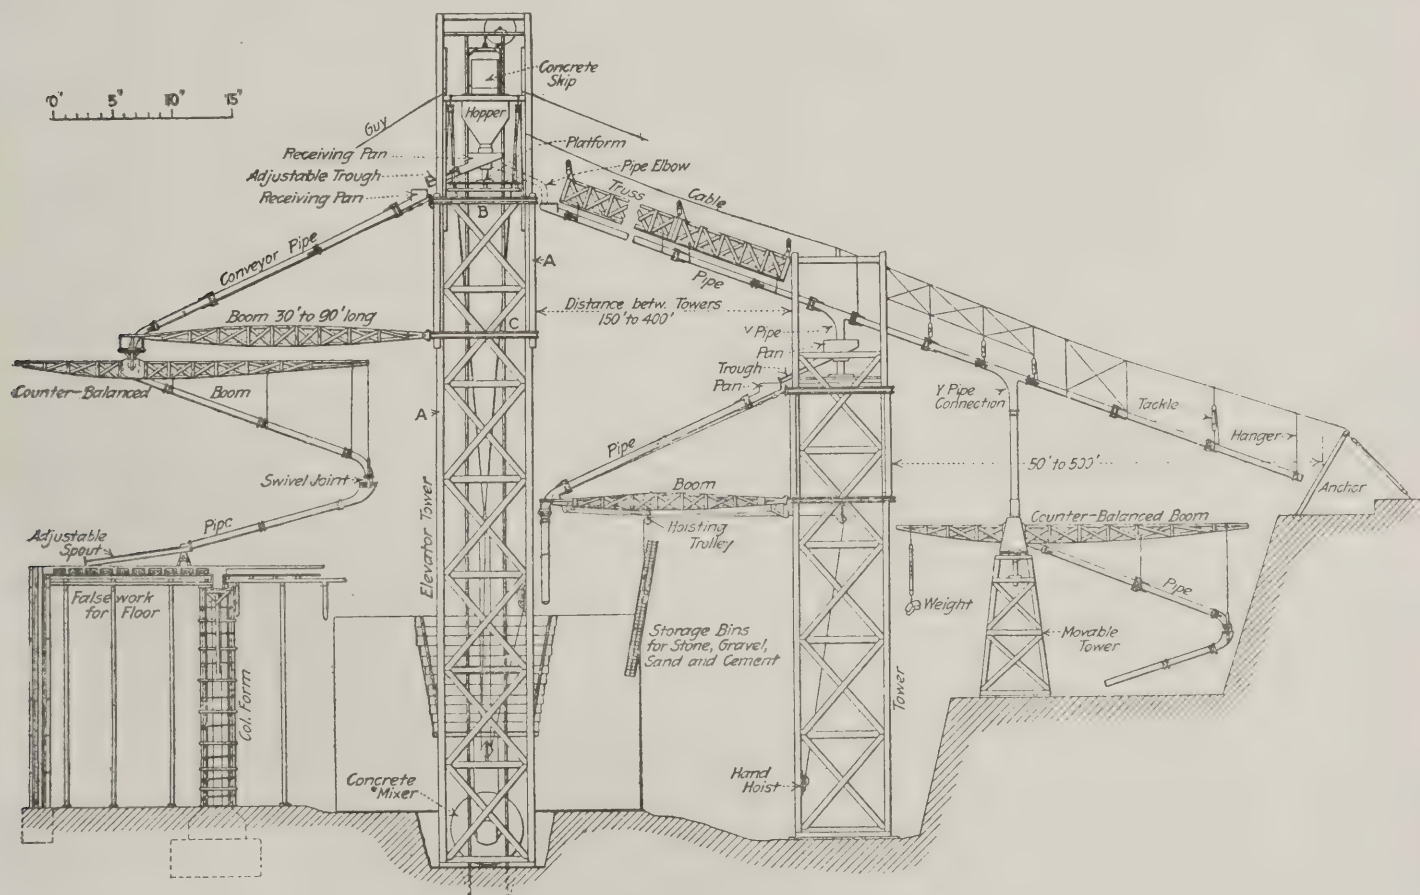

DIAGRAM OF PLANT FOR DISTRIBUTING CONCRETE BY GRAVITY PIPE CHUTES.

conveying and distributing of concrete by gravity.

A typical arrangement of the plant on this system is shown; but observe that the booms are now set at an incline, to reduce the thrust on the tower. The elevator tower (rectangular or triangular in plan) is erected on a convenient part of the site. The concrete from the mixer is delivered directly into the automatic dumping skip, and at the top of the tower it is discharged into a hopper. From the bottom gate of this hopper, it is discharged as required into a swivelling pan, and flows from this through a chute, or an elbow to receiving pans on the upper ends of the inclined conveyor pipes. These pipes are supported by booms, which also carry hoisting trolleys for handling the forms, etc. The pipe ends in a vertical drop sprout for filling column and wall forms, or it may have swivelling adjustable inclined spout for distributing the concrete over a wide area such as a floor

tackle as the height of the tower is increased. On some of the earlier work the boom step and guy were carried by trolleys, so that they could be moved to any side of the mast or tower. The moving was found to be inconvenient, however, and two booms are now fitted on opposite sides. The cage carrying the main hopper and receiving pan can also be raised by tackle. For buildings of small area, no booms are required.

There appears to be no trouble in the way of separation or segregation of the materials as the concrete slides down the pipe chutes. In fact, it is claimed that the churning motion in the pipes serves to agitate and mix the concrete during its travel; with this agitation and the speed of movement there is no opportunity for the concrete to be at rest and begin to set. Among the advantages claimed are rapidity of work and a reduction in the amount of labour required. The force for ordinary work will include two men

men waiting their turns at the mixer, the elevator, or the dumping point, are eliminated by this direct handling and distribution of the concrete. Other advantages are that large quantities can be handled quickly, the concrete in place is dense and homogeneous, the floor space is left unobstructed for the use of carpenters and other workmen, and damage to floors, etc., by wheeling over them, is avoided. The method is applicable to concrete and reinforced-concrete structures of all kinds.

In erecting a concrete building in Chicago, the Falkenau Construction Company used a main chute 10 by 18 ins., with auxiliary movable section in 13-ft. lengths. All these were open troughs, and the main chute extended from an elevator tower. The minimum and maximum angles of the chutes were about 8 degrees and 25 degrees respectively. So far from the travel of the concrete in the chutes having any tendency to cause segregation, it appeared rather to mix more thoroughly.

NEWS IN BRIEF.

Northern Architectural Association.

The presidential address delivered by Mr. H. C. Charlewood, F.R.I.B.A., before the members of this Association in November last has now been issued in pamphlet form.

Economical Reinforced Concrete Design.

In publishing the article under this heading in our last issue, we omitted to state that the author was Mr. G. A. Clark, by whom it was originally contributed to the Magazine of the Old Students' Association of the Finsbury Technical College.

Royal Institution Lectures on Architecture.

At the Royal Institution, Finsbury Circus, Mr. T. G. Jackson, R.A., will deliver three lectures on "Byzantine and Romanesque Architecture," on Saturdays, February 11th, 18th and 25th, at 3 p.m.

Moving Stairways on the District Railway.

At Earls Court Station the District Railway Company are having constructed moving stairways for conveying passengers between the District and the Piccadilly Railway stations. It is intended to put such moving staircases into various stations where they are required if the experiment at Earls Court is successful.

A Picture by Mr. Solomon.

To the series of frescoes representing scenes and incidents in English history which adorn the main corridors of the Houses of Parliament, is about to be added a picture by Mr. Solomon J. Solomon, R.A., representing Queen Elizabeth as the central figure supported by the entourage of the Court. It is a large work, 8 ft. 6 in. by 14 ft., and will occupy the large panel on the top landing of the grand staircase.

Some West-End Street Widening.

The Westminster City Council has prepared for submission to the Road Board under the Development Act, schemes for improvements which are estimated to cost £250,000. They comprise a general widening of Piccadilly from 79ft. (the present width) to 90ft. between the Ritz Hotel and Park Lane; the widening of Berkeley Street from 37ft. to 50ft., by moving the boundary wall of Devonshire House and Lansdowne House; and the widening of Argyll Place (between Regent Street and Great Marlborough Street) to 60 ft.

Town Planning Exhibition at Chelsea.

Under the direction of a Committee, of which Mr. Raymond Unwin and Professor Geddes are the moving spirits, a town planning exhibition has been arranged in Crosby Hall, Chelsea (nearest railway station Sloane Square), and is now open until February 25th from 2 to 6.45 p.m., and from 8 to 10 p.m.; admission 6d. The exhibits will subsequently be taken to Edinburgh, where they will be shown in the Royal Scottish Gallery at the Mound, the Town Council having agreed to bear the cost of £300 that will be incurred in doing so.

The Tomb of Queen Victoria.

About 5,000 persons visited the Royal Mausoleum at Frogmore on January 25th to see the sarcophagus in which the body of Queen Victoria has been placed. A number of alterations have been made in

the mausoleum, the designs of which were approved by King Edward. These include the decoration of the dome above the tomb of Queen Victoria with panels of angels, some of the figures holding Imperial crowns and others wreaths. The stained glass windows have also been completed. The designs are those of Mr. Ion Pace. At the approach to the mausoleum two lamps of Byzantine pattern have been erected.

"Marmo" Facing for City Buildings.

In Fulham Road, London, S.W., attention is at once arrested by the new building which has been erected for the Michelin Tyre Co., Ltd., from designs by Mr. J. Espinasse, architect, of Clermont-Ferrand; the facing being executed in Burmantoft's "Marmo" in several colours, with emblematic and heraldic panels, supplied by the Leeds Fireclay Co., Ltd. This new form of terra-cotta has a pleasing surface which successfully resists the action of the weather and—what is of special importance—can be periodically cleaned of all soot and dirt. It is thus especially suitable for city buildings.

A Relic of Mediæval Architecture.

The National Trust for Places of Historic Interest or Natural Beauty (25, Victoria Street, London, S.W.) are appealing for funds for the acquisition of The Old Priest's House, Muchelney, Somerset, an almost untouched relic of mediæval architecture. The Society for the Protection of Ancient Buildings consider the preservation of the house to be a matter of such importance that they have undertaken to bear the cost of putting the building into repair if the property is acquired by the National Trust. In addition to the actual cost of purchase, a small sum will be needed to cover legal and other preliminary expenses, and the council accordingly appeal for £250. Donations may be sent to Mr. Nigel Bond, secretary of the Trust, at the above address.

A German Town Planning Tour.

The Garden Cities and Town Planning Association have arranged for a town planning tour in Germany during the forthcoming Easter, starting on Thursday, April 13. The towns which it is hoped to visit include Essen, Cologne, Dusseldorf, Frankfurt, Mannheim, Heidelberg, Ulm, Nuremberg, Stuttgart, and Dresden, with excursions from these centres to industrial villages and other places of interest in the neighbourhood. The primary object of the tour being an effective study of town planning powers and possibilities, membership will be confined to those having direct interest in the subject, in its various aspects. Ladies will be welcomed among the party. In order to provide for both those who would wish to return early, and for those who would desire to make a more prolonged study, the tour will be divided into two parts, the first party returning from Frankfurt or Mannheim. The price for the first portion (nine days) will be eleven guineas, and the extension (a further five days) five guineas. This price will include second-class railway throughout and first-class steamer, hotel accommodation and meals, gratuities to servants, etc., and conveyances to the various towns visited. All applications and inquiries should be addressed to Mr. Ewart G. Culpin, secretary, Garden Cities and Town Planning Association, 31, Birkbeck Bank Chambers, Holborn, London, W.C.

GLOUCESTER ARCHITECTURAL
ASSOCIATION.

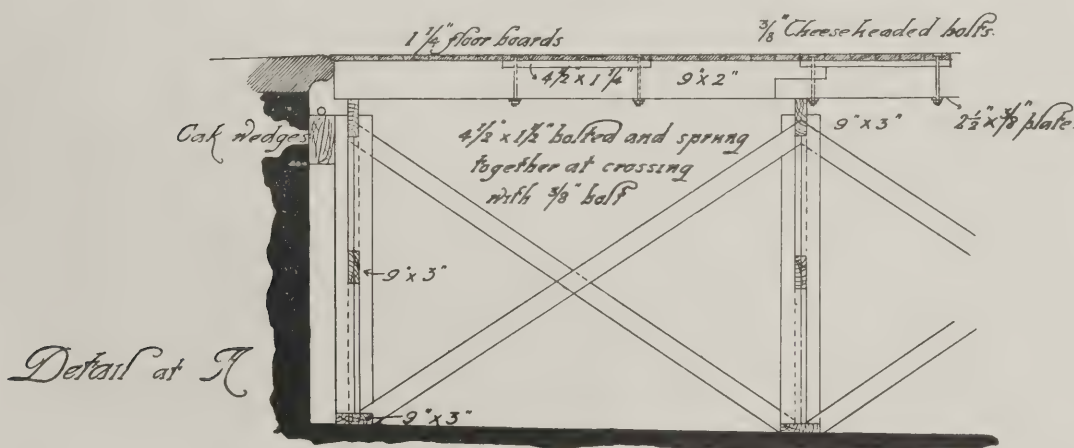

The fourth annual general meeting of the Gloucestershire Architectural Association was held on Thursday, January 26th, at the Northgate Mansions, Gloucester, Mr. H. W. Chatters in the chair. Mr. Walter B. Wood, of Gloucester, was elected President for the coming year, and Messrs. H. A. Jancey and T. Overbury Vice-Presidents; Messrs. W. F. Jones, S. H. Healing, and J. Fletcher Trew were elected Members of Council; Mr. H. W. Chatters was appointed hon. corresponding secretary for Cheltenham, Mr. G. P. Mines for Stroud; and Mr. Harold S. Davis hon. secretary and treasurer.

Longitudinal Section (Transverse Strutting omitted)

Plan. showing division of covering

It is common practice to utilise swimming baths for concerts, etc., in the winter, and for this purpose the area is floored over. There are several methods of forming such temporary floors, but the one here shown is the best. The construction is extremely light, and can be easily removed and re-erected. The drawing is self-explanatory.

TEMPORARY FLOOR OVER SWIMMING POND, PUBLIC BATHS, PITFIELD STREET, HOXTON, LONDON, N.
ALFRED W. S. CROSS, M.A., F.R.I.B.A., ARCHITECT.

BOOK NOTICES.

Complete Drawings of a House.

This book, which has been prepared for the instruction of students in obtaining "an intimate knowledge of all the drawings necessary for the erection of a building," is in small folio form, and consists of a complete series of figured working drawings for a tolerably large dwelling-house, accompanied by descriptive letter-press.

This is very completely done; the series commencing with a block plan of the site of the house and the laying out of the garden, going through the successive large-scale plans, the elevations, the decorative treatment of the principal rooms, and the constructional details of windows and doors, pilasters, panelling, etc. The constructional details are all very fully and completely given, and will be very useful to architectural students, though some of them are details of things which, if they are not actually old-fashioned now, ought to be so. We have, for example, sections of fluted pilasters in $1\frac{1}{2}$ in wood jointed at the angles and with large empty spaces behind them; and nearly all the windows are shown in detail with the hollow "boxing and casing" and hanging weights which ought to be obsolete now, when there are so many better ways of making windows. However, it may be answered, no doubt, that as long as these methods of decoration and construction are employed, students must know how to make them properly. On the other hand, $2\frac{1}{2}$ in. wooden balusters to a stair of which the steps are formed of marble slab treads and risers on a steel-concrete structure, strike us as an undesirable novelty; steps of that kind should either have had marble balusters or a forged metal ramp; the wooden balusters are quite out of keeping. In regard to the drawing-room, which is to be painted white and finished in "Adam style," it seems to us that to use mahogany or walnut wood for this painted work is to throw away woods which have a fine colour and figure of their own, which it is a pity to cover with paint.

The minute way in which the bathroom and sanitary and drainage fittings are detailed in the drawings is useful, and adds to the practical value of the book.

We presume that the plan of the house is not necessarily intended as a model plan, but only as a means of showing drawings; it should not be taken as a model in all points, at all events. To begin with, it repeats the mistake we so constantly see in house-planning, of giving the principal windows of the dining-room and drawing-room the same aspect—making the two rooms face the same way, which should always be avoided if possible; they are rooms used for different purposes and at different times of day, and require a different aspect. North-west is not the best aspect for the kitchen window, but the author has remembered to give a top-light over the kitchen range, otherwise the principal window would be quite in the wrong place. The door into the lavatory, from the entrance-hall, opens the wrong way, right on to the lavatory basin, which would be seen all across the hall; and the same with the w.c. door within the lavatory, which also ought to open with its back to the seat, the reverse way to that shown on the plan; it is odd how often little things of this kind are overlooked in planning. The author has made a good point, however,

in arranging the dining-room door and the staircase, hall, and corridor, so that as he says, a vista through the whole length of the house can be obtained.

In the bedroom plan it is absurd that while the smaller bedroom, on the right of the plan, has a dressing-room communicating with it, the largest and principal bedroom, on the left of the plan, should have no dressing room attached to it; for a first-class house this is not commendable planning, and we question whether the plan of placing all the beds facing the windows is desirable. In summer it is difficult to prevent early morning light from filtering through shutters and curtains, with the result of waking the sleeper unseasonably, if right in his face.

These points do not affect the practical usefulness of the book for the object for which it was intended, but students should be cautioned not to take the plan in itself as a model.

The Construction of a House: Being the study of Building Construction presented by means of a set of forty plans and detail drawings of a design for a country house. By Charles Gourlay, A.R.I.B.A. London; B. T. Batsford, 1910.

The English House.

There seems to be constant production at present of books on the home, on small houses, on bungalows, etc.; some of them sentimental, some of them in the nature of advertisements; few of them of much value. It is not easy to understand what is the object of the present one. It is of no use to architects, as it only deals in generalities such as are familiar to them, and the examples show a good many instances of poor planning, rather to be avoided than followed; and at the same time it is too professional to be attractive to the general reader—or so we should have thought; but the Duke of Argyll, who writes a complimentary preface, seems to think that it "may enable some of us to have more or less mature ideas of our requirements before we consult with our architects." That is hardly an idea that will be welcome to the architects. Generally speaking, no client is more troublesome than the one who comes primed with a little superficial knowledge out of a book, and on the strength of that wants to instruct his architect.

The short sketch of the history and development of the English house, in its main features, is adequately done, and the general directions as to the treatment of the various parts of the house, though they are somewhat commonplace, are what one can agree with. Hollow walls should not have been referred to and illustrated without mention of the fact that there are objections to their use at all, strongly held by many persons, and to our thinking, with reason. We are glad to see that the authors, in dealing with the subject of water supply, recognise how inadequate is the present notion of water-supply per head for towns. In mentioning 35 to 50 gallons per head per day, they are putting the case far too favourably; very few water engineers or water authorities would consent to consider the latter figure; many of them grudge the 35 gallons.

We agree with the authors that the most prevalent fault in modern architecture is the striving after picturesqueness for its own sake; but we do not know whether the striving after "the long and low effect which is so much admired in the old farm-

houses" is not a convention of rather the same kind; and the advice to make rooms "as low as you dare" is a fashion of the day, a reaction against the opposite fault, which will change again, like other fashions.

In the plans given as illustrations, we find a constant repetition of what we noticed in Mr. Gourlay's plan of a house, the idea that the dining-room and drawing-room should have the same aspect, and even be symmetrical repetition. In turning over the plans we notice a good many doubtful or more than doubtful points: e.g. (Fig. 186) a kitchen with a south light and the light on the right hand side of the range—the most inconvenient way to plan a kitchen; Fig. 197, dining-room, drawing-room, and kitchen, all with the same aspect—no north point is given, but the aspect must be wrong for one of them at all events; Fig. 193, a water-closet door at the end of the vista of a long passage; Figs. 293, 294, quite undesirable planning; Figs. 297, 298 (same architect), equally naive planning, and the kitchen range at the farthest point opposite the window, so that the cook stands in her (or his) own light; Fig. 310, dining-room all window on the south side, and kitchen with a large window looking west; Figs. 325, 326, planning like a simple attempt at dividing up a space into rooms.

The proportion in the authorship of the illustrative designs is rather striking; there in one house design by Mr. Lutyens, and there are sixteen by the authors.

The English Home. By B. F. Fletcher, F.R.I.B.A., and H. P. Fletcher, F.R.I.B.A. London; Methuen and Co. 12s.

"The Year's Art."

This is one of those reference books that we cannot do without. Now in its thirty-second year, the volume furnishes the essential particulars of all the art societies, schools, and other similar institutions throughout the Kingdom, with information about the national art collections, and, at the end, a directory of artists and art workers which is of the greatest use, as without "The Year's Art," one would be often at a loss to find such names and addresses; no other volume contains so complete a list. There are, also, the other regular features of the publication, the new edition including an epitome of events in the art world during the past year, and a chronicle of the most important art sales. Throughout the volume are interspersed five plates, these including three Corots and two Daubignys.

If there is any criticism we have to make, it is that the insertion of three pages of advertisements between the list of contents and the diary at the front is undesirable, as it makes it difficult to find the contents page, and, in the same way, the index is mixed up with the advertisements at the end of the book.

The Year's Art, 1911. Compiled by A. C. R. Carter. London: Hutchinson and Co., 34, Paternoster Row. Price 5s. nett.

Quantity Surveying.

The extreme cheapness of this manual may doubtless commend it to students; but the obvious disadvantages are seen in the small type into which it has been necessary to compress the information, and may perhaps be inferred with regard to the attractions the low price may have for persons who otherwise might not be tempted to dabble in a subject that is best left to the professional expert. The editor seems to have anticipated the latter ob-

jection, for he says in his foreword, "The professional quantity surveyor fills a recognised and useful place in the building world, but it is neither desirable nor necessary that the architect and builder should be continually dependent on his services." We cannot unreservedly subscribe to this specious plea; and when the editor, waxing momentarily bolder, goes on to say that, "A careful study of the notes and examples given in this little work would qualify any intelligent student to do his own quantity surveying," we feel impelled to enter our caveat. The author, however, seems to have done his work very well, and his booklet may possibly serve the quite legitimate purpose of helping young builders to a wider understanding of their own proper business.

Quantity Surveying. By George Metson, M.R.San.I., with numerous illustrations by the Author. 120 pages, 6d. John Dicks Press, 8, Temple Avenue, E.C.

Spons' Pocket Price-Book and Memoranda.

The value of a price-book that can be conveniently carried in the pocket has been so plainly established, that the compilers of Messrs. Spons' Price Book, when they found that the continual increment of matter was likely to make it unduly bulky for this purpose, did not hesitate to adopt a bold remedy. They divided the book into two sections, each slender enough to vindicate its claim as a genuine pocket-book, and each having its own well-defined scope. The green volume is called the "Architects' and Builders' Pocket Price Book," and the red volume is the "Memoranda Section"—a very rational division of subjects. If it were objected that, as a rule, the same man will require both volumes, the answer might well be that he can easily carry both, either together or, more comfortably, in separate pockets. In each instance the matter has been very ingeniously arranged to facilitate ready reference, the bold-type marginal headings being in this respect particularly helpful.

Spons' Architects' and Builders' Pocket Price Book and Diary, 1911; and Spons' Architects' and Builders' Pocket Book, Memoranda Section, with Tables, etc. Both edited by Clyde Young, F.R.I.B.A., and Stanford M. Brooks, L.R.I.B.A. London: E. and F. N. Spon, 57, Haymarket, W.

Where to Live.

The issue of a third and revised edition of "Where to Live Round London (Northern Side)," which is No. 2 of the series of "Homeland Reference Books," is a sufficient attestation of the merits of a rather novel conception, which owes something to the ordinary guide-book, something, perhaps, to the directory, and a great deal to the spirit which gave life and motion to the Town-planning Act. A judicious combination of these elements gives a book of a novel character, to meet the modern requirements that have arisen out of the improved facilities for transit, and the consequent expansion not only of London, but of the citizen's bump of locality. Formerly, the selection of his dwelling-place was pretty much a matter of "Hobson's choice"; now, within certain by no means narrowly restricted limits, he is free to choose some favourite spot wherein to take his rest and enjoy his leisure, and the books in this series provide him with exactly the data which will enable him to make up his mind on the subject. Each district is described in alphabetical order, and a concise account of its natural features is supplemented by information on all the points which natur-

ally arise when one is contemplating a change of residence—such as railway distance and fares (season and ordinary), rents, rates, price of gas, population, death-rate, educational facilities, places of worship, recreations, institutions, etc., etc. The "Round London" of the title is construed very liberally, the horizon including such "distant views and prospects fair" as those that are offered by Aylesbury, Bishop's Stortford, Dunstable, and Wendon. Several maps are usefully included, and there are a good number of half-tone views.

Where to Live Round London: Northern Side. Third and Revised Edition, 1910-11. With a chapter upon the Geology and Subsoils, by O. A. Shrubsole, F.G.S. Edited by Prescott Row and Arthur Henry Anderson. Pages xviii.—255, 7½ ins. by 5 ins., 1s. The Homeland Association, Ltd., Chandos Chambers, 15, Bedford Street, Strand, W.C.

"The Heel of Italy."

The author of this thoroughly interesting book is to be congratulated both upon his good fortune in discovering an almost unknown district of Italy that was worth investigation, and on the admirable use he has made of his opportunities. Although Italy, as the cradle of the arts, has been, as regards its beaten tracks, rather overdone by the book-producing traveller, Mr. Briggs's lucky experience seems to suggest that there may still be some parts of the country that have been overlooked by the crowd of writers on art and archaeology, who, as a rule, have in them so little of the spirit of the pioneer that they seldom deviate from the main-travelled road, and even on that can never see anything but the show-places that are specially pointed out to them. Mr. Briggs does not for a moment claim that Lecce is obscure and inaccessible. It enjoys, in fact, a very good train service. It is only "unknown" in the sense that hitherto it has not been made the subject of a book; and that its remarkable history, and its even more remarkable buildings, have never before been put to this good use, the wonder grows as one turns over Mr. Briggs's well-stored pages of clear description and striking illustration. Most of the pictures, whether from photographs or whether from the author's vigorously drawn sketches, are of architectural interest, although the appeal is to the art-loving portion of the general public—a fact that probably explains the absence of plans. There is, however, an appendix on "Architectural and Historical Notes on Lecce Buildings," while the bibliography includes a section on "Books dealing with Baroque Architecture."

In the Heel of Italy.—A study of an Unknown City. By Martin Shaw Briggs, A.R.I.B.A., Associate of the British School at Rome, and Extension Lecturer to the Universities of Oxford and Leeds. With 26 drawings by the Author, and 19 photographs. London: Andrew Melrose, 3, York Street, Covent Garden, W.C. gins. by 6 ins., 8s. 6d. nett.

Sewage Disposal Works.

The principles of sewage disposal having emerged recognisably from the welter of divergent and to some extent tentative practice of the many and various "schools," it is now possible to present them in something like settled and coherent form, and this has been, in fact, done almost *ad nauseam*. Mr. Easdale deserves our gratitude, therefore, by his wise decision to avoid a repetition of the usual preliminary details as to the nature of the problem to be solved. He has, in fact, spared us the inclusion of matter that is so far superfluous as to be absolutely skipped, or at least glanced through with

a good deal of impatience, by the majority of readers, and has confined his attention to descriptions, illustrated with drawings and photographs, of the various tanks, chambers, filters, beds, and other details of sewage works, including the numerous types of appliances required in connection with them. The author further points out that he has also departed from the common practice of illustrating actual works, for the reason that these are usually adapted to special circumstances, and are confined to special systems; whereas it must often happen that, in order to meet different conditions, it would be better to follow the suggestions put forward in diagrammatic form; and sometimes it might even be found advantageous to combine certain features of several systems. The various sections of the book deal respectively with screens, storm-water overflows, detritus and other tanks, sludge disposal, percolating filters, effluent settling tanks or humus pits, sand filters, contact beds, storm-water treatment, measuring apparatus, and the sterilisation of sewage effluents. The treatise will be found scientific, practical, and luminous.

Sewage Disposal Works: Their Design and Construction. By W. C. Easdale, M.S.E., M.R.San.I. With 155 illustrations. London: E. and F. N. Spon, Ltd., 57, Haymarket. Pages viii.—256. 5½ ins. by 8½ ins. 10s. 6d. nett.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

The annual meeting of the members of the Devon and Exeter Architectural Society (embracing the counties of Devon and Cornwall) was held at the Central Hotel, Lockyer Street, Plymouth, on Saturday, January 28th, the President, Mr. William H. May, M.S.A. (of Plymouth) in the chair.

The hon. secretary presented the annual report, from which it appears that the membership at the end of 1910 was 79, as compared with 77 for the preceding year. The rules have been revised in accordance with suggestions made by the Council of the R.I.B.A., and a regular scale of charges for quantities has been adopted.

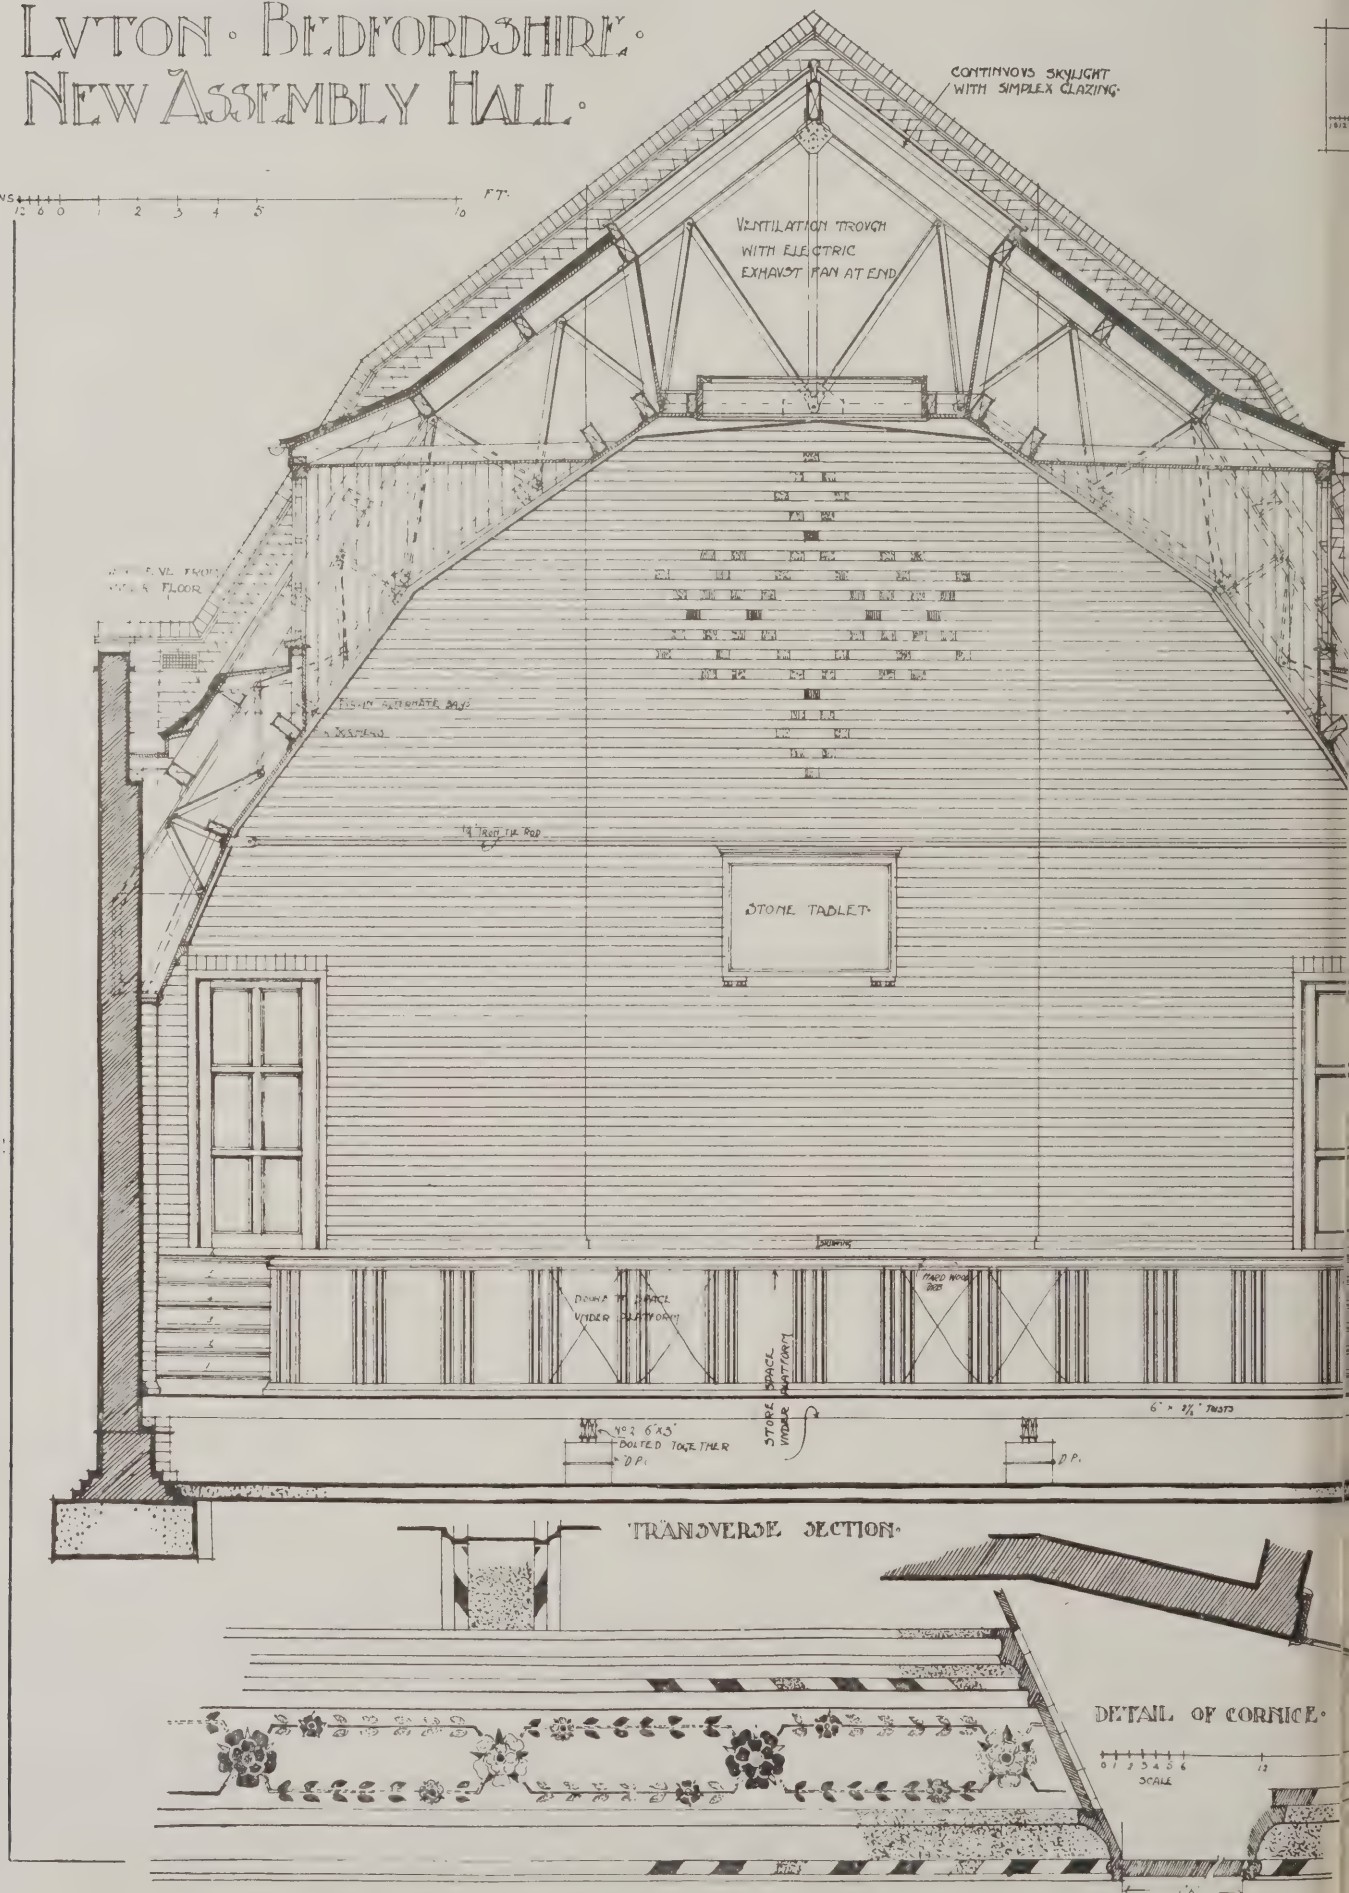

The retiring president, Mr. W. H. May, then delivered his address, which was chiefly devoted to local matters, but included references to the Copyright Bill, Registration, and other national topics. Concerning copyright, Mr. May said:

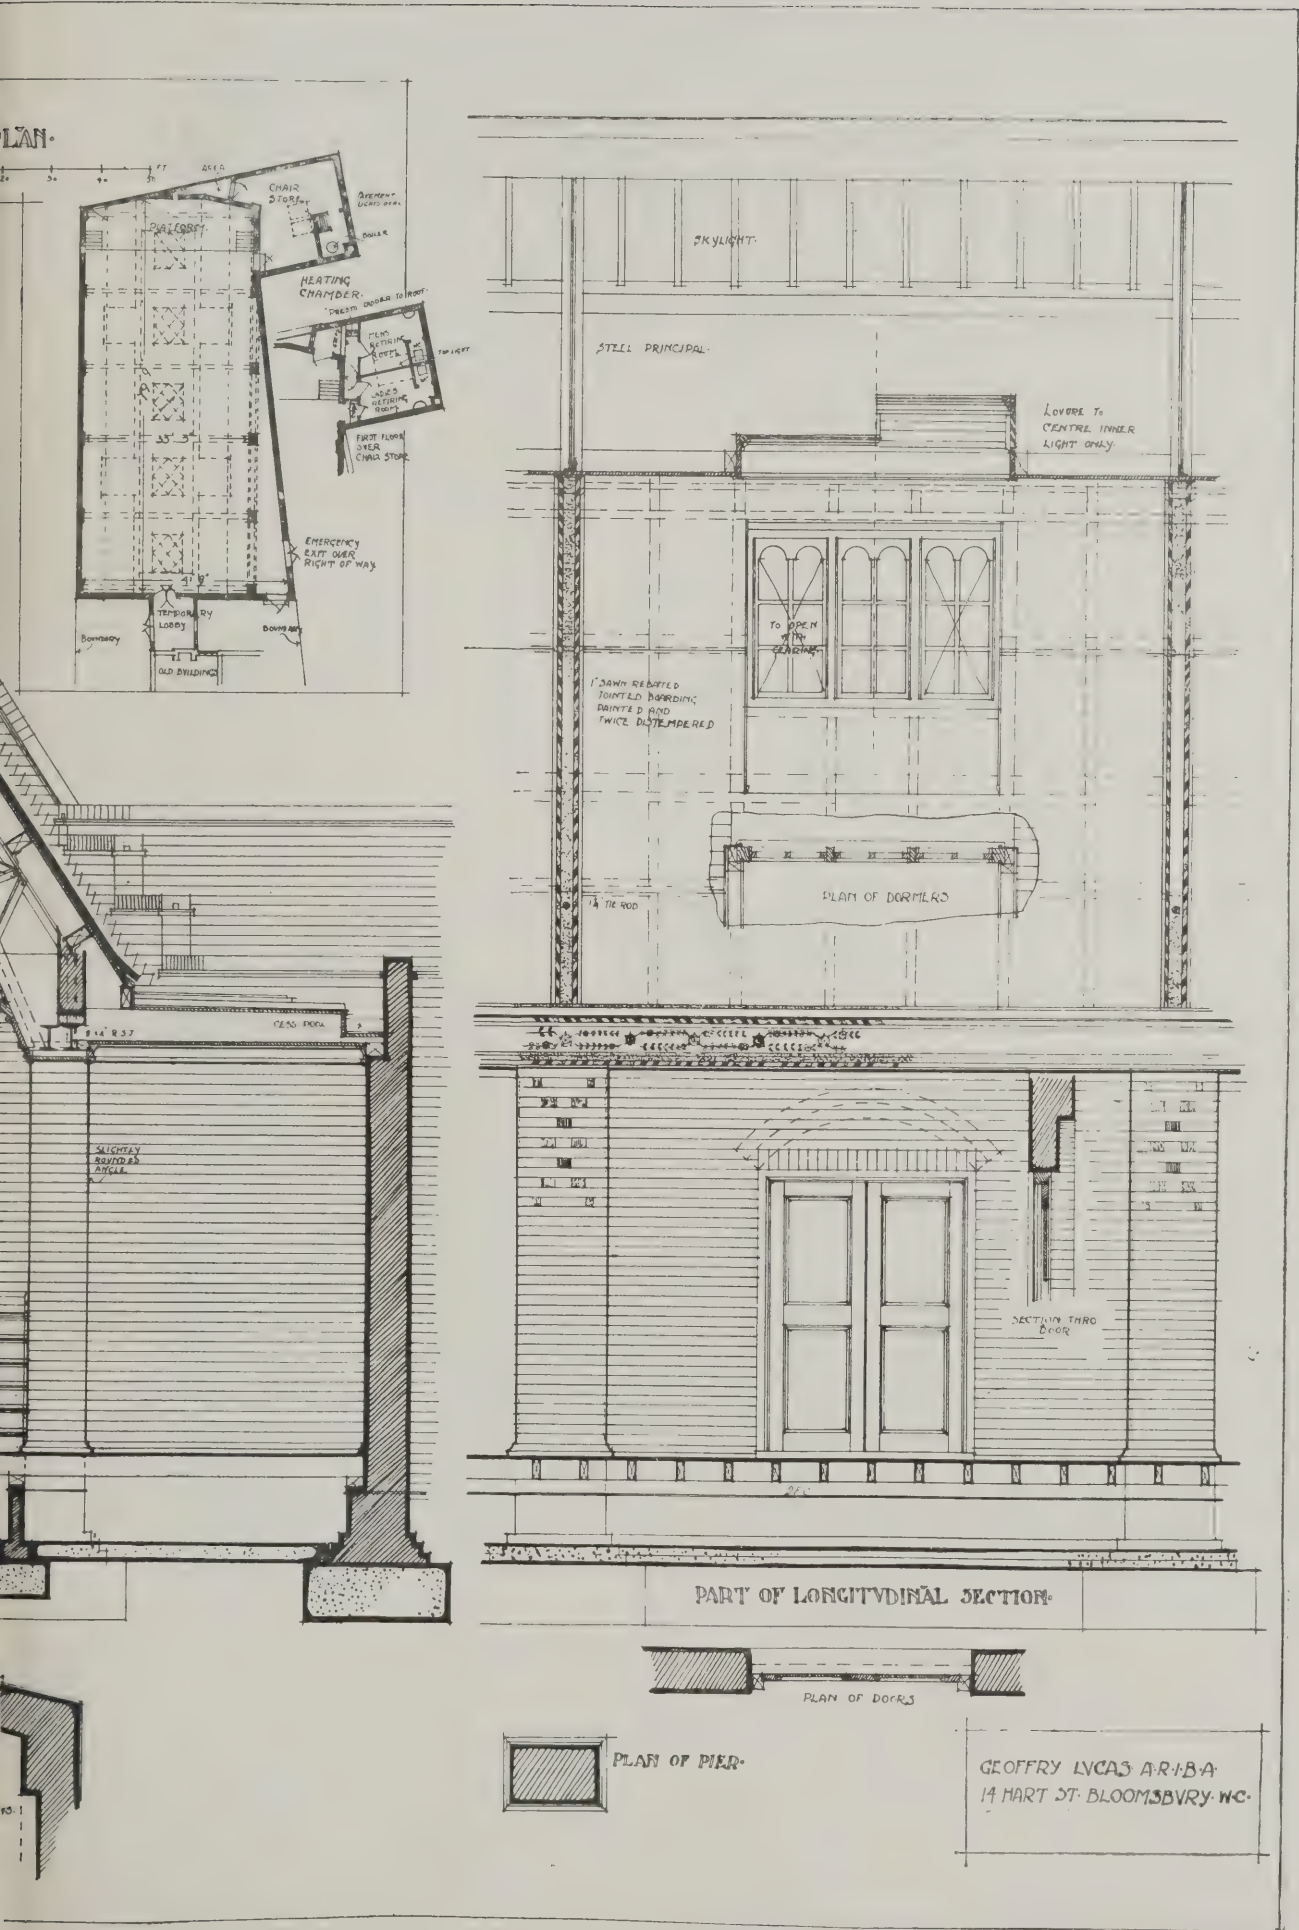

"The Royal Institute Committee has given most careful attention to the Copyright Bill, and it is to be reasonably surmised that at some future date, when either in this Parliament or some other, the Bill is again heard, the action of the Royal Institute will not be disregarded."

Mr. James Jerman proposed a vote of thanks to the retiring President for his excellent address, and also for his valuable and untiring services in presiding over the society during the past year, which was seconded by Mr. John M. Pinn, supported by Mr. B. F. Shires, and carried by acclamation.

The following officers and Council were elected to fill the vacancies of those retiring:—Mr. James Jerman, F.R.I.B.A. (Exeter), president; Mr. E. Coath Adams, M.S.A. (Plymouth), vice-president; Messrs. H. L. Thornely, F.R.I.B.A. (Plymouth), Sampson Hill (Redruth), H. Watts, A.R.I.B.A. (Plymouth), Mr. S. Dobell (Exeter), hon. treasurer, and Mr. Allan J. Pinn, A.R.I.B.A. (Exeter) hon. secretary.

CONTINUOUS SKYLIGHT
/ WITH SIMPLEX GLAZING.

The roof over this hall is a very effective one, designed and carried out with great care. Owing to the position of the hall it was impossible to light it by windows in the walls. Light, therefore, is admitted through a continuous skylight (as shown by the drawing on the preceding page), with inner lights in the ceiling. Four dormers are also arranged in the roof. The space between the inner ceiling lights and the continuous outer skylight is utilized as an extract shaft. There is an electric fan at one end, which withdraws the vitiated air through louvres in the centre inner ceiling light, while fresh air is admitted through ducts taken from the end walls to behind the radiators. By these means the air in the hall can be changed three times per hour without draught. The construction of the roof is with steel principals, boarded over, tie-rods being employed across the hall owing to the desire not to restrict the width. The hall measures 79 ft. 6 in. by 33 ft. 3 in. between the piers. The ceiling is of rebated jointed boarding, painted and distempered, with a stencil pattern on the cornice and ribs in grey and black.

ROOF OF ASSEMBLY HALL, FRIENDS' ADULT SCHOOL, LUTON. GEOFFRY LUCAS, A.R.I.B.A., ARCHITECT.

THE ATELIER VERSUS THE BUILDER'S YARD.

In this paper, read by Mr. Theodore Fyfe, F.R.I.B.A., on January 23rd, before the Architectural Association, the author argues that while there can be no real building without precise and intimate knowledge, there can be no great building without a wide knowledge of tradition and example.

THE author referred to a paper entitled "A Review of the Tendencies of the Modern School of Architecture," read before the Institute by Professor Pite in 1900, and to the very recent paper, "Architecture or Building," read at Birmingham by Mr. Schultz. Mr. Schultz, referring to day-school training, said:—

"I must say quite frankly that, in my opinion, the theoretic training is not going to make for good building; in fact, to be quite candid, I am not hopeful that a good general type of modern building will be seen until all we architects are abolished, swept away, root and branch." And then he goes on to say that the craftsmen could, and should, be taught to do the architect's work in addition to, or as part of, his own. Further, he says, "Meanwhile, I would plead for a practical basis in the training of your youths. Send them first to do work and see work done, and to learn and know about the nature of materials, and their putting together; teach them architecture as engineers are taught. Don't bother too much about design."

Abolishing the Architect.

The first part of this quotation is quite too big a subject to discuss here. I would only say, What about the interregnum if architects are to be swept away? And, supposing that could be bridged, should we not find that our great modern buildings would, of necessity, fall into the hands of engineers, with craftsmen to work for them merely as superior decorators? I say "of necessity," because it is surely inconceivable that craftsmen could be entrusted to take up the problems of design, in its larger sense, involved in our great modern buildings. They might contrive fine bits here and there, even whole departments of a large building, which, when one thinks of it, is perceptible in a lot of old work; but one could surely get no great building, fine throughout, on such principles?

Revival of the Crafts.

Now let us turn to Professor Pite's paper. He discusses precisely the same question, a possible revival of the crafts for all practical building needs; but he finds no solution therein. He admits that the minor or "decorative" building crafts are already on a sound footing, thanks to William Morris chiefly. "But" (here I quote him) "the major crafts of building construction are still outside the pale of their decorative sisters, and, indeed, are dependent on the master-architect's training, and upon his paper and pencil, for their usefulness or their beauty. We observe the signs of re-vivification in subsidiary cases; are there not prospects and hopes for the greater ones?" He sorrowfully admits not, and says later, in words which I would have you specially note:—"The architect, whether he wills it or would have it otherwise, is compelled back upon himself, and upon his own intuition and experience, for all discernment and expression of the material and its craftsmanship. The architect at the present day is indeed the designer and master-craftsman. He goes backward to the status of the actual workman to bring his work forward to the point of true architecture."

National Style and International Experience.

I think we will all agree there can be no real building without precise and intimate knowledge, and I would further submit there can be no great building, that we call architecture, without a wide knowledge of tradition and example. The big man is not confused and crowded out in knowing all he can that assists his work, and in seeing all he can that has been done elsewhere. We can have no great national style without first having international experience. The only true receptivity is that of the large, healthy, creative mind. Recognising this, one feels it impossible to tie oneself down to either an atelier or a builder's yard. In the Paris Opera House, certainly one of the greatest buildings of modern times, we see the perfect flower of the system that produced great Prix de Rome men; we see a modern academic design, a design founded on the approved training of the schools in France; but we see much more than this, nothing less than a great building that any builder, properly so-called, who loves his craft, would joyfully participate in; and we see a thing beautiful as an organic whole, within and without, the marvellous creation of a truly great architect. The academic and the practical must co-operate to produce such a building as this.

"We have lost tradition."

In any consideration of this subject, one is bound to come full tilt against old work. Its claims are always sufficiently in evidence, and need no apology. It is right thinking about it in the mind of the student that is essential. On the one hand, he must recognise that we have lost tradition in the sense that the great mediæval builders had it. Nothing could have produced such great works as the west front of Rheims except a religion that was child-like in its trust and firm faith—we dare not believe anything else—and an instinctive hold on tradition. Perhaps it is because we have lost both, in the sense of the earlier builders, that we are utterly unable to clearly comprehend how their greatest works were raised, and flounder about between the one-man theory and the theory of the many workers, more or less inspired. We know that we find it supremely difficult, if not impossible, to do similar work that has the same extraordinary homogeneity and singleness of tone. So the student should realise what tradition means and his own relationship to it. On the other hand, he must recognise that the needs of his time demand of him a training in the most frankly intelligent criticism of the whole modern outlook, a criticism which leads to the appreciation of what he has been trained to regard as the best. He must realise that his achievement is a thing of thought based on a principle of selection as thorough as it is ruthless; thorough, because he must have principles, the more the better; ruthless, because there is a mass of undesirable opinion hanging about the whole game, something which clouds the issue, losing many a man in shallows, uncertainties, and weak work.

The True Liberalism of Art.

To say about a method of doing something, "This won't be satisfactory, it was done at So-and-so, and was bad," may

sound pedantic, but it is in the right spirit. This is the true liberalism of art, which can advance, not because it despises, but because it fears and knows; not contempt, but knowledge, its what we want.

The mass of undesirable opinion before referred to hangs particularly about the subject of old work. Those who make a fetish of it, because it is old work, are largely responsible for this. Setting one's face against such an attitude does not necessarily mean that the student is a foolish iconoclast. It is only ignorance that is abusive.

The Atelier System.

But, you will ask, what is the training that will enable the student to appreciate only the best, and of what does the best consist? Now, here, I think, is the value of the atelier; for it is only, it seems to me, by some such system as the atelier that we are able to find an answer to this most important question. It is through lack of real, systematic, profitable training in design that most of the educational systems in this country suffer—not so much in design perhaps, as in principles that govern design. An architect, I submit, must most emphatically be trained in certain aspects of the theory of his art, just as certainly as the musician. The two arts run parallel, and are very similar in this respect. The gain to the student is immense when one is able to point out the world that lies before him if he is able to recognise that certain proportions and rules—which are at least as old as the Greeks—are discoverable in all great buildings.

To the free and elastic mind this will not become a fetish; far from it; it will recognise the limitations of all rules; but, on the other hand, it will gain immensely in stimulus by adding bit by bit, and will advance thus by real experience. The old weapon, having served its day, will form part of the armoury if it is sound, and be thrown away if it is bad, and a newer and better one will take its place. Here, again, ought to be progress.

The Builder's Yard.

The study of structure is something which appears to be more intensely modern than any other aspect of the question; but is it so very modern, after all? Here is our "builder's yard," but much more. On the one hand, it is all that old work can teach us, as material evidenced in architecture; and, on the other, it is the engineer's table, the plumber's shop, the mason's yard, the multitudinous crafts that appear in a really great building. It is just this about the Paris Opera House that fascinates. This is the ideal, but how seldom achieved! And now, when I speak about the "builder's yard," it is perhaps hardly necessary to explain that I mean by it the extreme that it represents—the view that the young architect must learn to handle tools himself before he can build aright; that he must be a plumber, or mason, or carpenter, and, if possible, all of them, in some measure, if he is to have that intimate knowledge of material that alone produces good work. Here I will state my own position. I recognise that the architect needs this intimate knowledge, this subtlety of appreciation in material; the knowledge that can enable one man to build a beautiful gable in brick while another, with exactly the same bricks and exactly even the same form of gable, produces something which is quite ordinary. But where I demur is in believing that architecture is only this, and that there is not another, and larger, side. To do the exponents of the "builder's yard" justice,

it is only the narrower among them who really believe the contrary, or act as if they did. It is this pernicious hatred of the Renaissance, and of all that people are pleased to call sham building (which in some form or other is as old as any building that ever was), this one-legged theory that the column and the order are a damned thing, that is responsible for half the mischief. All building is surely part of one great craft, the greatest constructive craft there is, whether it be evidenced in a Surrey cottage or in Westminster Cathedral; the one is but the other in little. Thought, care, selection, and trained experience are requisite for both, though the relationship of parts to the whole is somewhat different in each. It is at this point that we appreciate the fascination of Professor Lethaby's remark, quoted in Mr. Schultz's paper, already mentioned, "Design," he says, "is merely contrivance, the doing of work in an ordinary way, just like cooking." On the other hand, has not Professor Lethaby been lately much occupied with the principles that underlie Greek building?

National Style.

But though all architecture, large or small, is one craft, it seems to me we must appreciate that large, formal, ordered buildings demand a more rigid preliminary process in the mind of the architect than smaller work does. We in England have lost a tradition of academic style for large buildings. France has retained such a tradition, or at least built up a modern one of its own; but then in England we have a much surer hold on the whole intent and meaning of smaller work, such as domestic and church buildings. Our best work in these directions is not imitative; it is really part of the national life. To design such work there is much to be said for the "cooking" process: but though ordinary *contrivance*, ingenuity, common sense, are the basis of all design, whether in large things or small, for the great buildings of modern times—our lecture theatres, town halls, art galleries, museums, libraries, flats, railway stations, important commercial buildings—all buildings that can be called monumental, we need, it seems to me, a basic principle, or principles, in our design, and the simplest way I can state it is this: In what way do we relate our processes of thought and draughtsmanship to the actual structure in the execution of large, ordered work? Now, if I may state my own answer, here we want the "atelier," but we want more; for the atelier, in these remarks, is only a symbol of modified, not comprehensive power. Nevertheless, we do want the root-principle of it, to my mind, and that alone which can make draughtsmanship the means that it ought to be. We want to begin with our subject at its beginning, to work from small to large, to visualise our subject as a whole, on paper, and to keep scale, proportion, mass, harmony, before us all the time. We want to work this out to its utmost possible achievement on paper before we touch anything to larger scale; and so pass on from this, and by means of this, to larger and yet larger, till we reach the "full-size," making innumerable studies—line perspectives, isometrics, diagrams—by the way. Now, this, it seems to me, is the true principle and meaning of draughtsmanship in monumental work, and the most certain process for securing good architecture. And the "more" that I have mentioned, what is it? Simply all that

we have in our life—the utmost extent to which our character can inform our work. We all know how, after seeing a great picture exhibition, entering some rooms simply irritates us, and entering others pleases and rests. That is just illustrative of character in work, the power that can be gained by one man "thinking back," as Professor Pite says, so that he can truly bring forward.

The multitude of practical details must be studied thoroughly and criticised with that larger view which is only possible to the impartial mind. Such study will become easier as time goes on, and it can be achieved without the drastic method of apprenticing oneself to a mason. Nay, can it even be properly achieved at all by such a method? That, of course, depends upon the man, but should it be necessary to make it a main plank in our platform?

Let us take these great buildings of the past at random, but representative of great periods in building; say, the Parthenon at Athens, Sancta Sophia at Constantinople, and the Farnese Palace at Rome. The two first of these, thanks to the immense value of a traditional style, might have been *contrived* in the sense meant by Professor Lethaby, though each of them is associated with a great master-builder.

Noble Buildings.

The Farnese Palace could assuredly not have been so contrived. Begun by Sangallo, it was seized by the giant hand of Michelangelo and reshaped to his embodying. I do not ask you to argue whether or not it has the same intrinsic purity of style that the other examples I have quoted possess. I simply ask you if it is not a noble building? And, since then, has any great building been erected in Europe without one informing mind behind it? This is a lesson that history teaches us, and that we cannot surely ignore. Since then the times have become more and more complex. The days move with breathless haste. Can we afford, as architects, to lose our grasp on the bigger sway? I would not argue for a moment that we should not throw our students as much into the builder's yard as possible. With that part of Mr. Schultz's paper I am entirely in agreement. But does all history, all experience, teach us that harking back to something which has its roots buried in the beginnings of things will be to our advantage? We may bemoan our lack of the sheer wonder in creative building attained by some of the older men, but the remedy must surely be with ourselves, and not with others. There are those among us who are always bemoaning the lack of architectural intelligence in the public. To such I would say, "Don't think so much about other people's shortcomings; think more about your own." The public appreciation of architecture is exactly what we architects care to make it. We, and we alone, have to be chiefly responsible for showing the public—whose needs are in the main intelligible, reasonable, and in the majority of cases, absolutely practical—that the best building it can get is the most artistic building, because it is the fittest for its purpose. I believe this can be done if the architect will but put his shoulder to the wheel.

DISCUSSION.

Mr. Curtis Green said that it was more than probable that clear thinking will evolve in the near future a system of education that will make some of us regret our own lack of opportunity. But in the

end it is the men that matter more than the system; we need the system to raise the whole general average of building throughout the country on to a higher plane; even then it is the full man in whom the root of the matter is planted, who will, whatever his initial mistakes and failures, express in architectural terms the virtue of his time. All of us will be agreed that many of our failures could be avoided by more prolonged training; we are in too much hurry to run into active practice either for financial reasons, or because we are afraid that our friends will not wait for us. Should this additional training be in the atelier or in the builder's yard? In practice the architect must have experienced something of both. So far as the two represented two different schools of thought, he was on the side of the builder's yard. The two schools might, he thought, be fairly described as the *real* and the *ideal*; the real standing for the workshop, and the ideal for the studio. He believed that at the present, and for some time to come, our art could be best served from the humbler side. The *realist* argues from nature upwards; starting from reality and never losing sight of it. The idealist argues from an idea already formed; starting from a conception, he argues downwards, rejecting realities where they do not fit in to his preconceived scheme. The *idealist* has the more lofty pretensions. Half of the charm of the historic architecture of this country lies in the materials used and in the skill with which they were laid down. He believed that the weakness of modern English architecture lay with the producer rather than with the designer. The British working man is the stumbling-block in the path of our best architects. Through no fault of his own, his natural taste for sound craftsmanship has been perverted. He has had set before him the false standard of excellence created by machine labour applied to illegitimate ends. He has learned his lesson thoroughly. The subdivisions of his one-time craft evolved in factories and by trade unions have destroyed both the self-respect and the pleasure which he once derived from his craft. To those who believe that the standard of craftsmanship is connected with the well-being of architecture, the detached and superior attitude of the atelier will hold little hope of the future. Can the conditions in which our work is carried out be studied in the atelier? Can we influence or direct the man who crystallises our idea until we learn what he has to teach us about the genesis of that idea? Can we design rightly in materials the properties of which we do not understand and cannot learn from books? The whole question of the right and the wrong use of mechanical labour is for us to pronounce on; where can we learn about it but in the builder's yard? If during our student days we are trained to deal with the real things first, not standing aloof from the facts of life, we may come to express in concrete form the ideal to our fellow-men.

Mr. Arthur Keen said he thought that Mr. Fyfe had at the back of his mind the idea that the A.A. method of tuition was the ideal.

Mr. W. H. Ward (of Theobalds Road) said they all seemed to agree that tradition was necessary, and the only way to get into touch with tradition was by some atelier training. Trades in the building industry were so involved that it was impossible to go through them all; but a

Economy of outlay having been an important consideration, the design of this church is necessarily simple in character: the effect of the interior, nevertheless, is by no means bare, and a feeling of dignity is given by the aisles, which are unusually lofty. The walls of the aisles and the morning chapel are panelled to a height of 12 ft. and distempered an olive-green colour above. Seating accommodation is provided for 800 worshippers. The total cost of the church was £9,000. Messrs. T. H. Kinglerlee and Sons, of Oxford, were the builders.

CHURCH OF ST. PAUL, WEST EALING, LONDON. HALL-JONES AND CUMMINGS, ARCHITECTS.]

little of masonry and carpentry would prove useful. The villas of France were, on the whole, ghastly failures. They either attempted to be grand monuments on a small scale, or drifted into some awful form of new art.

Mr. Seth-Smith observed that it was of enormous importance in a school like the A.A. to convince the pupils that principles had been thrashed out. If not, he failed to see with what confidence a student could enter the schools. He differed from Mr. Green as to lofty ideals being questionable. The greater the ideal the greater the achievement. The purely academic course of instruction was expressed in the Ecole des Beaux Arts; and the smaller architecture of France was not worth looking at in consequence of this training. English domestic work was generally acknowledged to be really beautiful; but it was advisable to supplement instruction in the smaller work by something of a more monumental kind. Referring to the Opera House, Paris, the speaker remarked that he knew an Englishman who was present at its erection, and who told him that the building was a whole tissue of falsehoods. If a student had a year to spend, continued Mr. Seth-Smith, he could not do better than utilise it in a workshop experience. He had read how Sir Gilbert Scott, lacking this practical experience, proved a veritable bugbear to the workmen, who welcomed his departure from the scaffold. During the course of his remarks, the speaker alluded gracefully to Mr. H. H. Statham's paper, delivered at the previous meeting.

Sir Brumwell Thomas said there was very considerable agreement in favour of academic training in France. There was the Charles Garnier style on the one hand, and on the other work of a domestic character, which was not so satisfactory as the former. In England the reverse was the case. There were indications, however, of a coming spirit in French domestic work. Sir Brumwell then described a delightful villa he had unexpectedly encountered in France—one that was quite a refreshing departure from the usual style of house. But, they would enquire, who was the architect? Monsieur John Belcher, of London. The French student was subjected to the most exhaustive tests in every respect. The first two years of his

training were taken up in developing the artistic qualities; the second two were highly scientific, and quite in advance of anything in England; and a further eighteen months were occupied in cultivation of the grand manner. Concluding, the speaker said he was strongly of the opinion that academic training in England must come to pass.

Mr. Louis Jacob said they all knew that the architect who would take hold of the tools and show how the work should be done was a terror in the hearts of all builders. Architects of this kind invariably produced sound building, but he had never been struck by the artistic quality of the work.

Mr. G. Drysdale suggested that the fact of our being English accounted for our lack of appreciation for French domestic work. Architects, he thought, would benefit by a little more reason and a little less taste.

Mr. Walter Millard advocated the combination of the best points of the atelier and the builder's yard. As to the mastering of all trades, if this was a serious proposition it logically meant mastering all tools as well.

Mr. H. P. G. Maule said that the title of the paper was misleading. Mr. Fyfe did not mean the atelier or the builder's yard. It was essential that training should be both academical and practical. The architect should be able to direct and control; but he was not a craftsman. Concluding, Mr. Maule emphasised the necessity for simplicity in the initial stages of a student's tuition, and the importance of gradually approaching ideals from the more humble and practical side.

Mr. D. A. Foster and Mr. Cart de Lafontaine having made a few observations,

Mr. Gerald Horsley recalled that this same subject was greatly agitated about twenty years ago, and referred to several of his contemporaries who had started as architect-builders, but who had not had a very wide range of work. Speaking of the scheme of the Board of Education, Mr. Horsley said that this dealt only with four years of the student's training, and made no provision for what was to come after. He hoped that the new Board would repair the omission.

Mr. Allan Potter said that we were in very much the same position as the mediævalists. As the Gothic arch was to

the Classic lintel, so was the steel girder to the Gothic arch.

Mr. Arthur Keen decided that no vote should be taken. Mr. Green's instance of the brick wall seemed to him to be a point in favour of educating the bricklayer rather than for the training of the architect. The architect had well-defined functions. He had to deal satisfactorily with the various professional problems that arose; and it was practically impossible for him to proceed in his work except by designs on paper. To expect him to work in the open was out of the question.

Mr. Fyfe replied briefly, observing that they had necessarily to be practical men: he had particularly emphasised this in his paper. The Opera House was said to be a sham building. He raised no objection to this so long as it was a fine building. With regard to the title of his paper, he had employed the term "atelier" purely as a symbol around which to arrange his matter.

FEDERATION NEWS.

Leicester.

The annual dinner of the Leicester and District Building Trades Employers' Association was held at the Grand Hotel, on January 26th, Mr. F. Beck presiding.

The President proposed "The National Federation," remarking that it was the one body in the country which tried to unite employers in the building trade with the view of protecting their own interests, and bringing about harmony among employers and employees. The council of the Federation had done yeoman service for the trade, and he hoped it would continue to grow in strength and importance.

Mr. James Wright (senior vice-president of the Federation), Nottingham, replied, outlining the work and objects of the Federation.

Mr. A. Chambers submitted "The Leicester and Leicestershire Society of Architects."

Mr. W. M. Cowdell, F.R.I.B.A. (President of the Leicester Society of Architects), and Mr. Clement Stretton, A.R.I.B.A., replied.

Mr. G. A. Hewitt proposed "The Midland Centre," and Mr. W. Yates (vice-president), replied.

Bath.

The annual meeting of the Bath Association was held on Saturday, January 14th, Mr. George Hayward in the chair.

A discussion arose as to the advisability of altering one of the working rules; but after an expression of the opinion of those present, it was decided to make no alteration.

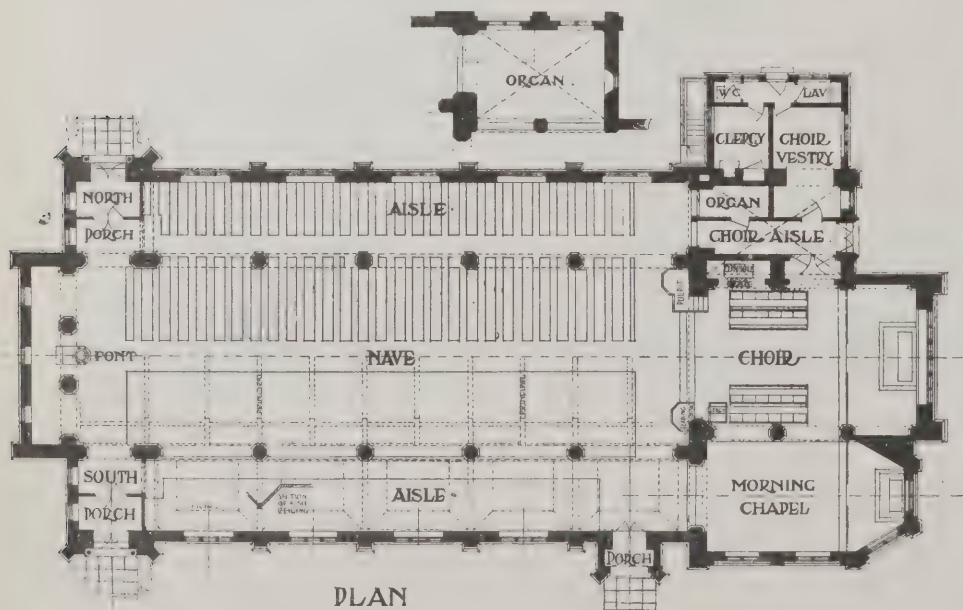

The secretary then read his annual report, in which he congratulated the members on the completion of twenty-one years of the association's existence since its reorganisation in 1890. The past year has been uneventful; but trade, on the whole, has shown a slight improvement on the previous year. The only question with regard to labour that arose during the year under notice was that with regard to an application by the painters for an increase from 6½d. to 7d. per hour, as to which it was decided that the state of trade did not warrant any concession. During the year eight general meetings (of which four were special), and ten committee meetings, have been held, and increased interest in them has been noted. Two firms have ceased to be members, and five new members have been elected. One honorary member has resigned, and one has been elected; and the association now comprises 36 firms; with 42 members in the active list, and 20 firms as honorary members.

On the motion of Mr. C. H. Long, seconded by Mr. F. J. Blackmore, the secretary was accorded the best thanks of the association for his able and exhaustive report.

The Hon. Treasurer presented his accounts as audited for the past year, showing a very small but satisfactory increase of the balance in hand on the previous year.

Mr. Stephen Ambrose (who had previously filled the office in 1894-95) was unanimously elected president for the ensuing year, and Mr. Walter Allan Sheppard vice-president. Mr. Councillor Sydenham consented to perform the duties of hon. treasurer for the 11th year in succession. Mr. Edward J. B. Mercer was elected secretary for the 22nd time. The following members, after a ballot, were elected to serve as a committee, viz., Messrs. H. H. Knight, W. Morris, F. C. Chancellor, and F. J. Blackmore. Messrs. C. C. Wills and E. Ireland were elected auditors, and a vote of thanks was accorded the retiring auditors, Messrs. Wills and Amery. The retiring members (viz., Messrs. Ambrose, Blackmore, Hayward, Erwood, and Ireland) were re-elected to serve on the executive committee of the South Western Federation.

It was agreed the annual dinner should be held in the second week of February.—EDWARD J. B. MERCER, Secretary.

The St. Paul's Bridge Scheme.

HE date is near, we believe, when the Corporation will apply for their Bill for the proposed St. Paul's Bridge. That the application will be opposed, in one way or another, there seems no doubt; but it will be as well to make clear why the Bill ought to be opposed by all those who have any interest in the architectural improvement of London, as the chief city of the Empire.

There has been a great movement of late in regard to the architectural importance of town planning; the necessity for considering vistas and the alignment of streets with relation to open spaces and public buildings. But so far as the Corporation of London are concerned it would seem that all this has been entirely thrown away, and might as well never have existed, if we are to judge by the nature of their proposals for the new bridge, and the important road on the south side of the Thames which is to lead up to it. Their proposed line of road is shown by the continuous lines on the drawing reproduced on the next page. Here is proposed a road laid out on no consideration but that of economy and supposed convenience for traffic; a road promising no vista and no architectural effect of any kind. The scheme includes a great new bridge over the Thames; but no design of the bridge has been published, nor included in the application; the plans showing nothing but a very commonplace roadway scheme. That the Corporation can obtain any Bill without even letting it be known what kind of bridge they propose to build, or exhibiting any design for it, seems preposterous; at least it would appear so if, unfortunately, we did not know how careless is the Parliament of this country where architectural questions are concerned.

But what is still more reprehensible is the attitude which the Corporation, as represented by the Bridge House Estates Committee, have thought proper to assume in regard to the scheme. They appear plainly to assume that because they find the money they have a right to do what they like, and that any outside opinion on the subject is an intrusion. Do they really suppose that London is their property, and that they have the right to play with the architectural improvement or disfigurement of London, in a scheme in which future generations are also concerned, just as they please at the moment? If so, it is time that they should be told the contrary in the plainest manner. A man may do what he likes in his own park, no doubt, but not with the public architecture of a capital; and the funds which the Corporation have to expend on such a work as this they morally, if not legally, only hold in trust for the public good. They have no kind of right to say, "because we find the money we can do as we please"; or to treat the suggestions and advice of the Royal Institute of British Architects with something like impertinent resentment, as they undoubtedly did.

The Institute has at heart the architectural beautifying of London, a subject which they understand, and which the Corporation authorities apparently neither understand nor care about.

From the moment when there was talk of the new bridge it was apparent to everyone with a sense of the architectural fitness of things that here was a grand opportunity for opening out St. Paul's, and making a stately and impressive approach to it on the southern side. What does the proposed line of road do? Simply treats St. Paul's as an obstacle to the roadway, to be got round. We do not believe there is any other capital in Europe where anyone would venture even to propose such a scheme. In Paris, we are certain, anyone who proposed to lay out a new street leading up to the vicinity of a great building without any consideration whatever of so making it as to be axial with the building, would be laughed at. On the drawing reproduced on the next page we have shown, in heavy dotted line, the route which such a road should take, so as to produce the finest effect. It must be observed that the crook at the southern end of the official plan is only due to adopting at that point the line of an existing street, which would in any case have to be pulled

A SCHEME FOR THE ST. PAUL'S BRIDGE.

The thin continuous line shows the route proposed in the Corporation Bill; the heavy dotted line indicates another, and a better, route.

THE ST. PAUL'S BRIDGE.

down in order to be widened as part of the new road; it is not at present of the width shown on the plan; so that there is little even of economy there. The new street and bridge should lead straight up to St. Paul's dome, which would form the central object at the end of the vista, the street ending in a wide semicircular *place* opposite the south side of the cathedral. We are quite aware that it would be costly, but in so great an opportunity for a grand effect cost ought not to be counted; and it would even be fitting that Government should, if necessary, supply part of the funds, as the French Government would almost certainly do in a similar case; a great improvement in the capital city being a matter of national, and not merely of local importance.

In the drawing on the preceding page we suggest a still larger, and what would be a really magnificent, scheme. At the west end of the Borough, at A, there is a circular open space. Form a similar circular *place* at B, at the eastern end of that straight line of street, and from that run the new road up to the bridge and to St. Paul's, not as a mere street, but as boulevard a mile long, with trees on each side. It would be one of the grandest improvements ever carried out in London, and it would have this specially beneficial result, that it would form the first inroad of beauty, as one may say, into a district of London which is at present peculiarly devoid of charm—a desert of more or less sordid-looking streets and ugly and uninteresting buildings. It would raise not only the enjoyment of life, but the value of property over a great portion of South London, and would be a blessing to many future generations.

Both schemes present one slight objection, which we will anticipate; that the bridge would not be quite at right angles to the course of the river at that point. But the objection is less than may appear at first sight. On the plan we propose, the situation would be dominated by St. Paul's Cathedral, a fact which would quite explain the line of the bridge and reduce it to a secondary consideration; and if properly treated architecturally no ill effect would be produced, as the variation from a right angle with the river bank is not very great, nor would it be very noticeable in execution.

There is, in addition to the architectural question, a practical objection to be considered with reference to the Corporation scheme, which is emphasised in a letter, signed by several eminent architects, that appeared last week in the *Times*, the signatories including Mr. Belcher, Mr. Ernest George, Sir Oliver Lodge, and Mr. J. W. Szlumper, a member of the Institution of Civil Engineers. After remarking that questions connected with a new bridge over the Thames are not only of metropolitan but of national interest, they proceed to comment on the probability that subways for tramways, though not actually mentioned, will form part of the scheme, and they would therefore impress upon the public the necessity of insisting upon a guarantee from the authorities that, if this bridge scheme is carried out, the tramways connected with the scheme "must not pass through a subway so near to St. Paul's Cathedral as to be a very serious menace to the structure." Knowing what we do about the nature of the foundations of St. Paul's, we know that this is a very serious danger, and that every precaution should be taken to guard against it.

But our chief desire, that one of the finest opportunities for a grand architectural improvement that London has ever had, should not be thrown away through ignorance, indifference, and false economy.

Completing the New Government Offices.

PREPARATIONS are now being made for the commencement of the final block of Government buildings on what is popularly known as the Great George Street site, and before long the work of excavating the foundations will be taken in hand. Altogether the work is expected to occupy six years. The

corner block of offices facing St. James's Park is to be allocated to the department of the First Commissioner of Works, who is at present at Storey's Gate, having removed to that position some years ago from Whitehall Place. There is now only one private house remaining on this side of Great George Street—No. 27—which at the moment is occupied by the Companies Department of the Board of Trade, but this, together with the premises of the Institution of Civil Engineers, which were erected only a few years ago, will shortly be demolished, the latter body having new buildings in course of erection on the opposite side of the thoroughfare. The new block will then join up with the Local Government Board, and an opportunity will be afforded of completing Brydon's circular court. Another improvement in the same neighbourhood, which will also be effected before long, is an alteration in the position of the historic Storey's Gate, at the bottom of Great George Street, which takes its name from Master Edward Storey, who was the keeper of the King's Birds in the time of the second Charles.

Builders' Business Methods.

THE periodical returns of bankruptcies in the United Kingdom invariably show builders at the head of the list. Naturally enough, builders are by no means proud of that bad eminence. They protest that, as a body, they do not deserve it. Their invincible position at the head of the poll sets up a very damaging impression, and a really unfounded prejudice against an honourable industry. But this being so, how does it come about? The explanation is simple. The industry offers peculiar temptations to the adventurer—to the workman who, with scant capital, or none at all, essays to join the ranks of master builders, and immediately defies the saying that "no man buildeth a house without first sitting down and considering the cost thereof." He usually goes right ahead without troubling to make any calculations at all; but his subsequent ruin is not much more complete than that of the bona-fide builder, who, while employing a certain amount of capital, "never quite knows how he stands," because he knows nothing, and often pretends to care less, about the details of book-keeping and the accountancy side of his business. Consequently he is constantly working in the dark, and blindly trusting to luck that he will come out on the right side of the contract, or at any rate not so very far on the wrong side. It is such men as these who swell the bankruptcy lists, and bring undeserved discredit on the entire trade. They are responsible, moreover for other evils that are even more tangible. In their reckless disregard for the rudimentary principles of business, they tender upon imperfectly ascertained or wantonly diminished data, and snatching the job from more prudent and businesslike tradesmen, realise a loss on it, perhaps in spite of frantic economies (to say nothing of scamping)—which, again most undeservedly, tend to bring the industry as a whole into disrepute—and finally find themselves in the hands of the official receiver. Bad business methods (not necessarily including bad faith, although the two evils seem to have a sort of mutual affinity) lead, in fact, to all kinds of rottenness, and this, in effect, is the chief reason why builders habitually head the bankruptcy list; although, at the same time, it should not be forgotten that, the figures being absolute, and not proportional, and building being the largest synthetic industry in the kingdom, the large total of bankruptcies is perhaps not much more than commensurate with the large total of practitioners. The failures would be far fewer, however, but for the undue prevalence of such conditions as those to which we have ventured to draw attention; and the substantial and reputable firms who conduct their business on sound commercial principles, and with irreproachable probity, would be spared the annoyance arising from an utterly unjust general aspersion upon their calling by a public that is not good at discrimination.

The Decision as to St. George's Hall.

THE Finance Committee of the Liverpool Corporation again discussed, on February 11th, the request of the King Edward Memorial Committee that the Corporation should provide a site by the St. George's Hall for an equestrian statue to King Edward. Mr. Norman Shaw's design, showing a double stairway approach to the south portico, in place of the present unbroken podium wall, was again before the Committee. By a majority of nine to four the Committee decided to approve of the proposal to cut into the wall, subject to a modification of the details to be discussed later. The proposed position of the statue, however, did not find favour, and ultimately the Committee resolved to recommend to the Memorial Committee a variation of the scheme. They agreed unanimously to reserve spaces for statues at either end of the podium wall in St. John's Lane, and asked the Memorial Committee to put the King Edward statue on the site nearest to Lime Street. It is understood that the Memorial Committee will accept this solution. The Lord Mayor, who is chairman of the Memorial Committee, was present at the Finance Committee's meeting, with Mr. Goscombe John, the sculptor. The new plan meets certain objections to the placing of a high statue directly in front of the columns of the south portico, but not the views of those who oppose any interference at all with the simplicity of the podium. We suggest that further competent advice should be taken upon the whole question before the irrevocable last word is spoken.

The Mall Difficulty Settled.

THE difficulty of the Mall has been settled on the following lines: The London County Council will carry out the undertaking, the cost of which, under the new modified plans, will be considerably less than was anticipated. The Government contributes the site of two houses, which have already been cleared, but the County Council has to buy and pull down two more properties on the opposite side of the road to Drummond's Bank. Negotiations are at present in progress for these. The width of the new road will be 75ft. The whole scheme is already practically put in hand, and will be carried out well before the Coronation, probably by May at the very latest. The Government thus contributes no money at all, but site values; the Westminster County Council gives £30,000, and the London County Council finds the balance. This may not be much more than £50,000. This settlement, however, can only be regarded as temporary and tentative. It will serve to meet the immediate requirements with respect to the Coronation procession; but the question of dealing satisfactorily with the whole area, including Trafalgar Square, will remain open until the authorities acquire sufficient courage and funds to take the more heroic course of materialising a grand opportunity in the grand manner.

Royal Institution Lectures.

ON Saturday last, Mr. T. G. Jackson, R.A., gave the first of a series of three afternoon lectures on "Byzantine and Romanesque Architecture," in the lecture theatre of the Royal Institution. The first lecture dealt more especially with Byzantine architecture. Describing Roman architecture as the parent both of Byzantine and Romanesque, he claimed that it had been unduly depreciated by modern writers, and that the Romans, though far inferior to the Greeks in artistic feeling, had immensely enlarged the scope and possibilities of architecture by their free use of the arch, which adapted the art to the new conditions of life under the Empire. He then described the effect upon architecture of the coming of Christianity into favour—the nature of the early churches founded on the Basilica plan, and the alteration which the Classic capital underwent both in the style of its detail and the addition of the *dosseret*. Mr. Jackson regards the *dosseret* as introduced in order to provide a wider base for the spring of the arches; we think an additional

reason may have been to make allowance for the varying heights of columns which were mostly the spoils from Classic buildings. Mr. Jackson next went on to consider the subject of the dome; the difference between the Roman and Byzantine construction being described, and the theory of the pendente explained by diagrams. The lecturer proceeded to describe the transformation of the Latin church plan into the cross plan with a central dome of the Byzantine architects, more especially illustrated in Sta. Sophia. Mr. Jackson showed how the later Mahommedan mosques had all been influenced by Sta. Sophia, though its example had been copied in a much weaker manner, and with a great deal of monotony. In an eloquent summing up he spoke of the strange and remarkable historic interest centring round Sta. Sophia, and all the various scenes which it had witnessed, and left the audience with the impression that Byzantine architecture at its best really meant Sta. Sophia, and that building alone; an opinion in which we entirely concur. The Italian buildings of Byzantine type, at Ravenna and Venice, will come into the next lecture. The lecture was an admirably condensed recapitulation of the main facts of the architectural history, without a superfluous word.

The Old Bridges.

A plea for the preservation of ancient bridges now threatened with destruction was made on Wednesday last before the Society of Antiquaries by Mr. J. Willis Bund, chairman of the Worcestershire County Council, who said one excuse for altering these bridges was that motor traffic was on the increase, and it was necessary to strengthen the structures lest accidents should occur. The question was how could the bridges be preserved. Some of them were historic monuments, and he failed to see why the Royal Commission on Ancient Monuments should not schedule them, for then there would be difficulty in committing any act of vandalism. He had not a great respect for the Office of Works, but it was better than nothing; and he suggested that before any proposed alteration of the old bridges thus scheduled was entered upon, plans should be submitted to that Office. Then, if any county council or other authority did work without permission, the members who voted for the alteration could be surcharged. Sir Henry J. Howarth, who presided, considered that Mr. Bund's proposal would be effective in preserving their picturesque old bridges. He was a member of the Royal Commission on Ancient Monuments, and always thought that its object was not merely to make an inventory of all antiquarian objects, but to take steps wherever they found wilful destruction going on, and so get the Government to do something in the way of preserving them.

Restoration at Wells Deanery.

Dr. Armitage Robinson, whose installation as Dean of Wells is provisionally fixed for February 24th, is having considerable alterations made at the Deanery, the chief of which is the restoration of the ancient dining hall to its original size. This hall has perhaps for two centuries been partitioned into bedrooms and living rooms, and many of its architectural features have been hidden by lath and plaster. During the alterations there have been revealed several oriel windows containing old stained glass, and a fine Tudor fireplace, which had been bricked up. There is, too, a concealed minstrel chamber at the far end of the hall. The hall, like the chambers above it, had windows on the south as well as the north side, but on the filling up of the inner courtyard most of the south windows were blocked up, and this must have detracted greatly from the brightness of the room. It was probably found in the seventeenth century that the hall was not very useful in a domestic house, and to meet the changed conditions of life it was divided up by means of somewhat flimsy partitions into bedrooms. It is these partition walls which Dr. Robinson is having removed.

LIGHTING FOR SMALL COUNTRY HOUSES.

BY CLYDE YOUNG, F.R.I.B.A.

IT is perhaps somewhat presumptuous to attempt to deal with so large a subject in the limited space of a short article, but it appears to the writer that even a condensed résumé of his own experience in connection with the lighting of a small country house might be interesting to his brother architects, and also useful to the layman, who may at some time have to decide the question how best to light his own home when no public supply of gas or electric current is available.

The chief agents one has the choice of using for such lighting are oil lamps, acetylene, petrol, or air gas, and electricity.

To the use of lamps burning paraffin oil there are many objections, such as the imperative need of daily attention, re-filling of each separate unit, with the attendant mess and trouble, the difficulty of getting servants to trim the wicks properly; and even when oil lamps are given the most careful attention they show a tendency to smoke and smell, the best-made lamps being liable to the creeping of paraffin, which covers the outside of the retainer with a thin film of oil. Added to these objections is the ever-present danger of fire when such lamps are used, caused by their being accidentally upset or broken.

Until comparatively recently, the oil lamp has been the only practical means of lighting a moderate-size country house at anything approaching a reasonable cost, but the improvements which have been made in acetylene, air gas, and electric light plants now bring these within the reach of

A good example of modern leadwork.

most people; so that, in making a selection, as long as the lease of the property warrants the necessary capital expenditure of putting in either a gas or electric light plant, the owner is not likely to give oil-lamp lighting his serious consideration.

With acetylene or petrol gas it is more difficult to decide which to use, as the generating plants of both systems are now so simple that any gardener or odd man should be capable of working and looking after them.

Acetylene.

The plant for acetylene gas is rather cheaper than that for air gas, but the cost of producing acetylene gas is higher, light for light, than that of air gas, the former being about 11d. per 1,000 c.p. hours, while air gas costs about 2d. per 1,000 c.p. hours. In both cases pipes of small dimensions are used; and as it is a searching gas, the workmanship throughout must be of the best, and the fittings of superior quality. Copper should on no account be used in any position in which it might come in contact with acetylene gas, as, in the presence of moisture, copper acetylide, a red precipitate, is formed, which is liable to explode when heated or struck.

Acetylene gas is rich in carbon, and this is easily deposited at the tip of the burner, and causes smoking; it is therefore most important that the burner should be kept clean, and that taps and joints should be periodically greased and ground in, otherwise a slight leak will occur, and considerable inconvenience be caused by the unpleasant smell from the escaping gas. The generating plant ought to be in a house by itself, well ventilated, and provision made against freezing of water used in generation. No artificial light should on any account be allowed in the generating house except an incandescent electric lamp—any switch, fuse, or storage battery should be outside.

Explosions (which certainly have been more common abroad than in this country) have frequently been found to have taken place when the pressure of the gas was over two atmospheres.

It may be useful to note that acetylene gas has a far wider range of explosibility than coal gas, the limiting percentages, as determined by Prof. Vivian B. Lewes, being 3.82.

Petrol or Air Gas.

The manufacture of petrol or air gas is now quite as simple as that of acetylene gas. The various systems employed all depend on the generation of a mixture of petrol vapour with air in definite proportions, the air being passed through suitable apparatus and carburetted with the illuminating gas. The main essential quality of all the systems is that the mixture generated should, at the burner, contain a small proportion of petrol vapour mixed with air, and that the composition of the mixture should be automatically controlled, so that it does not vary. The gas so manufactured contains 98 per cent. of air and 2 per cent. of petrol vapour.

The necessary plant is small, and takes up very little room, the floor space required being about 4ft. by 4ft.

The machinery for regulating the supply is worked either from the domestic water supply or by the falling of a weight, and is so regulated that when no gas is being used the machine stops and none is manufactured; but as soon as a burner is turned on, it automatically commences generating gas. The advantage of this gas is that it is cheap, non-explosive, and the odour is not unpleasant, but it is at the same time distinctly perceptible, enabling cases of escape to be easily detected.

It is claimed that, owing to the small amount of petrol vapour mixed with the air, the products of combustion are less poisonous than in the case of ordinary gas, and that it can even be applied to the lighting of greenhouses.

Electric Lighting.

An electric light installation requires greater space for the plant, and is rather more costly than putting in acetylene or petrol air gas; this, together with the fear that electric light means complicated machinery, requiring constant and expert

attention, undoubtedly deters many from adopting it. The simplicity and reliability of the modern oil engine, however, together with the vast improvements made in the manufacture of the metallic filament lamp, with its increased illuminating power and greatly reduced consumption, render this fear groundless. From the experience gained with several small plants of about 70 lights, the writer does not consider there need be any anxiety as to mechanical breakdown, costly renewals, heavy running expenses, and high wages bills. The approximate cost for fuel should average 1s. to 1s. 4d. per lamp per annum, while a complete installation up to 100 lights, comprising small combination set, switch-board, battery, and wiring, can now be obtained for about 65s. per light.

Under these conditions, the question of adopting electric light is an important one, and requires careful consideration, especially when its numerous advantages are taken into account—viz., cleanliness, absence of heat, ease of control, and adaptability for purposes other than lighting, such as vacuum cleaner in house, working churn and separator in dairy, lathe or other tools in workshop, charging hand-lamp accumulators, etc. Lights which are placed at entrance gates and along the drive are also easily arranged, and can be controlled from the house, thus avoiding the necessity of servants having to go out in bad weather to light them. A plant of which the writer has personal experience comprises a 4 h.p. Hornsby Ackroyd oil engine, with belt driven dynamo 30 ampere capacity at 50 volts, with an accumulator of 28 cells—i.e., 25 and 3 spares. This plant has been in continuous use for five years without any breakdown. The battery has been cleaned once, and the plates were found in good condition. The only renewals during that time have been a new vaporizer which cost 30s., and the sole trouble a choked jet, which occurred soon after the plant was installed, and was due to it not having been properly cleaned. The plant is run and looked after by a motor driver who is not by any means a brilliant mechanic, and had no previous knowledge of electricity. Another, and somewhat larger, plant, which gives equally good results, is in charge of a gardener. The important points to be remembered if a good result is to be obtained are first, that a thoroughly good plant be put in and the workmanship throughout be sound and efficient, that ordinary care is taken to carry out the maker's instructions for running the plant; second, the engine and dynamo must be kept perfectly clean and well lubricated; third, the accumulators should not be worked beyond the capacity advised by the manufacturers and never allowed to discharge beyond the minimum given, usually 1185; fourth, if the light is out of use for any length of time, the accumulators must be periodically discharged and charged, or if no light is required for, say, 12 months, it is advisable to discharge and empty the battery, leaving the plates dry.

In many cases where the cost has exceeded the average the writer has found this to be due to the excessive load in the mornings caused by the servants switching on all the lights in a room when cleaning, and not switching them off again when proceeding to another room: in consequence the whole of the lights on the ground floor are frequently found to be on at the same time; to prevent this it is a simple matter to arrange for, say, two lights in each room to be taken to a separate fuse board, supplied by a subsidiary cable, connected to the main cable after entering the house but behind the main switch,

the switches for both the main and subsidiary cables being placed in a locked box, thus enabling the person in charge to control the number of lights available for use in the mornings.

PROF. LETHABY ON GREEK ARCHITECTURE.

At the meeting of the Architectural Association held at No. 18, Tufton Street, Westminster, on Monday, February 6th, Professor W. R. Lethaby read a paper, from which extracts are given below, in which the aim was "to attempt a general survey of the origins and characteristics of Greek architecture."

PROFESSOR LETHABY said at the outset that although he intended to be frankly historical, he nevertheless believed that all these historical studies might be dangerous to those who would actively follow modern architecture, which he conceived of as masterly structure with adequate workmanship. But we have to keep every faculty alive, and we desire not only living architecture, but the most perfect understanding of history.

Continuity.

Having passed in review the results of successive explorations on Greek soil, and having discussed at some length the origins of Greek architecture, Prof. Lethaby said he felt that Greek art is Agean art in a second phase, as being of the same land and in the blood of the people, both by a real continuity and by a revival—a revival, that is, which was a spontaneous borrowing from the past, as Romanesque was a revival of Roman.

Greek Plans.

All architectural planning is developed from the construction of primitive dwelling-huts. Such structures branched off into the tomb and again into the temple—the tomb was the dwelling of the dead, the temple was the dwelling of a god. The dwelling house became complex in adding cell to cell, but the Greek temple remained a glorified hut, a simple cell. Temples hardly appeared outside Egypt before about 1000 B.C.

The circular plan, which attained its final power in that mighty crown, the Pantheon, very probably had a continuous history. Even the basilican form of plan may have a much remoter origin than has been supposed. Thus, Dr. Evans has found at Knossos a hall of the Royal Villa which is described as "a pillared hall about 37 ft. long by 15 ft. wide."

Walls and Masonry.

Early walling was of crude brick or rubble strengthened by beams and posts of wood. Burnt brick is found in Crete. Fine ashlar masonry was built in Crete at least 2,000 years B.C. The inferior walls were covered with plastering. The early type of masonry usually called polygonal was occasionally continued in later times, very accurately executed. The walls of the little temple at Rhamnus were of this kind, and the thick marble slabs of the sixth century temple at Ephesus was quite a crazy patchwork. In fine square ashlar the bedding and jointing became so accurate that the joints could hardly be seen. All such masonry was put together without any cement, but stones were linked together by metal cramps and dowels. Later cramps are of the form of a rolled iron girder; earlier ones resemble the letter Z if it is bent a little so that the turns are at right angles.

Walls were completely dressed down after erection, and the fluting of columns was then done. This was probably a later custom, for the walling stones of the sixth century temple at Ephesus are slightly chamfered all round. Stones were frequently hollowed out at their back so as to reduce their weight. In this way ceiling beams and lacunars were considerably

lightened. A cornice stone from Xanthes in the British Museum is an example. The lacunaria or masonry ceilings were formed of thick slabs, with a series of square coffers dug out of them. In the Museum and other places the squares were pierced right through, and little covering pieces like tiles were set in rebates. At Bassæ the coffers are not square, but in various proportions of lozenges. At Priene and the Mausoleum there was only one big coffer to a columniation, and it was reduced by a series of oversailing margins to a panel of fair size.

Plaster and Painting.

If temples were not built of marble, and comparatively few were, the masonry was covered by a thin coating of very fine plaster rubbed down to a smooth face to take the painting and gilding. Plastered temples were fully coloured with washes and ornamentation. Marble temples were part coloured and picked out, illuminated as it were. The triglyphs were usually a bright blue, also the cornice blocks above; the spaces between the latter and the bands were full red; lacunaria were usually blue, with a gold star, and so on. The margins and mouldings had delicate little frets and honeysuckle patterns. Even the figure sculpture was heightened with gilt bronze and painting.

Mouldings.

Greek mouldings were very few. There is the ovolo or echinus of the capital, and a similar roll or cushion which seems to be an essential part of a base. The Egyptian cavetto is found in terra-cotta roof-casings of an early date. The most curious moulding when seen unadorned is the hawk's beak, but it was always painted into a series of petals: the beak part is formed by the turned-over tips of the petals. The carved egg and tongue moulding had its origin in the same idea, it represents a series of petals turned out and down. Then there is the elegant Lesbian leaf moulding, always painted or carved with a row of leaves, and finally the cyma recta, a moulding first used for the gutter of the Propylæa.

Casings.

Besides the main line of development into the mature marble architecture of the fifth and fourth centuries, there must have been several collateral traditions arising out of wood and crude brick construction. At Sparta there was a shrine plated over with bronze plates, doubtless on a wooden framework. Mud bricks continued in use all the time, and are still used in the East. Even in the days of Vitruvius, brick meant sun-dried clay, although burnt brick had been used in Egypt and Crete, and roofing tiles had been fired from an early period. This use of a material not impervious to rain seems to have led to the sheltering of the side walls by spreading the roof on to an external colonnade, originally a row of wooden posts. The walls were also plastered. A further step with this type of building was to extend the use of casings like the burnt tiles of the roof. The early temple of Thermon had its metopes of painted squares of tiles; and painted tile casings for the cornices and pediments

had an enormous vogue in Greece, Sicily, and Italy. I may remark here in regard to Italy that the tile-cased type of building found there and usually called Etruscan is only a distant wave of the Greek impulse. A very fine example may be seen in the terra-cotta gallery in the British Museum, of casings which were evidently nailed over timbers. The use of these terra-cottas covered with elaborate painted patterns was later taken over into stone architecture, and remnants of them have been found on many sites.

Stairs, Windows and Doors.

In the Palace at Knossos there is a staircase rising in five returning flights. At Silenus the temple has a spiral turret stair. Careful drainage works were executed at Knossos with socketed pipes, and excellent inspection traps of the fourth century have been found at Priene. Ample evidence for large windows divided by mullions has been found in Crete. There are windows of the fifth century in the Propylæa at Athens, and some delicately ornamented fragments of window architraves from the Erechtheum are in the British Museum.

Pillars, Cornices, and Caryatides.

The Greeks restricted themselves in the main to two types of columns, but there was much freedom in the use of them. In the Propylæa built in the fifth century, directly after the Parthenon, both kinds were used. There was something of the sacred and of personality in pillars, and there may be a half-memory in the notion of Vitruvius that the Doric was male and the Ionic female. Or the Ionic may have been taken over at a later time than the Doric from a wooden original. Or, again, the Ionic columns may have been developed as an isolated pillar only to be adopted into temple architecture later. The traditional Ionic entablature consisted of architrave, or beam, and projecting roof, that is the cornice; it had no frieze.

A few years ago it was thought that the caryatide supports at the Erechtheum were a freak of design, but they were in use in the sixth century, and probably had even then a history, for the further we go back the nearer we get to a time when statues and pillars coalesce, and when the pillar was itself a sacred thing.

Acroteria, Roofs, etc.

Another very curious architectural member is the acroterion, which was set on the gables, sometimes one and sometimes three. These were not late ornamental additions, but they seem to have been essential and important features from an early age. Primitive builders seem to have made much of the point of the gable by crossing the rafters, or by setting there some animal's head. The developed form is usually much in the shape of a lyre with two strong horn-like branches, one on either hand, turning into scrolls and palmettes. It seems possible that they may derive from horns of consecration.

Roofs were either covered with tiles, that is, large pantiles with covering rolls, or by marble copies of the same, wrought and adjusted with amazing precision. They either dripped along the eaves, or they were turned up at the bottom into a sort of low parapet, later the cymation, having at intervals jutting spouts like toy cannon, or lions' heads with open mouths. There were hip roofs at the Propylæa.

Variety.

In the later period of the fifth century the aim after a perfect type led to standardising arrangements and forms and endeavouring to perfect them along a very straight line. But before the fifth century there are very wide variations in even the simple Doric type. In the architecture of Ionia variation of detail was aimed at in the same building. In the sixth-century temple of Diana at Ephesus all the base profiles are separately designed, the shafts have different numbers of flutes, some being even narrow and wide alternately, and the Ionic capitals are varied like those in a Gothic church. In the much later Apollo temple near Miletus there is a similar intentional variety of details. At the end of the fifth century black stone was used for the plinths or friezes in contrast to the rest of the walling. At the Erechtheum, sculptured white figures were pinned on to the black background.

here we have something tangible, if subtle. These modifications may be used to bring about unity. If the eight columns of a portico incline towards the axis and there is some adjustment in the spacing, you do not have one factor repeated eight times, but together they make up one whole thing—a portico. Curvature of lines again furnishes an intermediate between the straight and the rounded, between cornices, columns, and sculptures. It takes off the hardness, as we should say. It will correct any look of sagging in horizontal plans, and it varies the lighting on surfaces. Such adjustments are most natural in a highly refined school of architecture.

Conclusion.

This mysterious Greek architecture was but one customary way of doing buildings, after all; and recent researches have shown that in origin the forms are barbaric and accidental—accidental, that is,

the Propylæa, which he measured with a foot-rule. With regard to the latter building, it was interesting to note the substance which covered the stone to a depth of rather less than one-sixteenth of an inch. He spoke about this to Schultz and Barnsley, who were at Athens at the time, and learnt that Greek buildings were polished by slave labour. Mr. Bolton then referred to the model of the Parthenon at the Crystal Palace. This model contained all the curvatures and refinements that existed in the Parthenon itself. That grandeur which they saw in the model they would realise ten times over by personal inspection of the actual building. There was some subtlety that gave it so impressive a character. St. Peter's, Rome, produced comparatively no impression at all.

Mr. Henderson, seconding the vote of thanks, said that Professor Lethaby had

NORMANBY PARK, LINCOLNSHIRE: BOUDOIR. WALTER H. BRIERLEY, ARCHITECT.

Proportion.

There is no doubt that the Greek builders delighted in setting out their buildings and their several parts in dimensions which had relations one to another. As the building was to be perfect every part was related, in theory, to every other part, and a unity was supposed to result because accident was excluded. The real proportions of a structure were, of course, determined by tradition, purpose, cost, situation, and materials. The rest was a slight modification superimposed afterwards, a getting rid of the half-inches, as it were. But any hope of solving the question, as the idea of looking for such proportions has been a most disturbing factor in the study of Greek buildings.

Curvature.

It is quite different with the modifications by curvature and other adjustments;

in the sense that with other conditions they would have been different. There is a little æsthetic mystery about the mud walls and wooden props which became a cella and peristyle, or in the overhanging eaves which became a cornice. The wonderful thing is the Greek spirit, and if we would share that we should concern ourselves with perfecting stock-brick walls, chimneys, and downpipes rather than in designing pseudo-dipteral peristyles and Doric triglyphs—that is, as builders—as scholars, let us know all that may be known.

DISCUSSION.

Mr. Arthur T. Bolton, proposing a vote of thanks, said what must have struck them all was that Professor Lethaby had rewritten the history of Greek architecture. He (the speaker) had spent only a fortnight in Athens, where he had confined himself to the temple of Nike Apteros and

mentioned the temple of Diana, and had made special reference to the craftsmanship. The marble pavement was polygonal, and under the plinths of the columns the marble was in larger slabs. The production of the egg-and-dart was quite simple. The flutings were curved over, the edges cut off, and the dart thus obtained. The egg could be produced by the simple impression of a spoon.

Mr. Theodore Fyfe contributed a few remarks upon the planning of Knossos, and Mr. Gerald Horsley observed that Professor Lethaby had gathered the threads of history into one delightful piece of woven work, and had cleared up many points that had proved puzzling in the past. With regard to the covering of stone buildings with plaster and paint, was this quite suitable to our Northern clime? He doubted whether white buildings would look so well here as in the South. Greek

building, as Professor Lethaby had pointed out, was essentially common-sense building; and all English architects who were worth anything at all should treat building from the natural standpoint.

Mr. Walter Millard said that the lecture, useful and entirely interesting as it was, should be chiefly valuable in stimulating them to learn for themselves.

Mr. Arthur Keen agreed with this view, and referred to the time when he had the advantage of being associated with Professor Lethaby in his travels abroad. Professor Lethaby had always been most thorough and painstaking in his studies, and had confined himself exclusively to some particular architectural feature until he had thoroughly mastered it.

VARALLO, ORTA, AND VARESE.

At a general meeting of the Leeds and Yorkshire Architectural Society held last week, Mr. F. C. Eden read a paper on "Varallo, Orta, and Varese," three small towns situate amidst the romantic scenery of the Italian lakes of Como and Maggiore. The connecting link between these places was, he said, that each possessed a noted sanctuary in its Sacro Monte or Holy Hill—a wooded slope dotted with chapel-like buildings, imparting a character of architectural romance to the whole mountain side. These chapels were erected with the idea of reproducing the sacred chapels of Palestine, and were not built for religious func-

their principal heads—fluvial, lacustrine, and marine. He described the characteristics of each of these classes, and the chemical and mineral composition of brick-earths, giving analyses of some typical clays. Mr. Buck went on to describe various methods of manufacture. He ventured suggestions on some of the scientific problems that at present confront the manufacturer in the process of drying and burning. He also gave an interesting description of two principal kinds of kiln. In the finished product, continued the lecturer, strength, durability, and appearance were of prime importance, and of these probably durability was the most desirable. Mr. Buck was of opinion that colour and effect were best left to the taste and

Photo: Thomas Lewis.

NORMANBY PARK, LINCOLNSHIRE: BEDROOM. [WALTER H. BRIERLEY, ARCHITECT.

Professor Lethaby, replying to a question concerning the relationship between the Indian and the Grecian egg and dart, said that there was a strong general Greek influence over India, especially on the north-west frontier, where Greek detail was taken up. When he referred to plastering he did not use the word in its modern sense, nor did he necessarily mean what is commonly called plastering. What he did want for our buildings was a film of some kind that would act as a skin. A close relationship between Egypt and Greece had been propounded 60 years ago; but it was then pointed out that a very long gap occurred between the two. Ægean work filled this gap; and we had an example of work of the 15th century B.C. existing on Greek lands.

Mr. H. W. Cashmore announces that his connection with the Bromsgrove Guild has been severed. Further particulars will be found on page v. of this issue.

tions, but solely to shelter groups of painted life-size figures forming tableaux of the Redemption story. By means of a series of views the lecturer showed that these small buildings, although hitherto almost unnoticed and the work of obscure or unknown architects, were of absorbing interest, regarded as items in the Renaissance development, much of their detail in fresco and sculpture being worthy to rank with the best of its period.

THE MANUFACTURE OF BRICKS.

Before the Sheffield Society of Architects and Surveyors, a lecture was given last week by Mr. W. G. Buck, Licentiate of the R.I.B.A., on the subject, "Bricks and Brick-making Material." After dealing briefly with the geographical distribution of brick-making materials, Mr. Buck gave an outline of the nature and causes of the various deposits, and classed them under

skill of the architect. In conclusion, he referred to bricks as being amongst the most important materials that architects and engineers were called upon to use. It is therefore gratifying to find that professional men are apparently paying increased attention not only to the selection but to the details of manufacture of bricks.

OUR PLATE.

The new building for the Anglo-American Oil Company which has been erected on a site at the western end of Queen Anne's Gate, Westminster, with an extensive frontage to St. James's Park, is one of the most important business buildings of its kind which have been erected in London. The façade to St. James's Park is shown by the Centre Plate in this issue. The architects were Messrs. Ernest Runtz, F.R.I.B.A., F.S.I., and Son, of 64, Victoria Street, S.W.

THE SO-CALLED "DISTANCE POINT" IN PERSPECTIVE.

The subject of perspective drawing being of much interest to architects, we publish below a letter relating to the review of Mr. Storey's book, and our reply.

To the Editor of the Architects' and Builders' Journal.

SIR,—I have been much interested in perusing the article which appeared under the heading of "A Royal Academician on Perspective," in your issue of February 1st. I have gathered from this, both from its quotations as well as from its criticisms of Mr. Storey's book, that perspective is a subject no better known to the architect in general than to the painter in particular. I am able to agree with all the remarks of the writer with reference to certain portions of Mr. Storey's book, and also his criticism of perspective books in general, but I am quite unable to follow him through his affected precise dealing with the placing of the point of distance: because, in the first place, he has himself so hopelessly confused the function of a distance point with that of a vanishing point; and, in the second place, by reason of the fact that, in recognising the ingenious nature of Mr. Storey's suggestion for overcoming the inconvenience of an inaccessible "distance point," he has shown that either Mr. Storey or his critic, or both, have here confused the same distance point with what is in reality an inaccessible measuring point.

A glance at Fig. 6 of his own diagrams will further explain what I suggest in my first contention. The diagram is obviously intended, apart from its nomenclature, to show the vanishing of the sides of a parallelogram when put into perspective, viewed under certain conditions. The parallel sides of the parallelogram are shown converging to their respective vanishing points on an assumed horizon line. The writer is perfectly correct in his description of the method for finding these points, but these points when found are vanishing points, as their use implies, and are not "distance points." The writer's definition of a distance point then would possibly in a measure be correct, if it be taken as applying to a vanishing point and not to a point of distance. The points of distance have in reality nothing to do with vanishing points, excepting as in the case instanced from Mr. Storey's "Rules of Perspective," which refers to a distance point found by a line drawn at 45 degrees from the spectator's eye to the horizon line. The point of distance in this case would coincide with the vanishing point of horizontal lines receding from the picture plane at an angle of 45 degrees, but it is still a vanishing point, just as any other point on the horizon line might be, whether at 45 degrees from the eye or not.

The meaning and finding of a distance point can probably be better understood from the suggestiveness of the term itself than from anything said by way of elucidation by Mr. Storey's critic. The distance of the point of the eye from the picture plane (as is elsewhere shown in the article) is a distance assumed by the perspective worker himself for the sake of effect, and for his own convenience in working. But when once assumed, it remains so fixed throughout the whole of the perspective drawing. The distance taken account of in the finding of a distance point is the

perpendicular distance of the eye from the vanishing line (or horizontal line in this case), and the distance point is found by setting off this distance along the vanishing line, from the point in the vanishing line perpendicularly opposite the eye. By reference to the diagram below it will be seen that, as I have previously pointed

out, the distance point here would coincide with the vanishing point found by drawing a line at 45 degrees from the eye to meet the horizon line.

There may be any number of distance points in a perspective drawing, according to the number of planes and vanishing lines dealt with, but there can only be two in each vanishing line, and they occur at equal distances to left and right of the point in the vanishing line perpendicularly opposite the eye, and found as I have previously described.

In my second contention, which has reference to the facilitated dealing with an inaccessible "distance point," the writer has utterly confused the distance point with what is in reality a measuring point. The point under discussion is shown, in his diagram Fig. 7, by name as "distance point," but it has been employed for measuring from the corner (b) along the line (b s,) a perspective distance (a o) equal to the geometric distance (b a). The distance (b o) is measured perspectively equal to the length (b a), because (if drawn correctly) the line (a) passing through (o) is drawn in the direction relative to (b a) and (b o), so that it shall lie

between them as the base of an isosceles triangle: thus measuring (b o) equal to (b a). The point in the horizon line to which the line (a o) is produced is therefore, by reason of its use, known as a measuring point.

I need only say more for the purpose of showing the theoretical basis on which the expediency shown in Fig. 7 is built. It will be seen that the line passing through s and what is here termed the distance point is parallel to the line (b a), and that therefore the triangles—(distance point, o, s.) and (b, o, a) are similar, and that, therefore, if the two lines which are parallel be proportionately and oppositely divided, the lines drawn to these points of division would pass through the same point o: thus showing that this expediency is one for measuring by means of more accessible points, and that therefore, as I have before stated, they are termed proportional measuring points.

W. M. WHITEHEAD.

[We give space to the above letter, but it is only an example of the mere verbiage with which the subject of perspective is overloaded and confused.]

The diagram, Fig. 7, in our article of February 1st, is Mr. Storey's, not ours; it is merely reproduced from his book, and we are not responsible for his nomenclature.

By "Fig. 6" in our article we presume the writer means Fig. 5, as the remarks are not applicable to our Fig. 6 (which also is traced from Mr. Storey's book). If he means Fig. 5, the points to which the lines of the two interiors converge are no doubt vanishing points; we never said otherwise, and, in fact, we called them by no name at all. The writer has apparently confused one diagram with the remarks on another one.

What we wanted to point out is that there is no sense in regarding a "distance point" as a kind of "constant" to be found by drawing a quadrant from the spectator's position to the picture plane. In Fig. 1, below, where a square normal to the picture-plane is shown in perspective, the quadrant curve gives a point which is in fact the vanishing point of the diagonal of the square, and could be found

Fig. 7.

equally by drawing the straight line from *s* to *vp*, parallel with that diagonal. But now suppose the square canted to the picture-plane, as in Fig. 2; the vanishing points of the two sides and of the diagonal, at *a*, *b*, and *c*, can be found in the same way, by drawing lines parallel to them from the station-point *s* to the plan of the picture-plane. And now let Mr. Whitehead add his quadrant which cuts the picture-plane at *d*, and which he and Mr. Storey regard as a kind of permanent function in perspective—an ideal “distance-point,” always existing—and tell us what on earth that distance-point (*d'* on the horizontal line) has to do with the formation of the picture. Nothing whatever; it is a point in the air, entirely negligible as far as the picture is concerned. The actual distance of the spectator from the picture-plane is shown on plan. What we want in the picture is the apparent direction of lines in the picture as influenced by the spectator's distance from the picture-plane. What we want for the picture are the vanishing-points of lines; if there are any lines at an angle of 45 degrees with the picture-plane, their vanishing point will, as a matter of fact, coincide with what is called by writers the distance-point; but that is a mere accidental coincidence, there is no essential principle involved in it. The actual measurable distance of the spectator from the picture-plane is shown on the plan, and it is only on the plan that it is of any importance; on the “horizontal line” of the actual picture it is merely one out of various vanishing-points, in most instances (except in the conventional system called “parallel perspective”) less used than any other; and to use language which assumes “the point of distance” to have some special importance in drawing the picture itself is only to lead students to confuse accidentals with essentials. The expression “distance-point” ought in fact to be confined to the plan, and all the points taken on the horizontal line should be called “vanishing-points,” and then we should have more consistency in nomenclature.—*ED. A. and B. J.*

PROFESSOR BERESFORD PITE ON THE BUILDING ART.

At a meeting of the Institute of Builders, on February 1st, Prof. Beresford Pite, F.R.I.B.A., delivered an address on “The Teaching of Building Construction with Architecture.”

Building construction, Prof. Pite said, might be studied not only as a science in itself, but as a doctrine of design—the design being but the expression of essential facts—e.g., the lintel and the arch (the former being the ruling constructional principle among the Greeks, and the latter that among the Romans) are simple fundamental constructional facts, yet are distinctly beautiful forms of design.

The architecture of ancient Greece was exceedingly simple in construction; the practice of their builders going little or no farther than that of the lintel and column; but upon that principle—so subtle and refined was their sense of beauty—they built the whole of the architecture we know as the Classic of the three great orders. This sense of refinement led them to introduce the entasis on the column shaft, the slight camber on the entablature and soffit of the lintel, and the small variations in the spacing of a row of columns so as to overcome the inevitable optical illusions connected with these forms or groupings.

The Romans appeared to get farther than the Greeks in the principles of construction, their great idea being that of the arch. They were masters of massive construction, but, having built their houses, they looked around for someone to furnish them with architectural embellishment. This demand the Greek artists satisfied by supplying the architectural forms or orders slightly modified into a decorative treatment, and ornamental furnishings were supplied by sculptors, artists, and craftsmen.

The Gothic builders of mediæval times were constructionalists first, and artists afterwards; and from the simple semi-circular arch of the Romanesque they advanced to the complicated forms of arcade and vaulting, of which the Chapel of Henry VII. at Westminster is such a notable example. Upon the main lines of their constructions they worked their artistic ornaments in the deeply recessed mouldings so characteristic of mediæval architecture.

With this view of architecture as the ideal one, it is necessary for architects to keep up to date with constructional developments.

Architecture may be considered, of course, as a purely decorative art, quite apart from construction; and it was so treated by the Romans; and under the same category may be placed the study and veneration of antiquarian architecture simply because it is old; also modern revivalism and some phases of Renaissance Art.

In order that the architect should work successfully and practically in the detail of his work, it is needful that he be intimately acquainted with the nature and qualities of the materials he proposes to use, if not the actual craftsmanship required to manipulate them; but Professor Pite protested that he was not one of those who would advise architectural students to follow any prolonged course of study in brickwork, masonry, or metal working, because the result of such study cannot fail to be otherwise than destructive of the finer powers of handling the pencil for purposes of design. Nevertheless, a practical knowledge of the crafts cannot be otherwise than beneficial to the designer, who should always work on sympathetic lines with the material.

He then came to the subject of how far it was necessary for builders to study architecture, and how far such a study would be desirable or interesting. Builders are an absolutely necessary part of society, as a country cannot grow without them. The buildings of a nation form a solid record of its development, mentally as well as materially. The bulk of the buildings that are erected in this country are done probably without architects, and therefore without architectural thought or design, from the great factories down to the small speculative houses; and, so far as these are direct, serviceable, and unaffected, they illustrate the architectural age in a simple and effective sense. But education to some extent in architecture will be needed if builders are to cultivate their minds in the direction of the æsthetic—e.g., true proportion, propriety of ornamental detail, etc. To acquire any degree of proficiency in this requires much study and constant practice, with wide knowledge; indeed, it amounts almost to a gift, and it is hardly to be expected that practical builders, with all their multifarious duties, can find time to devote themselves to this branch of the building craft. It is possible, however, to a limited degree. A builder who is always erecting churches, or country farm buildings, or, indeed, any other form of specialisation, cannot do otherwise than become an expert

in the particular line which he practises; and, with general practice, if he keeps his observing faculties well employed, will, as experience increases, acquire a very fair general knowledge of the architectural style of the building he knows best, and the detail proper to it.

Ruskin's view of art, as expressing the enjoyment a man experiences in the execution of his work, stands quite good in regard to such building work, the art being that little margin of pleasure or profit which such a man puts into it after the fulfilment of the more material and prosaic parts of the work.

Education in technical matters is eminently needful to the aspirant for a place in the building trade, but the student soon reaches its practical limits. Professor Pite said that he naturally spoke with great diffidence and hesitation as to recommending a course of study in architecture to builders; but without reserve he would say that a young man should be well grounded in the principles of geometry and freehand drawing, and, in addition, in as much more of the principles of constructive science and decorative art as he can find time to digest.

Technical education equips the hand in order to give expression to the ideas of the mind. Building science and architecture have been divorced far too long in our technical schools. The joiner should be taught not only how to frame up a four-panel door, but what proportion the panels should bear to the whole, and what the shapes of the mouldings may be. Similarly in brickwork and masonry, the student should learn not only how to set out and cut an arch or pilaster, or work a column with cap and base, but how to draw a properly proportioned column or a regular arch, and what shapes of the caps and bases should be in the architectural style which he is illustrating. Progress in technical training has come to the point where more than empty skill is required, and general education on architectural principles will be conducive to good and important work.

If the artisans and builders of the future rise to the occasion and follow the course indicated, cultivating a sense of fitness and beauty in building work, the reproach of cheapness and ugliness will gradually disappear from our modern buildings. It is really absurd, when one thinks it out, and is an evidence of topsy-turvydom in these matters, that saying a building is new is giving it a bad name. New districts should really be more beautiful than old ones, if the general sense of the æsthetic advances.

In conclusion he would say that even if the work you are engaged upon is not beautiful in itself, if you do it well it acquires a beauty by that very act which by its reflex action is of distinct benefit to yourself and all those engaged with you upon the work.

A WATER FILTRATION PLANT.

We have received a very attractive pamphlet dealing with the new pressure filters which Messrs. Mather and Platt, Ltd., of Manchester, have constructed for the Bolton Corporation Waterworks at Sweetloves. The installation here comprises sixteen filters, housed in well designed brick buildings. These filters are of the well-known pressure type—closed steel cylinders, 8ft. in diameter, holding specially graded quartz crystals, after passing through which the water enters the town main purified. The plant is a very efficient one, admirably arranged, and with special means for cleansing the filtering material as required.

METAL WINDOW FRAMES.

It is very obvious that much of the prejudice against fireproofing methods is due to the supposition that they do not make for beauty. What gave rise to this impression was, perhaps, the uncompromising utilitarianism of the earlier methods, whose promoters naturally laid strong emphasis on the object they had chiefly in view, and in their zeal for fireproofing had but scant regard for appearance. This first crude conception has been gradually but continually corrected, and recent developments show a decided reaction against unsightli-

gressed, there is a very legitimate attempt at decorative treatment, while there is no attempt to disguise the natural characteristics of the material.

The extensive introduction of metal window frames is rapidly becoming a matter of common practice, and examples of such use are found in many of the most important recent buildings. Fire-resistance, economy of window space, and the consequent minimum obstruction of light, are the primary advantages secured. Probably the most striking instance is the Liverpool Cotton Exchange, where

iron, by Messrs. Walter Macfarlane and Co., of Glasgow, and extend with the architectural order through three floors. The shop window frames and entrance on the ground floor are also of cast-iron. This metal proves eminently suitable for work of an ornamental character, and allows a pleasing refinement of detail not always to be expected of cast-iron work. Its adaptability to classic forms is clearly shown, and the three superposed bays impart an effect of dignity and solidity even more satisfying than if these features had been rendered in stone. The contrast be-

BUSINESS PREMISES FOR SELFRIDGE AND CO., OXFORD STREET, LONDON: PART ELEVATION.

ness, and even a movement towards decorative effect. Of course this effort can easily be pushed too far; for ironwork cannot be made "pretty" without detracting from the suggestion of strength which is native to the material, and ought not to be in any way disguised. In the examples mentioned below, the treatment is in every instance appropriate to the material; yet, while the canon of fitness is not trans-

the whole elevation to Edmund Street is carried out in steel encased in ornamental cast-iron. More recent notable examples are the Selfridge Store, and the new building in Regent Street which has been designed by Mr. Frank T. Verity. The accompanying detail drawings show the construction of the large windows of the main front of the Selfridge Store. They are of cast-

tween the two materials in Mr. Verity's building is hardly so satisfactory, the reason being that the windows of the first floor are in stone, and those of the two succeeding floors in metal. The architectural quality of cast-iron, the harmony of its association with stonework, and particularly its fire-resisting characteristics, will considerably influence and recommend its adoption in the future.

FIRE PREVENTION NOTES.

Fire Precautions at Turin Exhibition. The organisers of the International Exhibition which is to be held at Turin next year have wisely determined to do all that is possible to protect the buildings against fire. They have even gone the length of offering a prize for the best means of rendering wood and other naturally inflammable materials proof against quick ignition. It is stated that there was a large response, and that, after due examination of the means put forward, the authorities have adopted two very efficient chemical compounds—one, it would seem, applicable to wood, and the other to fabrics, and so forth. Moreover, all outside woodwork is being covered with asbestos paint.

other watchmen hastening to his assistance. The exhibition will have its own special supply of water, and for this purpose a huge reservoir is being constructed. This can be kept full by means of pumps, even while it is in use; and the contents can be discharged at a pressure of not less than 90 lb. per square inch from all the lines of exhibition hose. In any case of fire quickly getting serious hold of highly combustible goods—and it were idle to pretend the absolute impossibility of such a contingency—the sappers and engineers would be ready with special apparatus for blowing up the affected building, and thus isolating the flames. Any danger from short-circuiting of the electric wires has been provided against by the adoption of

20 square yards, and each provided with counter-weights, by means of which they can be easily and rapidly closed. Around the buildings there is a 16ft. passage, affording facilities for the fire-brigade men to reach unobstructed every part. The Italian authorities had arranged to install twenty-six hydrants here, and to these the British authorities have added thirty more; and there is also to be a direct supply of water drawn from the river by means of two powerful pumps, which are capable of delivering 1,000 gallons per minute.

Structure and Materials. The structural precautions are interesting. The space between the floor-boards and the original level has been tightly rammed with earth, to hold which in place a wall gin, thick has been built to the height of

Detail of metal window frame at first-floor level.

BUSINESS PREMISES FOR SELFRIDGE AND CO., OXFORD STREET, LONDON.

Fire Brigade and Water Supply. The fire-brigade organisation also inspires confidence. The town brigade comprises twenty-six non-commissioned officers and 200 highly efficient men; while the town water service is said to be entirely satisfactory. All over the exhibition area fire alarms are being installed, and at night as many as 1,200 men will be on duty on or about the building, each man being held responsible for the safety of a small area. Hydrants and hose are conspicuous in red boxes situated at points that are in no case more than about 38 yards apart. Any alarm that is given will sound not only in the exhibitions, but in the barracks for sappers and engineers. The watchmen have been specially trained in fire-drill; and the man who gives the alarm will then immediately rush to the nearest hydrant, draw out the hose, and play upon the fire, the

exceptional measures that have been recommended by a committee of experts.

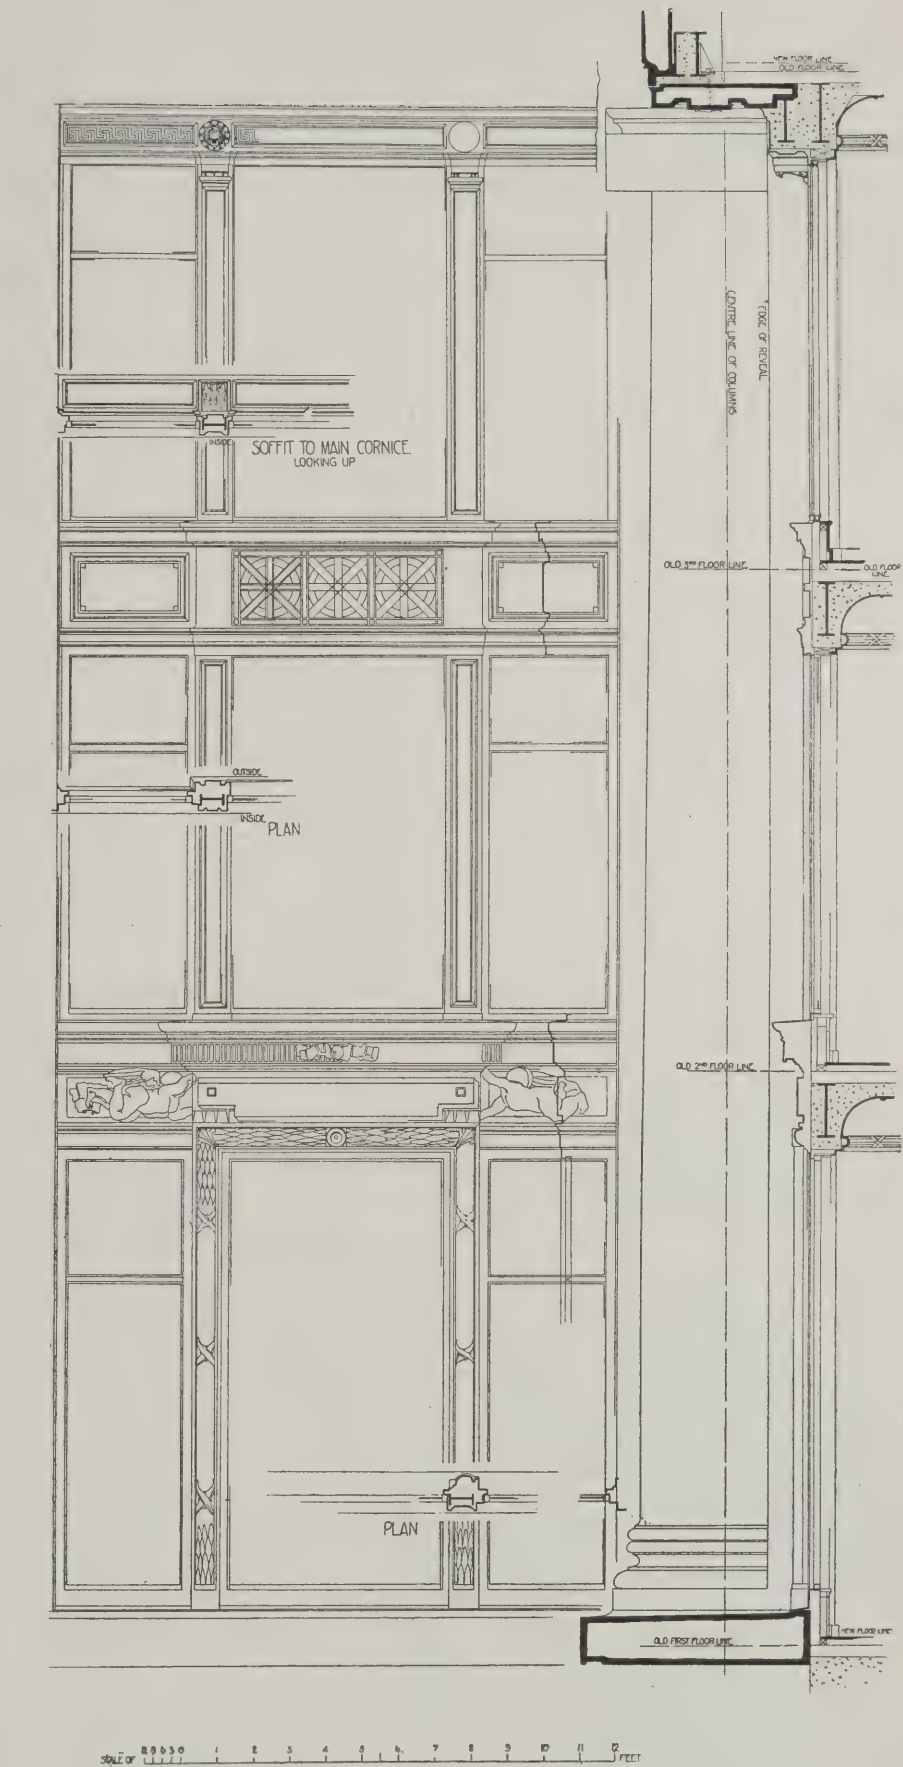

Precautions in the British Section.

Since it was the British section of the Brussels Exhibition which suffered most severely from the fire there, it is not surprising that the Turin authorities seem anxious to address to this country special assurances with regard to precautions against fire. The exhibitions branch of the British Board of Trade is also taking every possible precaution. The building for the British section will be virtually isolated, as it is only touched at a single point of one of its buildings, by the International Machinery Hall; and at this point a fireproof wall, 35in. thick, has been built across the entire 150ft. of contact, and rises 3½ft. beyond the corrugated iron roof. The wall is fitted with six iron doors, each measuring more than

the floor level, round the entire section. Internally, all the walls of the buildings are covered from top to bottom with Frazzi hollow bricks, 1½in. thick, which are covered with a ¾ in. coating of plaster. The pillars are to be sheathed with iron wire bearing a non-inflammable 1½in. coating of plaster. The ceilings throughout will be covered with metallic lathing substantially coated with plaster. The roofs of all terraces are being protected with galvanised iron, the woodwork of all doors and windows is to be painted with asbestos, and the doors in every case are to be fitted with panic-bolts. Besides the precautions against short circuiting, a complete system of lightning conductors is to be arranged. It is evident, therefore, that Turin, profiting by the misfortune of Brussels, is bent on setting an excellent example with regard to the prevention of fire in exhibition buildings.

Fire Protection for Oil Storage Tanks. The difficulty of dealing with inflammable fluids such as oil and varnish is so great that insurance companies are rather inclined to fight shy of the risks that are involved by the storage of such fluids. In one instance—that of a printing ink factory, where the oil used in the manufacture of the ink is exposed to the air for “bleaching,” and where lamp-black is made by the systematic firing of pits—the fire insurance companies, who were consulted before the factory was erected, insisted that the buildings should be upon the isolated block system, and should be of one storey only. This advice was followed, with the inevitable consequence that a large area of valuable space is doing but one-third or a quarter of the duty that the costly site would yield if it were adequately covered. The chief precaution against fire took, at one time, the primitive form of heaps of sand, each with a shovel stuck in the centre, disposed about the yard, ready to be thrown instantly on any outbreak of flame; the idea of extinguishing an oil or varnish fire being regarded as ridiculous. To-day, however, various fire-extinguishing compounds are available; and it would even appear that faith in the power of water to extinguish such fires has been restored; for it is announced that a scheme of fire protection for seven large oil storage tanks has been fitted recently by Messrs. Merryweather and Sons for a prominent oil company in the North of England. The installation comprises a petrol-driven “Hatfield” pump, which delivers water through a series of pipes arranged around the roof of each oil storage tank. A sprinkler pipe surrounds the top edge of the tank, this pipe being pierced with holes spaced at suitable intervals. The inclination of these holes is towards the side of the tank, and when the pump starts the water is forced at high pressure through the holes. It impinges on the surface of the tank at an angle of about 45 degs., and streams down the side of the cylinder, forming a protecting film of water. Should a fire occur in one of the tanks this film of water, with its cooling properties, should form an effective safeguard against the risk of the remaining tanks becoming involved. The supply of water can be controlled to enable the entire output of the pump to be concentrated on to one or more tanks, if desired. Satisfactory results were obtained when the installation was tested over a distance of 500ft.

Two Recent Fires in London almost simultaneously—the one occurring late last Thursday night, and the other in the small hours of Friday morning—were of widely different character, and remarkable in the one case because, in the house at 15, Curzon Street, Mayfair, Lady Crewe had, on the previous day, given birth to a son, and had to be removed to a part of the building more remote from the outbreak; while in the other case the striking feature was the rapid spread of the flames, the scene of the fire being Millwall Dock, where a good deal of timber was stored. In the Curzon Street case, the fire broke out in a room on the top floor, so that the firemen were able to confine it to the top storey; but the greater portion of the roof was destroyed. The brigade behaved admirably, and the fire was well under control in less than an hour. The fire at Millwall was first observed in a small gear-shed belonging to the Port of London Authority, and it soon took hold of a transporter railway, about a quarter of a mile long, supported on

BUSINESS PREMISES FOR SELFRIDGE AND CO., OXFORD STREET, LONDON:
DETAIL OF METAL WINDOW FRAMES.

wooden piers, and used for carrying timber, of which some stacks piled below the line were involved in the destruction, as well as a shed, about 100ft. long, in which timber was stored. About fifty engines were in attendance, and by strenuous and

well-directed effort, they at length succeeded in restricting the fire to a much smaller area than it was at one time expected to encompass. As it was, the damage was estimated at some £40,000 or £50,000.

THE EVOLUTION OF FIRE-RESISTING CONSTRUCTION.

BY WILLIAM WOODWARD, F.R.I.B.A., F.S.I.

In a paper, of which this is an abstract, read at the ordinary general meeting of the Surveyors' Institution held on Monday, February 6th, 1911, Mr. Woodward traced the evolution of fire-resisting construction, and concluded his paper with some useful precautionary suggestions applicable to new methods of construction.

TO the outside observer buildings are now erected—apart from questions of architectural style and taste (or the absence of them)—much as they used to be, but the professional man knows that, to employ a well-known expression, a “sort of” revolution has during the last fifty years or so taken place in fire-resisting building construction.

Early Use of Concrete.

But as early as 1835 we find Mr. George Godwin reading a paper on the “Nature and Properties of Concrete,” and on the architectural treatment of it. He showed how concrete had been used largely as a building material by all the principal civilised nations of antiquity; how Alberti had described walls made of it, nearly in the same way as is done now, by moulding it between boards; how Pliny had described cisterns made of it; and how many of our principal buildings, including St. Paul's and Westminster Abbey, stand upon concrete foundations dating from Roman and Saxon times.

Evolution of Fire-resisting Construction.

The evolution of fire-resisting construction in our buildings cannot be said to be of prolonged growth. It was the knowledge and appreciation of the uses and value of concrete, as much as of the uses and value of steel, which gave rise to that impetus in their combined uses which has culminated in what we know as reinforced concrete construction.

In 1854 architects were keenly discussing the construction of concrete floors, roofs, and walls, and their experiments led, no doubt, to a liking for the material as fire-resisting; as one which would carry very large unsupported areas, and which was cheap.

Many years before 1854 Fox and Barrett's fire-resisting floors, and the various kinds of similar floors as regards fire, were in vogue, and such firms as Homan and Rodgers and Dennett and Ingle were paying great attention to this important subject of fire-resisting construction, and French architects and engineers especially were devoting their labours to the same end; and although the French methods differed from ours in detail, much the same ideas prevailed, except that the French construction was always much lighter than ours—they took greater risks, and yet I have not heard of a case of failure in Paris due to collapse of a floor by reason of insufficient strength per foot superficial.

Early Fire-resisting Floors.

I find an interesting statement made by Mr. Wyatt Papworth, at a meeting of the R.I.B.A. in February, 1854, when the French and other methods of constructing iron floors were under discussion. An obelisk erected in 1776, on Putney Heath, by order of the Corporation of London, commemorated the satisfaction felt by committees of that body with experiments made in 1776, described in a pamphlet, printed in 1785, and entitled “An account of the invention and use of fire-plates for the security of buildings and ships against fire.” The resistance to fire was accomplished by applying the fire-plates above and below the timbers,

with dry sand or rubbish between them. A room was filled from floor to ceiling with fagots and pitch and tar, and the result seems to have been most satisfactory as a protection from fire. The inventor's experiments, however, showed that “the only way to check a fire was to prevent the access of air; for flame would inevitably calcine such materials as concrete and plaster.”

Proving that fifty years ago architects began seriously to consider concrete construction, I find that Mr. T. H. Lewis, on December 14th, 1857, read a paper at the Royal Institute of British Architects on some experiments upon concrete. Those experiments were directed to the suggested sensible loss in bulk of the ballast independently of that of the lime, and showed that the materials, after being mixed together, expand considerably.

A “Novelty” in the 'Seventies!

Then on June 5th, 1871, two papers were read before the Royal Institute of British Architects, with Mr. Edward I'Anson (a Past-President of the Surveyors' Institution) in the chair. One paper was on the use of Portland cement-concrete as a building material, by Mr. Thomas H. Wonnacott, in which he speaks of the “novelty of the material.”

The second paper above referred to was read by Mr. A. W. Blomfield on “Concrete Building.” This paper was confined to the consideration of concrete in walls constructed in situ, by filling concrete into cases or moulds, made to shift to the various heights and positions as the work proceeds. This system has, we know, since been very largely adopted.

Mr. Blomfield confined his remarks principally to the limits which the material imposes on architectural design and decoration. There can be little doubt that forty years ago fire-resisting construction in floors was greatly in favour, and Mr. Blomfield predicts its capabilities in that direction “without any adventitious aid of iron girders or other supports over considerable areas.

Importance of Good Materials and Honest Workmanship.

Mr. Edward I'Anson, in summing up the papers, made one or two useful remarks, which are quite as useful to-day. He was convinced that unless thorough dependence can be placed upon the honest and conscientious execution of the work by the contractor, concrete is a dangerous material to use, inasmuch as a small percentage of inferior material in Portland cement would cause the ruin of the entire work. Mr. I'Anson testified to the great desirability of not using cement too newly made, and mentioned that the Metropolitan Board allowed concrete buildings to be used in London, but insisted upon a considerable amount of iron hoop bond, and would not allow concrete walls of less thickness than brickwork. So that at this date “reinforced concrete,” in the shape of hoop iron bond and concrete, was adopted.

A Mid-Victorian Enthusiast.

Then in April, 1876—with Sir Gilbert Scott, R.A., President, in the chair—a paper was read at the Royal Institute of

British Architects by Mr. Alexander Payne on “Concrete as a Building Material,” and this principally dealt with it ornamentally for the fronts of the buildings so as to avoid ugliness. Mr. Payne observed—and this is an important matter in dealing with concrete and iron combined—that once you bed iron and keep it from the air you entirely protect it from rust and oxidation. Mr. Payne laid it down as an axiom that concrete offers unusual facilities as a material for walls, etc., “from the readiness with which iron or other ties can be embedded in it in any direction to resist any thrust or tendency to separate in the structure.” Mr. Payne showed a design for a street façade in iron and concrete, but I cannot say that it would induce me, personally, to substitute concrete for stone or brick. Mr. Payne would not imitate the projections of stone and brickwork, but would obtain as large wall spaces as possible and as few projections, ornamenting the work instead by indentations, calling to recollection the magnificent ornamentation of the Alhambra and of the Mahomedan buildings of India. Mr. Payne went so far, in his intense admiration for concrete, as to advocate the panelling of the interior of an apartment and “do away for once with the everlasting wall paper,” and he practically described reinforced concrete when he proposed to “use iron embedded in concrete for the purpose of giving tensile strength to prevent fractures caused by thrusts of arches, vaults, etc., instead of opposing them by buttresses as is done in brick or stone.”

Warehouses Gutted by Fire.

The above paper was followed by an interesting discussion. Mr. W. H. Lascelles referred to warehouses gutted by fire, where lintels consisting of concrete with pieces of iron, three inches by a quarter of an inch, embedded in the centre, were not affected by the fire, although the sills and other parts were. The concrete was mixed in the proportion of one of cement to six of breeze. Mr. P. Brannon was a great believer in iron and concrete, and he made window heads by bedding rods of angle-iron and dispensing with any framing or bresssummers. He had then put in concrete doors in St. Paul's Cathedral, under Mr. Penrose, “in order to render fire-proof that portion of the dome to which the public have access.” Mr. Brannon had then built some cottages in Derbyshire where the concrete walls were made with the “slag of furnaces ground with selenitic lime,” the compound being “nearly as good as Portland cement concrete.” Mr. Drake, at the same meeting, was most earnest in his partiality for concrete in floors, roofs, and staircases, and he asserted that good Portland cement concrete, or good selenitic concrete, or good lias lime concrete, correctly treated, “will never either contract or expand in the smallest degree after having once set.” Mr. J. Tull stated, at the same meeting, that slag from the blast furnaces was an excellent material because it is easily crushed and furnishes in the crushing a sharp grit. He did not approve of iron in concrete floors. Mr. Aitchison was desirous that experiments should be tried with and without the iron, “to show whether any or what additional strength is gained,” and Mr. Arthur Cates made some interesting references to the work of Mr. Brannon by which the cupola of St. Paul's was made fire-resisting.

“Fire-resisting,” Not “Fire-proof.”

It will be observed that I have generally used the term “fire-resisting” instead of “fire-proof,” as examples of large fires

prove that at the present moment there is nothing which has been invented to make a building "fire-proof." The most we can do is so to construct our buildings as to minimise as much as possible the risk from fire and smoke.

The London County Council General Powers Act, 1909, now enables skeleton-framed structures to be erected, at the same time permitting the reduction in the thickness of external walls in force under the Act of 1894; and so far as I have been able to judge, the anticipatory objections to the provisions of that Act have been modified, and it seems to work well and does not entail those delays and interferences which some members of the profession thought would be likely to arise.

Before coming to the most modern of fire-resisting constructions, viz., "Reinforced Concrete," I propose to say a few words on other methods. There are the plain and simple rolled iron or steel joists, some three feet apart, filled in between with concrete or breeze and Portland cement. These demand centering, and at times trouble is caused by the exudation of moisture just when it is not wanted.

Fire-resisting Floors.

One of the early floors, which still holds its own, is what is known as "Dennett and Ingle's." The steel joists are from 4 ft. to 10 ft. apart, according to the particular form of construction, in some cases the concrete is with arched and in others with horizontal soffits. Each method lends itself to either joists on plates bearing on the concrete, to wood block flooring, and to soffits either plastered on the concrete direct, or with ceiling joists and lath and plaster in the usual way. The material is concrete composed of highly calcined

gypsum and broken brick, or of Portland cement and an aggregate of broken brick and gravel.

We then get to the various forms of fire-resisting floors consisting of brick or tile arches between iron or steel joists; different forms of terra-cotta laid on the joists and carrying concrete, such as the Frazzi floor—all doing away with the necessity for centering—which is an important matter, not only on the ground of expense, but from the fact that centering keeps back moisture and rather lends itself to careless filling in on the part of the workman. The terra-cotta of these patent floors is made so that it can easily and accurately be laid in lengths between the steel joists and the soffits plastered afterwards. These floors are being made—and the system is also much used in partitions—so that nails can be knocked in the terra-cotta without enlarged fractures. I think also that they are as fire-resisting as could be wished.

The perfection to which cast-iron stanchions are now brought, and the enormous weights which they carry, leads one to question whether their continued employment is not superior to steel as regards weight in compression, and that, combined with ordinary steel joists, with either one of the patent floors or ordinary concrete filled in, to my mind brings us as near the perfection of fire-resisting construction as we can hope to attain.

We have all had to do, too, with wood floors, and there are still men left who would prefer—in cases of big fires that have got strong hold—a solid wood floor to all the steel and concrete floors ever invented. Some years back experiments were made with solid wood floors, i.e., wood joists of the usual scantlings, laid close

together, side by side, and I think the result of such tests was that these floors would stand concentrated heat better than the steel and concrete floors. I remember watching a fire, some years ago, where the building had a canted angle, and the supporter at each point consisted of a fir post 9 ins. by 9 in. The building was completely gutted, but the fronts were intact, due, I think, to the wood supports, which stood the fire well, and when I inspected them the following day I found that their centre parts had been consumed to within about 3 ins. I doubted very much whether steel stanchions or iron columns would have been left to tell the tale. We all know, too, that the most deceptive fire-resisting material is stone or granite in staircases, and stonework generally, brickwork and concrete being far more reliable.

Importance of Fire-resisting Construction.

The evolution, though, of fire-resisting construction in the form of reinforced concrete may be termed a revolution, because not only do we get it in floors and walls, but in piles and girders.

That too much care and attention cannot be given to any form of construction, or the employment of any material which will minimise, if not abolish, the risk from fire, goes without saying; and it is this dread of fire in buildings which necessarily alarms those upon whom falls responsibility in case of death or injury from fire. Recent occurrences in business premises make one tremble at the thought of fire where women and men sleep in brick houses, and where we know that an outbreak must result in a sad list of deaths. The London County Council have from time to time initiated legislation having for its object the relief of such risks, and they

DETAILS OF PORTE-COCHÈRE, NO. 16, AVENUE DE LA GRANDE ARMÉE, PARIS.

This is a good example of modern French work, the ironwork in the doorways, and the finely modelled lamp between, being especially characteristic.

PORTE-COCHÈRE, NO. 16, AVENUE DE LA GRANDE ARMÉE, PARIS. GABRIEL MORICE, ARCHITECT.

have by a recent Act permitted the use of steel-framed structures which will encourage their use and lead to filling in with fire-resisting material, and so gradually tend to lessen these too frequently recurring accidents.

Enormous strides have recently been made in the manufacture and use of reinforced concrete for all sorts of purposes besides building construction, viz., bridges, staircases, etc. Frenchmen may be said, I think, to have been the pioneers in this form of fire-resisting construction, but an English architect, Professor C. H. Reilly, has just constructed a church, at Shackleton, throughout practically of this material, and both in design and appearance, from the illustration I have seen, it does not present any feature of ugliness.

[This church was illustrated in the Journal of September 14th, 1910.]

Reasonable Precautions.

Mr. Woodward insisted with particular emphasis on the care required in reinforced concrete construction, and expressed the desirability of increasing the present knowledge as to expansion and contraction in concrete and steel work, and as to the possible oxidation of the metal, and he concluded his paper with some useful words of caution:—First, he said, see that you specify the best English Portland cement, and then see that you get it. Let Belgium and Germany keep their Portland cement for themselves. Then see that your Portland cement is not used too fresh, and that it is turned out of the sacks on to a boarded floor for, say, three days, and turned over two or three times in the interval. Then determine as to your aggregate. Avoid burnt ballast, but do not be afraid of well and evenly broken

brick mixed with stone ballast, or breeze, quite free from particles of coal. Then do not mind spending a little money on reliable clerks of works. A hundred pounds or so in salaries to such men, simply to supervise the mixing of the materials and the proper disposition of the reinforcement, may possibly save many thousands of pounds and many lives.

The evolution of fire-resisting material may apparently know no bounds; it has at the moment culminated in reinforced concrete put now to all sorts of uses. But may I say one final word to architects (I leave engineers to take care of themselves)? Do not tremble at your floors and roofs; be very confident about your walls; be a little over-careful with your piers or other vertical supports; but—but, be over, and doubly, and trebly anxious about your girders.

NEWS ITEMS.

Change of Address.

Mr. Lee Warner has removed the offices of The Medici Society (also his own publishing offices) from Albemarle Street to 7, Grafton Street, Bond Street, W.

* * *

An Amalgamation.

A company has been formed, under the style of the Penmaenmawr and Welsh Granite Co., to amalgamate the undertakings of Darbishires, Ltd., Brundit and Co., Ltd., and the Welsh Granite Co., Ltd.

* * *

German Cement Plant.

As a result of the operation of the Patents Act, some engineering works at Rochester have been acquired by an Anglo-German company for the manufacture of cement-making machinery of a kind hitherto produced almost exclusively in Germany.

* * *

Reredos for Liverpool Cathedral.

Mrs. Marke Wood, widow of a Liverpool merchant, has offered in memory of her husband to defray the cost, amounting to several thousand pounds, of a magnificent reredos for Liverpool Cathedral. The reredos is to be carved in stone, and will be 48ft. high by 43ft. wide.

* * *

Kensington Gardens Improvements.

Certain alterations decided on by the Office of Works are now in progress at the west end of Kensington Gardens, including the formation of a wide avenue approach to the public entrance to the State Apartments from Bayswater Road. The new pathway will be the full breadth of the old brick piers adjoining the orangery, and will also lead to the Dutch garden.

H.M.S. "Thunderer."

We have received from Messrs. Callender's Cable and Construction Co., Ltd., of Hamilton House, Victoria Embankment, an excellent photogravure plate of H.M.S. "Thunderer," built by the Thames Iron Works and Shipbuilding Co., Ltd., at Canning Town, E., and launched on February 1st last. On this our latest Dreadnought the main electrical distribution has been carried out entirely by Callender's cable and special boxes.

* * *

Town Planning in Practice.

The National Housing and Town-Planning Council has convened a national conference, to discuss details of practical town-planning administration, which will be held on Thursday and Friday next, February 23rd and 24th, in the School of Civic Design at Liverpool University. The subjects for consideration include the actual details of the various steps which should be taken prior to the presentation of a formal application to the Local Government Board for permission to prepare a town-planning scheme.

* * *

A Barracks Contract.

Early in the month of December last tenders were issued by the War Office for the erection of the cavalry section of the new barracks at Redford, near Edinburgh. More than fifty contractors sent in tenders. The contract has now been awarded to Mr. Colin Macandrew, 13, Lauriston Gardens, Edinburgh. It amounts to about £100,000. Two years will be occupied in carrying out the work, which is the first portion of a large scheme, the total cost of which is put at £300,000.

Restoration of Glasgow Cathedral Roof.

The members of the Glasgow Technical College Architectural Craftsmen's Society recently visited Glasgow Cathedral for the purpose of inspecting the work in progress in connection with the restoration of the roof. Mr. M'Leay, clerk of works, of H.M. Office of Works, Edinburgh—from which permission for the visit was granted by Mr. Oldrieve—conducted the party. Among other things shown to the visitors were a pile of old oak rafters belonging to the thirteenth century, which were used in connection with the original construction of the building. While most of these rafters were in an advanced stage of decay, a number were seen to be remarkably well preserved. The construction of the new roof was begun in May of last year. The work is progressing rapidly, the portion of the roof above the choir being farthest advanced.

*Street Lighting by Gas and Electricity:
A Comparison.*

The Holborn Borough Council recently decided that there was room for improvement in the lighting of the streets, and the matter was referred to the Highways Committee. The gas companies and the electricity companies were invited to give demonstrations of their lighting, and afterwards to deliver sealed tenders. The result, as reported by the Highways Committee, was as follows:—The official tests showed that the electric lamps gave an average of 395 c.p.; and the gas lamps an average of 318 c.p. The tender from the gas company was for £7,527 per annum, and the Electricity Supply Company's tender was £6,602 per annum. The Highways Committee, however, recommend that the lighting should be placed in the hands of the gas company for the next 10 years. At last week's meeting of the Council the committee's recommendation was referred back, a majority being in favour of electric lighting.

A Chair of Civics for London.

In the course of his address when opening the Cities and Town Planning Exhibition at Crosby Hall, Chelsea, Mr. John Burns, President of the Local Government Board, said he hoped that civics and town-planning would be made one of the subjects of the curriculum of the London University, and that a chair of civics might be founded there, as had been done in Liverpool University. He was there to persuade the London University to imitate Liverpool University, and if there was any public-spirited man, like Mr. Lever, who was willing to give him £30,000 with that object, he would be glad to transfer the money to-morrow morning. In the past they had scandalously neglected the question of civics and town-planning to an extent which they now had to rectify. Every fifteen years 500,000 acres of land, an area larger than the county of Middlesex, was converted from agricultural and rural land into factories, workshops, and similar buildings.

A Handy Catalogue of Builders' Requisites.

A catalogue (No. 30) that has just been issued by Messrs. Young and Marten, Ltd., Stratford, London, E., consists of 406 pages (8½ in. by 5½ in.), with illustrations on every page, showing drain-pipes and foundation materials, timber and wood goods, plain and ornamental glass, architectural cast and wrought ironwork, sani-

tary engineers' appliances, baths and lavatories, grates and chimney-pieces, decorators' materials, ironmongery, door and window fittings, and gas and electric fittings, under which headings is comprehended most of the information that an architect or builder is likely to require respecting the ordinary run of requisites, and there are also some special lines, such as the "Hue" Fire, of which Messrs. Young and Marten are the sole proprietors. The "Hue" fire is upon the barless principle, coming low down on the hearth, and warming the room without wasting its heat up the chimney. It is manufactured to suit the base area of existing grates; and an ordinary tile grate, provided its back is in good repair, can be converted to the "Hue" system in less than thirty minutes. The catalogue does not conspicuously bear the name of its producers, a point that is often appreciated where the book is consulted in the presence of clients. Its very handy size is an additional recommendation.

A TECHNICAL DICTIONARY.

The present volume of this really important series of technical dictionaries has been prepared with the same scrupulous care and thoroughness as its precursors. The editor claims in a passage in his preface which may perhaps read somewhat less pompously in the language from which it is translated, that "The technical world of all civilised countries has participated in the preparation of this volume"; and a list of contributors and revisers comprising about a hundred and fifty names is at all events sufficient proof of the catholicity of the collection, although we regret to notice how inadequately Great Britain is represented, and are hardly the less sorry because the book does not seem to have suffered any consequential detriment.

Forms relating to wood-working machinery occupy about one-third of the volume, but, from our point of view, constitute the more valuable portion of the book, the rest of which is concerned with metal-working machines. There is also a special section showing figures and sections of different varieties of timber. The 2,400 small illustrations are an extremely useful feature of the volume, being well drawn, and seldom superfluous. It may be said, also, that the value of the work is to some extent enhanced by its omissions; the editor having very wisely decided to disencumber it of such commonplace terms and expressions as need no elucidation. Where the terms are given in six languages, this is at once a dangerous thing to do—because the commonness of a term does not necessarily exclude it from the category of words for which one could not readily find (for example) the Russian equivalent—and at the same time it results, no doubt, in a considerable economy of space, while sparing the reader the annoyance of continually meeting with terms which are not really technical, and are therefore to be found in ordinary bilingual dictionaries. These technical dictionaries in six languages are, at any rate, of high value and authority, and occupy a unique position among technological works, fulfilling very thoroughly a function that had been previously performed very inadequately.

The Demhardt-Schlomann Series of Technical Dictionaries, in Six Languages (German, English, French, Russian, Italian, Spanish. By Alfred Schlomann. Vol. ix., Machine Tools (Metal Working, Wood Working. Compiled by Wilhelm Wagner. Containing over 2,400 illustrations and numerous Formulae. London: Constable and Co., Ltd., 10, Orange Street, Leicester Square, W.C. 9s. nett. Pages x.—706, 4½ ins. by 7 ins.

THE INSTITUTE COMPETITION DESIGNS:

CRITICISM BY PROFESSOR C. H. REILLY.

The criticism of the R.I.B.A. students' competition designs always brings out a great deal of valuable comment; and Professor C. H. Reilly, as principal of the Liverpool University School of Architecture, speaks ex cathedra. The following extracts from his well-considered appreciations will therefore command more than ordinary attention.

PROF. C. H. REILLY, M.A. Cantab., said in the course of his criticisms, that the exhibition before us in its broadest aspects is the best indication we have of the general state of architectural thought among the younger generation. Students' work, at any rate in England, follows very closely—much too closely, I venture to say—the trend of current architectural taste, and whether an exercise be supposed to be in the principles of Palladio, Vignola, and Chambers or not, the result is generally a pretty faithful reflex of the latest competition devices of our competitively successful architects. In the absence of any national system of training in design it could hardly be otherwise. A year ago it was my good fortune to see in America the designs for the Stewardson scholarship, which holds there a similar position to our Soane medallion. The chief difference, as it strikes me now, was not that the best work was better, but that in one hundred or more designs submitted for this one prize the general level of accomplishment was considerably higher than it is here. Among our students we have evidence before us to-night of many men of brilliant imaginative power and great artistic ability, but they seem to lack that technical accomplishment in design, that knowledge of architectural effects and possibilities, which is necessary for ability fully to justify itself. But if the best men suffer from lack of continuous training in design, how much more do the lesser? Indeed, the main advantage of schools of design—the only modern equivalent to consistent architectural tradition—is that the general level is raised. Every one has remarked that in a time of strong tradition like the eighteenth century very little absolutely bad work was done, and the same results apply to the organised teaching of design which every country save our own now possesses.

He suggested that the Institute should make training in design the keystone of its system. History, mathematics, construction, materials, everything else, should be subsidiary to what after all is our main excuse for existence. Instead, therefore, of a couple of small designs and an elaborate system of written papers, he suggested the Institute should substitute a minimum of papers and a series of designs to which the Tite and Soane might be a fit culmination. He thought that the winners of these prizes might be allowed to qualify for membership just as the Prix de Rome, *ipso facto*, obtains for its holders their diplomas of the Ecole des Beaux Arts.

Ultimately, all works of art must live by their appeal to the imagination; that is the divine fire without which the cleverest rendering, the deepest scholarship are but negative accomplishments; and there could hardly have been chosen two subjects making a more immediate appeal to the imagination than those for this year's Soane and Tite prizes—a bridge and gateway to a capital city, and a wooded island in a lake set apart for the solemn rites of burial. They are ideal subjects, and our students—and all of us for the matter of that—should be encouraged to dream dreams; so-called English common sense and love of compromise will follow fast enough in practical office work.

The Tite Prize.

We need not despair of the future of our art when we have among us men of the poetical temperament of "Ek Thanatou Nikos," or capable designers like "Catafalque," "Apex," and the winner. The very capable design of Mr. Foggitt, "F. 13," is the most Italian design sent in, Bramantesque in general character. Mr. Foggitt has also made more of the Italian idea of a campo santo than the other competitors. Cutting a great wedge out of his island he has contrived a broad sloping way up to his chapel, flanking it on either side with arcaded terraces set back one behind the other. At the head of the slope stands the finely composed façade of the chapel, the dome of which crowns the island. The unobtrusive perspective hardly does justice to this effective approach. Where Mr. Foggitt has failed, I think, is in that the idea of a lonely island set apart for the solemn rites of burial is hardly conveyed by his pleasant scheme, which suggests rather a happy secluded convent building set among its terraced vines on some sunny Italian hillside. Mr. Foggitt's drawings are somewhat dirty in execution.

"Catafalque," who is placed second, sends a much better set of drawings *qua* drawings than the winner. I commend his half-inch detail as an example of how classical architecture should be drawn, with a quiet pencil or washed-ink line, and geometrically yet tenderly shaded. He has designed for his main building a temple-like structure with a finely conceived portico, and has wisely placed it, as the Greeks would have done, some little distance up the hillside, leaving the mountain behind to form a background. The interior of this building is particularly good. Half-way up his long sloping approaches, however, stand two octagonal structures for columbaria, and these are rather a blot on his scheme. They suggest to me both by their shape and detail garden pavilions rather than tombs. But the whole conception, if a little long for the island, is quiet and dignified, and the detail, except for one or two lapses, such as the archway with a broken cornice, and the pediments without any tie in the Newgate-like niches, is good and expressive. The perspective is a very pleasant drawing, embodying well the quiet serenity of the design; the buildings are seen in silhouette against a setting sun near the water's edge reposing ready to welcome the advent of the happy dead. To me the whole idea of this design is more truly classical in spirit than of any other.

"Ek Thanatou Nikos," if he has failed to win the prize, will win his victory from life itself. His two perspective drawings have the solemnity and mystery of an early Maeterlinck drama. I think his main building, with its high enclosed atrium, has something of the remoteness—the dignity combined with simplicity—that we find in the best Greek work. He has justified his use of Greek detail, if any justification were needed, by a quotation from Chambers: "It should always be remembered that the stream is purest at the head." His detail, indeed, shows considerable scholarship, especially in the row of

monuments in the niches, each differing in design. It is a pity they have been so carelessly drawn. Greek architecture calls for the purest, most delicate delineation. Besides his central building he has a quiet retired landing-place, and a little village set in a fold in the cliff, from which rises a circular stair to the headland on which he has placed his temple. All these are interesting and romantic features in themselves, but they are not bound into one architectural design, and the reason for this is the shape of his island. The author has assumed the shape to be that of a skull. It is an interesting idea though a non-architectural one, but that would not matter so much had it not hampered his design. It is really akin in spirit to the triangular lodge at Rushton Manor to symbolise the Trinity, or John Thorpe's scheme for his own home in which the plan spelt J. T. It is a pity so clever a designer should have been carried away by such an idea.

"Apex," to whom a certificate of honour has also been awarded, sends a very sensible set of sepia drawings, a little sloppy in finish due to their pencil line. Cockerell, and our great classic architects, always used a thin ink line. I would recommend to "Apex," and, indeed, to all who do not know them, the collection of Ecole des Beaux Arts drawings of the sixties, seventies, and eighties, published by the "Intime Club" of Paris, and called "Croquis d'Architecture." Here, among a certain amount of bad Gothic, you can dig out all sorts of monuments, to each of which the architects of the Greek Revival, from Garnier to Pascal, have given, what only Frenchmen seem able to do, the appropriate architectural expression. I found these drawings in use in each American school I visited.

Perhaps the schemes I have mentioned form the first class. The next, not far behind, would include "Red Diamond," "Charon," "Fate," "Naos," and "Catacomb."

The Soane Medallion.

The Soane has not produced this year to my mind so good a competition as the Tite, either in numbers (12-19) or in the general quality of the work, yet in these days of civic design an entrance to a capital city should have been an attractive subject. "Civitas" has sent in a thoroughly Beaux Arts set of drawings, even to the gold borders and the carefully composed frontispiece of details. The plans, sections, and elevations are all made things of interest in themselves. The draughtsmanship, if somewhat uneven, reaches in places a very high level indeed. The drawings are shaded throughout and made intelligible to laymen. In England we are wont to play up too much to the man who boasts he can never understand a plan, and I am sure the public appreciation of our art suffers in consequence.

"Mauerthor" has had an honourable mention given him for his clever essay in François Premier architecture. The Soane is not restricted—unfortunately, I think—to the fine classical architecture practised by Soane and his contemporaries. It is therefore open to anyone to send in what the Americans would call an essay in archaeology, and in this case it has been done with American thoroughness. The main gable, well shown on the half-inch drawing, exhibits all the varying scales, the uncertain grasp of motifs, which characterises such early work when ideas which since have blossomed were only in the bud.

"Silab," who also receives honourable mention, submits a very modern design. His perspective, which is full of fine colour

and fine feeling, shows him to be by nature a genuine and considerable artist.

The Grissell Prize.

The Grissell is given for construction rather than pure form. The subject was a large skating rink to be built and roofed in wood. Unfortunately, none of the competitors is adjudged worthy. "Oregon," whose building is quiet and satisfactory, has certainly attempted to design a novel form of roof. He has bifurcated his trusses above the hammer-beam, branching them on diagonal lines, which gives somewhat the effect of cross-vaulting, and at the same time braces the roof against wind pressure. If this roof would stand up—and I am assured by authorities it would not—it would certainly afford a striking and interesting interior. I think as an example of the "architecture of adventure" it deserves some credit. The drawings, too, are well made, and the roof construction clearly explained. The remaining designs are not very happy.

Measured Drawings Medal.

Seeing that the Pugin is worth £40, and is devoted to mediæval work, I wish the Institute could see its way to increase this medal from £10 to a like sum, and confine it to Classic and Renaissance architecture. Frankly, what is wrong with a good deal of our classical architecture to-day is that it is still too Gothic. Until we have devoted as much time to the study of classic forms as our predecessors did, and our Pugin enthusiasts do to-day to Gothic ones, we shall not make headway. At the same time we should learn to draw them in a style suited to their character. Classic architecture is an affair of light and shade rather than of line. It should be rendered therefore in light and shade, and the thick line drawing, which we owe to Burges, should be kept, if kept at all, for Gothic work. "Ethandun," the winner, has indeed sent shaded detail drawings of the Gothic building he has measured, and very well they look. His black line elevations are not so pleasing, and his surveys a little careless. The latter, however, are supplemented by many sheets of full sizes plotted on the spot, for which he deserves and has no doubt obtained credit.

The Pugin.

Some drawings are crisper, some more spotty, some water-colour drawings are cleaner than others, but beyond that what can one say? It is a matter more of craftsmanship and industry than anything else. Mr. J. B. F. Cowper, the winner, who is to be congratulated on winning the Ashpitel prize as well, sends six good perspective sketches of towers and spires, three in line, three in colour. He has measured several parts of buildings in the special wavy Pugin students measure. He has, however, included among these latter the façade of some almshouses at Nantwich, which but for the date, 1638, one would imagine were modern artisan dwellings.

The Owen Jones Studentship.

The Owen Jones Studentship has produced two good sets of drawings by Mr. Bellis and Mr. Oakley. The drawing by Mr. Bellis of the Pompeian decoration from the Castle of St. Angelo is particularly good. His colour, though, is not as good as his draughtsmanship, for some of his drawings suggest the reproductions in Mr. Owen Jones's book rather than the thing itself. Mr. Oakley is more daring than Mr. Bellis, in that he submits several sheets of original designs. Attempting more, he has made a high failure rather than an easy success. His decoration often conflicts with the lines of his architecture, and I am afraid his panels would reduce his council chamber to a restaurant.

Arthur Cates Prize.

Mr. Henderson, who wins this prize, sends some charming sketches chiefly from Italy, and a design for a Carnegie library. The latter, to my thinking, rather negatives the former. His best drawing is of Peruzzi's delightful Santa Maria Carcere at Prato. Why, I wonder, has Mr. Carnegie's personality ousted that of Peruzzi from Mr. Henderson's mind? Mr. Vey's drawings are not so good, though perhaps his design is better. Bay windows, however, running through several storeys, are difficult things to harmonise with a really strong cornice.

The Institute Essay Medal.

The winning essay, Mr. Honeyman's, on the design and construction of belfry stages and towers, is a very valuable piece of real research work, showing throughout intimate first-hand study and a thorough knowledge of his subject. Although only two essays have been submitted, the winner's amply justifies the Council in changing the type of essay subject to one involving research and scholarship. On the other hand, I do not like to see the more philosophical type of subject entirely abandoned. Could not we have both? Different types of men would be attracted, the man of ideas—the designer, in fact—to the one, the scholar to the other.

DISCUSSION.

Sir Aston Webb, R.A., proposing a vote of thanks to the President and to Professor Reilly, said he gathered that the remark which met with most satisfaction was the offer of a prize to students for the next annual address. [See the President's address in last week's Journal.] A more entertaining evening would have perhaps been provided if the President had permitted the address to be delivered there and then. Turning to Professor Reilly's criticism of designs, Sir Aston said he thought that students would feel fortunate in having so competent a critic for the task. It had, perhaps, been a little severe, but it was done in a kindly spirit by one who knew. Advancing to the easel containing the portrait of Mr. Ernest George, and drawing the curtain which had hitherto concealed it from view, Sir Aston said he had much pleasure in asking the President to accept the portrait of Mr. Ernest George, (vigorous applause greeted this remark, and continued for some minutes.) Proceeding, the speaker said they all knew Ernest George—Ernest by name, earnest by nature, and earnest in his work. All who knew him loved him. He was essentially and all-round an artist, who looked upon his work only from that point of view. The portrait was an excellent likeness, and the pose of the hands was to the life. They were indeed fortunate in having Sir Hubert von Herkomer to paint this portrait, which would grace and add history to their walls as nothing else could possibly add to them. He hoped the President would convey their best thanks to Sir Hubert von Herkomer for now having a work of his hanging upon their walls.

Mr. Selwyn Image, seconding the votes of thanks, observed that there was one thing in the President's breezy, virile and invigorating address that touched him "on the raw." Mr. Stokes stated that the public schools taught very little drawing, and that the universities were only just beginning to recognise even the existence of architecture. He was there as representing the University of Oxford, and wished he could say that the President had misrepresented things, but unfortunately he

could not. A certain Oxford M.A., seeing an acquaintance obviously bound upon some mission, asked what it was, and was told that a gathering was to be held to celebrate the send-off of the new Slade Professor. Rather astonished, the M.A. replied: "My good friend, you don't mean to say that Oxford takes the Slade Professor seriously?" But they had taken him seriously, although they did not fully recognise the fine arts, and that queen of arts, architecture. So far as his efforts could go, he would be spurred on by that pregnant sentence of the President's; and while he occupied the chair at Oxford he would bring home to Oxford the necessity for recognising architecture as the queen of arts.

Mr. Ernest George (who was greeted with prolonged applause) said it was very gratifying to have so flattering a representation of one who had been President for only two years. He thought that it was a grand thing to possess works by the modern masters; and he was very glad to be placed among the presidents of the past.

Mr. Leonard Stokes, on behalf of the Institute, then formally accepted the portrait.

Professor C. H. Reilly, in briefly acknowledging the vote of thanks with which his name had been associated, said he was afraid that, having to go through over 300 drawings, it was very difficult to do justice to all the works. He had looked through the addresses of his predecessors, particularly that of Mr. Waterhouse, and had come to the conclusion that candid criticism was the only kind of criticism worth anything at all.

AN ANCIENT LIGHTS CASE.

In the Chancery Division of the High Court of Justice on February 3rd, the case of Neale v. Wallis and Sons, Ltd., came before Mr. Justice Eve. This was an action for an injunction to restrain the defendants from building so as to obstruct the light to the plaintiff's windows. It appeared that the plaintiff carried on business at No. 73, New Bond Street (on the east side) as an auctioneer and valuer of works of art. The premises had been used for some 45 years for the examination of jewels and other works of art, for which purpose the light hitherto enjoyed was alleged to be essential. On the west side of New Bond Street, and nearly opposite to the plaintiff's premises was No. 99, which the defendants had pulled down, and they had erected on the site a building which was some 22ft. higher than the building pulled down, and which the plaintiff alleged would seriously diminish the light coming to the plaintiff's windows. This the defendants denied. Mr. Justice Eve, in the course of his judgment (as reported in the "Times") said: "It appears that of the defendants' frontage some 4ft. 6in. is opposite the plaintiff's frontage, and of this 4ft. 6in., 12in. to 18in. are opposite the window on the ground-floor chiefly affected by the defendants' operations. The angle of obstruction to the sill at the centre of the ground-floor window has been increased by the raising of the defendants' building from 34½ deg. to 48 deg., which reduces the distance by which a beam of light comes over the defendants' premises through the top of the upper sash of the plaintiff's ground-floor window into the ground-floor from 17ft. 8in. to 9ft. 8in. But I think on the whole evidence the plaintiff has failed to establish an actionable nuisance, and accordingly I dismiss the action with costs."

DUNKELD CATHEDRAL RESTORATION.

In the year 1820 the choir of Dunkeld Cathedral was repaired. At a lower level

originally belonged to the interior. At the same time, to shorten the choir, a thick wall was built parallel to the east end. The late Sir Donald Currie offered to bear the cost of a new roof, the removal of the partition walls and galleries, and the

beautiful walls of rubble or ashlar masonry. A few additions in the way of furnishings have been fitted, including an oaken pulpit, oak screen, and communion table towards the east with an ambulatory, and at the west a small gallery for the

DUNKELD CATHEDRAL · VIEW OF CHOIR LOOKING EAST. RESTORED BY W¹ DUNN AND R. WATSON, F.F.R.I.B.A., ARCHITECTS.

than the original roof was added a new one, which fitted in a rather clumsy way against the east gable; it was finished on the inside with unsightly plaster vaulting, jointed and coloured to represent stone. This vault was comparatively low, and entirely destroyed the lofty proportion that must have

reseating of the choir. The new roof has been built to the slope of the original one, shown against the gable. The tie was placed high up in order to preserve the lofty proportions of the building. Beyond this, little restoration has been attempted. A coating of plaster was removed, exposing

organ and choir, with a vestry underneath. The passages and the main body of the church are paved with old stones, but an oak wood-block floor was placed under the new pews, and a heating system has been installed. Messrs. Dunn and Watson, F.F.R.I.B.A., were the architects.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editors desire to give notice that answers to the following enquiries can no longer be undertaken :—

- (1) Enquiries about buildings to measure in particular towns and districts.
- (2) Enquiries embodying questions which have been set in examination papers.
- (3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Cleaning Leadwork.

H. B. writes: "I have recently completed a two-storey bay window, and have covered the space between the head and sill with leadwork, the ornament of which has been tinned; but owing to the smoky atmosphere of the town it soon gets very black and dirty. What do you consider the best material with which to clean it down periodically, with a minimum amount of labour? It should be something that will not damage the leadwork or tinning."

—No entirely satisfactory method can be recommended, as in any case cleaning down will render the leadwork more susceptible to staining in future. Probably the best that can be done is to wash with plain water; and if this is not sufficient to remove the blackness, a little fine silver sand could be used with it, though this will roughen the surface and cause dirt to adhere more readily. Acids could of course be used for cleaning, but would render the bright metal liable to tarnish very quickly, besides probably staining or discolouring the work below. All things considered it will be best to leave it alone, and remember in future that a smoky town atmosphere is not favourable for the display of bright metals. G.

Privet Hedge to Preserve Right of Light.

R. W. writes: "Is a privet hedge, if allowed to grow to a certain height, sufficient to preserve any right of light to a house that may be built on the land in the position shown on sketch plan? The houses marked A and B were built five years ago. The land hatched in belongs to A, who will probably build a house in

a few years' time, and who desires to protect any right of light. C is the window of B's house, 5ft. high by 8ft. wide, and 3ft. from ground to sill."

—I understand this question to refer to the already existing window in the side of the adjacent property belonging to B, and that it is wished to prevent the acquisition of a right of light by B in such a way that the "future house" may be difficult to build hereafter. (1) I take it that all these plots were purchased from one person under a building scheme; if so, it will probably be found that there is a special clause in the "conditions of sale" or "building regulations" attached to the contract (under which the land was bought) which covers the whole ground by preventing the acquisition

REINFORCED CONCRETE ROOF.

of such a right as you now fear, in which case the matter is settled for you, and you may safely leave the whole thing alone. (2) If there is no such clause in the contract of purchase, or if you have no information upon the subject, I rather doubt whether your privet hedge is sufficient to protect you, and I should advise you to erect a board opposite B's window, or that you should obtain a written acknowledgment from him, accompanied by the payment of a trifling rental as an acknowledgment that the window is not an "ancient light." An "ancient light" is one which has been in existence without interruption for 20 years, but it should be remembered that such a light cannot be stopped when 19 years and a day have elapsed since its construction. F.S.I.

Reinforced Concrete Roof.

W. D. (WORSLEY) writes: "I am interested in a projected building of reinforced concrete. It may be about 100ft. long, with a cross-section giving inside measurements of 20ft. clear span and 10ft. from floor to ceiling. It is very desirable that there should be no projections inside the building, and I want to know if it is possible to form the roof in reinforced concrete, quite flat on the underside, and with, say, 2ins. rise towards the centre of the span on the outside. I am aware, of course, that for stiffness beams or slabs should have a good depth; but as this roof will have nothing but itself to carry, and a possible fall of snow, I would like to make it, say, not more than 8ins. maximum thickness. A section is here given, and I should be glad to have your expert's opinion as to the feasibility of the suggestion, and the amount of reinforcement which would be required."

—A roof slab without ribs can quite well be built as suggested. It would need to be constructed of good concrete, proportioned 1 cement, 2 clean coarse sand, and 4 broken gravel or granite or sand stone, graded from 1/4in. to 3/4in., not exceeding the latter size, and all below 1/4in. being counted as sand. If 8in. thick at the centre, and 6in. at the supports, it would require, on the basis of limiting stresses, 600lbs. in 2 in the concrete, and 16,000lbs. in 2 in the steel, 3/4in. dia. rods at 7 1/2in. centres. There is no need for the buttresses shown on the section sub-

mitted. The walls would be sufficient; or columns could be provided, and the wall between reduced. It must be recollected that the detailing of such a roof requires experience, and should be done by a specialist. We cannot take any responsibility for suggestions as to designs of this nature, for the circumstances may be different from what is represented, or may be materially altered by other conditions not furnished; and the workmanship, too, is beyond our control. These columns are not intended for our correspondents to get gratuitous designs, for which an architect or engineer should be paid.

Open Joisted Floor.

Under the above heading we published in our issue for January 25th (page 96) an answer to an enquiry concerning the proposed construction of floor joists as beams in the ceiling below. This method, it was pointed out, would prove rather unsatisfactory unless adequate precautions were taken against the conduction of sound, and the use of deadening quilt was suggested. Cabot's quilt, it may now be added, is excellent for this purpose, laid between the floor boards and the joists. It has been used in conjunction with a similar floor to that shown in the diagram which accompanied the reply to the enquiry. The material is supplied by Messrs. Arthur L. Gibson and Co., Radnor Works, Strawberry Vale, Twickenham.

Canterbury Cathedral.

W. G. L. (WESTGATE-ON-SEA), writes: "Please furnish information respecting (1) the materials used in the building of the various parts of Canterbury Cathedral, and (2) a book dealing with the construction and history of the chapter-house."

—With regard to (1), the clerk of the works at the Cathedral would probably be able to supply the information required. (2) An admirable work on the architecture and construction of Canterbury Cathedral is that by Willis, issued in 1845. This contains a number of plates (8vo and folding), including some in colour. The work is out of print and scarce, but Mr. B. T. Batsford, of 94, High Holborn, London, can supply a copy for 18s. post free. Canterbury is included in Bell's "Cath-

dral Series," price 1s. 6d. net (postage 3d.), but this is only a brief illustrated history.

Sea Sand for Building Purposes.

E. J. P. (DUBLIN) writes: "Please reply to the following queries relative to the value of sea sand for building purposes:— (1) From what part of the shore should the sand be removed? (2) To what depth should the sand be excavated? (3) Should the sand be bleached? What length of time does this process take, and in what manner should it be carried out? (4) Is sea sand thoroughly suited for lime and cement mortar, and in what proportions should it be gauged?"

—(1) The sand would most conveniently be taken from that part of the shore where it is cleanest and most free from large stones, so as to reduce the labour of sifting. (2) The sand may be dug out of holes to any depth that is convenient, having regard to the foregoing remarks. (3) The sand need not be dealt with in any way except sifting to get the fine sand passed through a $\frac{3}{16}$ in. mesh sieve, as is necessary to get it to work well in mortar. (4) Sea

sand is quite suitable for lime and cement mortar, but the salt may effloresce; and if that is not desired it might be washed or soaked in fresh water. The proportions generally employed with Portland cement are for plastering 1:2, and for brick or stone work 1:2 or 1:3. The last is quite good enough for most purposes. When hydraulic lime is employed mortar should be proportioned for plastering 1:1, and for brick or stone work 1:1 or 1:2.

Book on Stresses in Structures.

J. H. writes: "Kindly give particulars, price, and publishers, of books dealing with stresses in structures by the method of sections or method of moments. 'Iron Bridges and Roofs,' by Prof. Ritter, is a book that deals with the subject, but I am informed that it is out of print."

—Ritter's "Iron Bridges and Roofs" is, as you say, out of print, but second-hand copies are sometimes obtainable. You will find much useful information, however, in Du Bois's "Mechanics of Engineering," volume I., a second-hand copy of which Mr. B. T. Batsford, of 94, High Holborn, London, can supply for 20s. net.

FIRE PRECAUTIONS IN CITY OFFICES.

A case that has been brought before the Tribunal of Appeal under the London Building Act, 1905, represents the first attempt of the London County Council to enforce section 9 of the Act with regard to City offices. The action taken had reference to Winchester House, Old Broad Street, E.C. The section in question, it will be remembered, refers to the provision of means of escape from fire in "(a) a high building; or (b) a building in which sleeping accommodation is provided for more than twenty persons, or which is occupied by more than twenty persons, or in which more than twenty persons are employed."—Mr. Astbury, counsel for the appellants contended that the means of escape from fire in Winchester House were ample, and that if the requisition of the County Council were complied with the building would be rendered less rather than more safe, and the structural arrangements would be materially interfered with. New staircases would have to be constructed, private corridors would be thrown open to the public, and swing doors would be provided in order to act as smoke checks. The Council, he said, "wanted to place nineteen doorways in this unfortunate building, and the result would only be to add to the danger instead of decreasing it." With regard to the Council's proposal to run a gangway through certain offices, counsel said that "the company would be breaking their leases, losing their tenants, be liable to actions, and generally have a very gay time for some years." In reply to a question from the President (Mr. A. A. Hudson), he stated that the number of people in the building during the daytime was about eight hundred.—Mr. Ernest Flint, architect and surveyor, giving evidence on behalf of the appellants, said he regarded swing doors as a source of danger, as accidents had been frequently caused by them.—Mr. P. Tubbs, architect, said that not one of the three requirements of the Council—the staircase, the alternative proposal of making the corridors continuous and public on each floor, and the swing doors—was necessary, considering the character of the building and the nature of the business carried on there.—Mr. Walsh, who appeared for the Council, seemed disposed to agree with a remark of the President to the effect that the proposed manner of applying the smoke doors on staircases would turn the staircases into flues; but what the Council said, he added, was that if both staircases were enclosed it was only in the million-to-one chance of two fires breaking out and involving two staircases at once that the difficulty at which the President had hinted would arise. By carrying out the Council's proposals the smoke would be confined to one staircase, and the other would provide a means of escape.

Mr. J. C. Stransom, of the Architect's Department of the L.C.C., gave evidence in favour of the Council's proposals, and the enquiry was then adjourned. On its resumption, Mr. A. Dyer, M.Inst.C.E., Divisional Officer of the Fire Brigade, said that he thought smoke-doors essential for the protection of life. In cross-examination, he admitted that he did not know of any purely office building in which the staircases were enclosed by doors, and that, taking into consideration the cross currents in this particular building, it was improbable that, in case of fire in the basement, the staircases would become smoke-logged.

VILLAGE HALL, SLIP END. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

—Mr. W. Woodward, F.R.I.B.A., said that in his opinion the means of escape from fire at Winchester House were inadequate, and that the requirements of the Council with regard to the staircases were reasonable.—Mr. H. D. Searles Wood, F.R.I.B.A., also supported the L.C.C. case.—Mr. Walsh, in his address on behalf of the Council, laid stress on the enclosing of the staircases.—Counsel for the appellants said that his clients had offered to adopt measures which ought to have prevented the present proceedings, which were very costly to his clients.—The President asked Mr. Astbury whether, in his opinion, the Tribunal would have power to vary the order so as to include things that were outside the notice, such as the fitting of iron doors to the storerooms.—Mr. Astbury thought that the Tribunal had not that power; but that his clients would raise no objection to an order being made in such terms.—The Tribunal reserved their decision.

A POSTAL ANOMALY.

Publications that are issued less frequently than once a week labour under grave disabilities with regard to postage. A weekly periodical, provided it complies with certain regulations as to contents (which must include a stated proportion of news items), may be sent through the post in the United Kingdom for a half-penny, even though it weighs as much as 5 lb.; but any publication appearing at less frequent intervals is charged in accordance with its weight avoirdupois; with the result that in some instances the charge for postage is equal to the price of the periodical, and in any case is strikingly disproportionate. This anomaly is, in the fullest sense of the phrase, "in restraint of trade." The chief sufferers, after all, are the public whose interests the periodicals exist to serve. The invidious distinction between newspapers and magazines (amounting virtually to a tax on the latter) should be removed. The General Post Office would probably lose nothing by the change; in time it is probable that there would be an increase in the revenue on this account. That, however, is a matter of far less importance than the general benefit that would accrue to the community from a less arbitrary restriction upon the circulation of valuable printed matter. While it is acknowledged on all hands that the most urgent need of this country to-day, if it is to continue commercially prosperous, is the spread and intensification of practical knowledge, the General Post Office obdurdly refuses to lend its aid in the diffusion of that knowledge. Its attitude on this matter is, indeed, quite incomprehensible. As a matter of mere conveyance, bulk is its only rational and practical concern; yet, nevertheless, it exercises a kind of censorship on the contents of periodicals, arbitrarily deciding what is and what is not news, and decreeing that every other class of matter shall be heavily penalised. Efforts have been made from time to time to relieve the General Post Office of the burdensome and invidious duty of insisting on these distinctions; and a new movement with the same object is now gathering force. We wish it all success; because the almost prohibitive postal rates imposed on magazines are equivalent in effect to an injurious tax on knowledge, which ought with the least possible delay to be entirely abolished.

SOCIETIES' MEETINGS.

Guild of Architects' Assistants.

The Guild of Architects' Assistants, at a meeting held at Prince Henry's Room, Fleet Street, on February 7th, had before them a "Mock Arbitration Case," arranged by Mr. J. Gerald Large, P.A.S.I.

The case was assumed to have arisen through certain amendments being demanded by the district surveyor, the architect refusing to accept the surveyor's interpretation of the Act. The builder, however, carried out the instructions of the district surveyor, contending that he had power to do so, as provided by Clause 5 of the R.I.B.A. Contract. The result is a dispute between himself and the building owner, the matter being referred to arbitration for settlement. The building owner makes a counter-claim for damages. Both claims were well contested and the evening was undoubtedly instructive to those members whose professional experience has not been associated with arbitration cases.

Manchester Society of Architects.

On February 8th, Mr. F. W. Jackson read a paper entitled "The Village." He first reviewed modern conditions and tendencies in art, and compared them with the conditions under which the great works of the past were produced, and then passed to the study of the buildings of a village on the north-east coast of Yorkshire, the village of Hinderwell. It was of no antiquity, and its church was ordinary; but, with a little search, one can see the rise and fall of its craftsmen. At one time there was something of the picturesque, but that element has almost gone, and is giving place to something that concerned him much. The old cottages show signs of a life that could appreciate beauty; these qualities are not to be found in the newer ones. Then one could find among the tombs in the churchyard some that show merit in their design and lettering; but who would visit the modern cemetery in search of beauty, although the modern mason is more expert? This leads one to consider what is happening to the dwelling-houses of our people. He showed examples of old-time simplicity and naturalness, and modern flashiness. He was no believer in the cry that we were a decadent people. We have become possessed of materials and facilities that the world has not known before in all the arts. The problem for students was how to adapt these modern conditions. It was no good to ignore them; we cannot in our village get the blacksmith, or the joiner, or the mason. As a painter, he deplored the colour of many of the new materials now in use in these smoky districts, and he thought the thing to strive for in our town was bigness of massing and a fine skyline. J. T. H.

The Society of Engineers.

At last week's meeting of the Society of Engineers (Incorporated), the chair was first occupied by the retiring president, Mr. Diogo A. Symons, M.Inst.C.E., who presented the following premiums awarded for papers published in the Society's "Journal" during 1910:—The President's Gold Medal to Mr. W. C. Easdale for his paper on "Sewage Disposal Ideals"; the William Clarke Premium to Mr. S. M. Dodington for his paper on "Public Slaughterhouses"; the Bessemer Premium to Mr. C. W. V. Biggs for his paper on

"The Inspection and Testing of Engineering Materials and Machinery"; the Nursey Premium to Mr. Henry C. Adams for his paper on "Current Professional Topics"; a Society's Premium to Mr. A. H. Allen for his paper on "Electricity from the Wind"; a Society's Premium to Mr. C. R. Enock for his paper on "Engineers and Empire Development." Mr. Symons then vacated the chair in favour of Mr. F. G. Bloyd, the president for 1911, who proceeded to deliver his inaugural address.

COMPETITIONS.

"Owen Jones" Competition for Wall Paper Designs, etc.

The Royal Society for the Encouragement of Arts, Manufactures, and Commerce, announce that the next award of the "Owen Jones" prizes will be made for designs which must be submitted to the Board of Education by April 1st. These prizes are given to students of schools of art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damasks, chintzes, etc. Six prizes will be offered for competition, each prize consisting of a bound copy of "The Leading Principles in Composition of Ornament of Every Period," from the "Grammar of Ornament," by Owen Jones, and the Society's bronze medal.

LIST OF COMPETITIONS OPEN.

FEB. 25. COTTAGE HOSPITAL, ST. AUSTELL.—Architects practising in the County of Cornwall are invited to submit designs for a cottage hospital to be erected on the Trewoon Road, St. Austell. Designs to be sent to the Hon. Secretary, Mr. Henry Hodge, C.C., Trevarrick, St. Austell.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee, E. Pearson, Corbridge.

MARCH 1. FREE LIBRARY, PENISTONE.—Competition limited to architects within thirty miles of Penistone.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 26.

FEBRUARY 17—MARCH 24. STREET IMPROVEMENT, SWANSEA.—Architects are invited to submit competitive designs and estimates for Castle Street improvement. Block plan and particulars on receipt of one guinea deposit, to be returned to competitors who fulfil the conditions. Premiums, not exceeding £250, for the architect appointed to prepare the working drawings; £50 to author of design placed second. Mr. J. S. Reay, F.R.I.B.A., has been appointed assessor. Applications by February 17th. Designs, March 24th, Town Clerk, Guildhall, Swansea.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Prof. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber,

F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

NO DATE. PARISH HALL, SWINTON.—The Vicar and Churchwardens of Swinton require plans, etc., for the erection of a Parish Hall and other buildings. Architects may obtain full particulars on application to the Rev. C. Steele, Swinton Vicarage, Rotherham.

NO DATE. ELEMENTARY SCHOOL, LOWESTOFT.—Twenty, ten, and five guineas for designs. Competition limited to Norfolk and Suffolk architects. A professional assessor will assist the Lowestoft Education Committee. Particulars on payment of 5s., from R. Beattie Nicholson, Town Clerk, Town Hall, Lowestoft.

NEW METHOD OF CONSOLIDATING CONCRETE PAVEMENTS.

A vibrator for compacting concrete roadways instead of the usual tamping methods was employed in building the Munger Boulevard at Dallas, Tex., by Mr. R. C. Stubbs, of that city, who has secured a patent for his device. The subgrade was prepared in the usual manner, and finished with its surface 5in. below the grade established for the pavement surface. A 1:3:6 concrete, mixed in an Austin cube mixer, was then spread to the full depth of 5in. and struck to the proper grade. A coating of medium sized broken stone was then placed upon the surface and boards or platforms laid over the pavement. Upon these the vibrator was operated, the planking being moved forward when one section had been consolidated. The vibrator consists of a motor-driven mechanism mounted upon a hand truck, through which the vibrations set up are transmitted to the planking and thence to the concrete below. The operation serves not only to consolidate the concrete itself but also to embed the stones in the upper portion of the concrete. The machine has a rated capacity of 1,000 sq. yd. of pavement per nine-hour day. The advantages of this method of consolidating concrete pavements, as set forth by its inventor, are that a greater density and more even texture in the concrete are obtained. The rapid succession of comparatively light blows delivered by the vibrator, in conjunction with the weight of the apparatus, are more effective, it is claimed, than tamping, since the air and water are driven out and the resulting mixture is practically without voids.

FEDERATION NEWS.

Midland Centre Conciliation Board.

A special meeting of the above board, to consider a dispute with the Nottingham carpenters and joiners, was held at the Imperial Hotel, Birmingham, on Tuesday, 31st January. Mr. J. B. Whitehouse presided, and there was only one member absent from each side of the Board. At the outset of the proceedings a vote of sympathy was passed with the family of the late Mr. John Matthews, who died last November, and who had sat as an operative member on the Board since its inauguration in March, 1906. The points to be settled by the Board were as follows:—Rule 1 (wages).—The operatives asked for an increase of wages, from 9d. per hour to 10d. per hour. Rule 4 (walking time).—The employers objected to any walking time rule. Rule 10 (notice of dismissal).—No notice at present required. The operatives desired two hours' notice for grinding and sharpening tools. The following were the decisions of the Board:—(1) That the present walking time rule be altered by striking out item C (viz., all workmen living outside the 1½ mile radius shall commence work at the proper starting times), and inserting the following words at the end of the rule:—"This rule does not apply to men set on at a job." (2) That rule 10 shall read as follows:—"One hour's notice shall be given or required of any intention to put an end to the service, and in default thereof either party shall forfeit or pay to the other side one hour's wages, such time to be applied to the tools or in continuation of work. Any workman discharged when working away from the shop to be entitled to walk to the shop in the employer's time, unless there is convenience on the job for grinding; if by train, third-class fare, or walking time at 3 miles per hour." (3) That rule 1 read as follows:—"That the standard rate of wages be 9d. per hour." (4) That the foregoing rules shall come into force on 1st July next.—FRED. W. AMPHLET, Employers' Secretary.

Barrow-in-Furness Master Builders' Association.

That annual meeting of this association was held on Tuesday, January 31.

The election of officers resulted in the re-appointment of Mr. W. Saddle as president, Mr. J. Baker as secretary, and it was resolved to ask the manager of the Bank of Liverpool to act as treasurer. The members of the various trades committees were re-elected.

It was reported that the Borough Engineer had agreed to the request of the association that only successful tenderers be asked to supply priced quantities in future, and that for tenders amounting to £250 and upwards separate tenders be asked for the various trades concerned.

Correspondence was submitted with the Federation re trade discounts, and complaints from some of the members on this question. Approval was given to the opposing of bills promoted in Parliament by Local Corporations for powers to do electrical wiring.—J. BAKER, Secretary.

Liverpool.

The annual dinner of the Liverpool Master Builders' Association was held at the Bear's Paw Restaurant, on February 7th, the President, Mr. J. T. Duthie, in the chair.

Responding to the Toast, "Architects and Quantity Surveyors" (proposed by Mr. Chas. Tomkinson), Mr. Arnold Thornely, F.R.I.B.A., said that so far as he could gather, the building trade in Liverpool had not been very good of late, but he believed there was a revival in the south of England, and he thought that the improvement must soon extend to the north.

Mr. Costain proposed the toast of "The Municipal Engineers and Surveyors," and Mr. Alexander responded.

Mr. J. B. Johnson proposed the toast of "Kindred Associations," which was responded to by Mr. James E. Beard, Past president of the Building Material Trades Association, Ltd.

The toast of "The Liverpool Master Builders' Association" was proposed by Mr. J. T. Jones (President of the Liverpool Property Owners' Builders' and Ratepayers' Association), and responded to by the President of this Association, Mr. J. T. Duthie.

Mr. R. Arthur Costain proposed a vote of thanks to the Secretary, Mr. Bertram B. Moss, who replied.—BERTRAM B. MOSS, Secretary.

King's Norton and Northfield.

The King's Norton and Northfield Master Builders' Association held their fifth annual dinner at The Exchange Restaurant, Birmingham, on February 2nd, Mr. Harold Grice presiding over a company numbering about sixty.

"The King's Norton and Northfield Master Builders' Association" was proposed by Dr. Garbutt, Councillor H. M. Grant responding.

The President proposed "The Local Governing Bodies. Councillor Watts replied.

"Kindred Associations" was proposed by Councillor R. E. Bull, and responded to by Mr. W. Moffat.

The toast of "The Visitors" was proposed by the Vice-President, Mr. J. H. Handcock, and responded to by Mr. E. Horton.

Mr. F. W. Amphlet (Secy. Midland Centre Federation), in proposing the toast of "The Presi-

dent," said that the National Federation, which was a very democratic body, was constantly sending down to the branches matters for their consideration, but when the various associations expressed their opinions on these questions, very often the views of only 20 per cent. or 30 per cent. of the membership were represented. When the Federation took action in accordance with what appeared to be the wish of members generally, and then found that the 70 per cent. or 80 per cent. of members, who had not troubled to make their views known, were not prepared to support such action, difficulties arose, and the real workers in the Federation naturally felt aggrieved and disheartened. Every member of every Association should feel his responsibility in regard to the work of the Federation. There would then be no limit to the far-reaching benefits and advantages which our great organisation could secure for its members.—H. H. COPELAND, Secretary.

Wakefield and District.

The monthly meeting of the Wakefield and District Master Builders' Association, was held at the Great Bull Hotel, Wakefield, on February 9th, Mr. James Pashley (President) in the chair.

The Committee of Master Joiners appointed at the last meeting to consider the complaint received from the Operatives' Joiners' Society to the effect that certain members of the Association were not carrying out the winter working rules with regard to working time, reported that, after making enquiries, they were satisfied that none of the members had infringed the rules, as suggested, and it was decided to write to the Operatives' Society accordingly.

Discussion took place on the question of a fair trades clause, proposed to be inserted in contracts with public authorities, and other associations, priced schedule of prices, prime cost items, and other matters affecting the trade generally and locally.—J. BEAUMONT, Secretary.

York.

The annual dinner of the York Master Builders and Contractors' Association was held at the Windmill Hotel, the Mount, York, on February 2nd, when the President (Mr. W. E. Biscomb) was supported by the Sheriff of York (Mr. F. A. Camidge), the President of the National Federation (Mr. J. W. White), the President of the Yorkshire Federation (Mr. A. J. Forsdike), the Senior Auditor of the National Federation (Mr. A. W. Sinclair), Councillor Hardgrave (Vice-President of the local Association), Mr. W. C. Creaser (Secretary of the Stockton and Tees Associations), and about 80 others.

Councillor Hardgrave proposed "The National Federation," and expressed the pleasure that was felt in the presence of the President, to whom he wished a successful year of office.

The President (Mr. J. W. White) referred to the work of the Federation, which, he said, was comprised mainly under three heads (1) the regulation of conditions of labour (2), the dealing with questions arising out of their work with architects and surveyors; and (3) the watching and influencing of legislation. He referred to the beneficial operation of the conciliation boards, the desirability of extending the use of the R.I.B.A. form of contract, the need for greater clearness in the quantity surveyor's details. He felt that it had become absolutely necessary to watch carefully legislation relating to industrial affairs. They had had the Workmen's Compensation Act, the new regulations as to scaffolding, Labour Bureaux, unemployment insurance, and Board of Trade returns. He thought it would be well if they could digest the legislation they already had, to see whether it was operating satisfactorily, before proceeding to add to the list. With reference to the Workmen's Compensation Act, there was much room for improvement. Too much malingering had arisen, and it had been encouraged by the decisions of the County Court judges, who were not properly trained men for such cases. They were essentially medical cases, and the judges were often taken in by a bit of clever acting. The result was seen in the increased premiums of the insurance companies. In his opinion, more use should be made, in this class of case, of the medical referee. In conclusion, the President referred to the damage and discredit brought upon the industry by the constant accession from the ranks of men who had no adequate knowledge of book-keeping, or of business methods, and who by their absurdly low tendering swelled the bankruptcy lists and did moral and material injury to an honourable industry.

Mr. W. E. Biscomb proposed "The Yorkshire Federation," He emphasised the importance of technical education in the building trade. He thought they, as an Association, should approach the educational authorities in the matter. Apprentices had not been made in adequate proportion, and in the event of improved trade there would be a scarcity of skilled labour.

Mr. A. J. Forsdike (president of the Yorkshire Federation), in reply, congratulated York on having such a successful and well organised association.

Mr. A. W. Sinclair proposed the City and Trade of York, and the tremendous appeal made to the emotions by York in its walls, churches, and the multiplicity of its many ancient buildings, and its glorious Minster.

Mr. Alderman Birch gave "The Architects and Surveyors" and Mr. S. Needham and Mr. J. W. Hame responded.—J. HAGUE, Solicitor, Secretary.

Supplement to THE ARCHITECTS' AND BUILDERS' JOURNAL, Wednesday, February 22nd, 1911.

PUBLIC LIBRARY, HARROGATE. HENRY T. HARE, F.R.I.B.A., ARCHITECT.

THE ARCHITECTS' & BUILDERS' JOURNAL.

CAXTON HOUSE, WESTMINSTER.

VOLUME 33. No. 839.

NOTE : The List of Contents will be found on page IV. of the front advertisements.

The Board of Trade London Traffic Report.

THE new Report of the London Traffic Branch of the Board of Trade is a most remarkable document, from the amount of statistical information it contains, both in printed statements and in maps and diagrams. A great deal of the matter contained in it refers to questions of the material and method of control of traffic which do not come

within our special province; but considerations as to the requisite width of roads, and the supply of routes between central London and the outlying districts, have a most important bearing both on the architectural effect of streets, and on the possibility of profitable outlay in building, according as a new building has adequate or inadequate road communication with central London. As is observed in the Preface to the Report, many vacant areas of considerable extent within 15 miles of Charing Cross could be made available for the erection of dwellings if proper access were provided; whilst in others, where building has commenced, progress is retarded by the want of suitable communications.

A word may be said first as to the maps and diagrams appended to the Report. Plate I. is a specimen quarter-sheet of the Ordnance Survey of six inches to the mile, showing the growth of building in a London district (in this instance Chiswick and Barnes) during the ten years from 1891 to 1901, and from that period to the present date; new buildings of the first decade being shown blue, those of the later decade red. This is given apparently as an example of a method which, if carried out for the whole district immediately round London, would be of no little interest and value. Plate II., to which we shall return, shows the existing main arteries out of London, and the additional roads proposed in the Report. Plates III. and IV. are coloured to show the population density of Greater London in 1901 and 1908, by twelve graduated colourings representing the amount of population per acre, from "2 and under," to "over 150." The respective densities have not altered much in the interim; the configurations of the central position are much the same in both maps. In the outlying districts one notices that Merton has advanced from "2 and under 5," to "5, and under 10"; in other words, has doubled its population; that of Tottenham has increased by one-fifth, Low Leyton to the same extent, East Ham from "20 to 30" to "40 to 50"; Greenwich remains stationary at "20 to 30," Lewisham has increased by one-third, Acton by the same amount, Ealing is stationary at 10 to 20. There is not much increase of population westward; the tendency seems rather northward and southward. Plate V. shows graphically in the same manner the comparative rate of increase and decrease of population in different districts; increase represented by shades of red, decrease by shades of blue; practically the same result shown in a different way. Finally, Plate VI. shows graphically the volume of traffic on each of the main roads leading out of London, according to the Traffic Census in the summer of 1910; the question of summer or winter in such a census is important, as in summer there is a great deal of holiday traffic which hardly exists in winter. The com-

parative amount of traffic is indicated by the width of the red bands covering the lines of the principal roads, radiating from central London in starfish fashion. Most of the traffic is considerably reduced before it reaches the 9-mile radius, some of it stops short of that radius. The routes which maintain a considerable traffic for the greatest length of road are those via Edmonton to Cheshunt, via Croydon to Coulsdon and via Brentford and Isleworth to Staines.

The main object of the present Report is to consider the improvement of and addition to arterial roads in and out of London, illustrated in the Plate II. already referred to; but before reverting to that we may notice some of the suggestions as to necessary width of road, in which we entirely concur. It is pointed out that for a main street with shops in it, and tramways in the centre, provision has to be made not only for two lines of traffic on each side of the tram lines, for vehicles moving at different speeds, but for vehicles standing and loading or unloading at the kerb, which means practically three lines of traffic on each side of the trams. Such conditions demand 85 feet in width of roadway, and 40 feet for the two footways. Even apart from the tramway question, the Report points out how inadequate are the 60 feet widths of Shaftesbury and Rosebery Avenues. In London that has always been our fault, making streets too narrow; fortunately the municipal authority does seem to have wakened up to the fact at last, and we have Kingsway and Aldwych 100 feet wide, without tramways; with tramways that would be too narrow. The Report proposes the following schedule of widths for roads of different classes in the neighbourhood of London:

	FEET
Main arterial roads not less than	100
First-class country roads, either radiating, or connecting places of importance	75 to 100
Second-class country roads	50 to 75
First-class district roads, connecting villages or forming branches of main or country roads	35 to 50
Second-class district roads, mostly country lanes	25 to 35

In regard to the standards of width set for country roads, it is observed that if these are thought to be in excess of the real requirements, it must be remembered that these districts may not remain rural in perpetuity. "In the neighbourhood of London, where districts, now rural, are either becoming urban in character, or are likely to become so in the near future, sufficient width should be reserved for the traffic which is certain to arise. Unless definite and timely steps are taken to secure land for widening while it can still be obtained at reasonable cost, the mischief which has arisen in the past is sure to recur, and will only be curable at great expense." This is no more than sound common sense, applicable, we may add, to city streets as well as to suburban roads. Much of the traffic difficulty within London arises from streets having been made, even in quite recent times (as in the case of Shaftesbury Avenue), too narrow to provide for the increased traffic of the future.

There is another important point touched upon in this portion of the Report. The standards of width given above are suggested by purely utilitarian considerations, but there is another aspect in which the approaches to London may be regarded. In foreign countries it is recognised that "the

main avenues of approach to a great city should be invested with some degree of dignity, and should be pleasant as well as useful to the thousands who traverse them." This is a point of view to which we are still almost entirely indifferent in England, and we are indebted to the framers of the Report for thus accentuating it. It is to be hoped that this æsthetic suggestion, coming as it does in a document which is mostly of a severely practical character, will not be without its effect.

We have reproduced, in a reduced form, Plate II., appended to the Report, showing the proposals that are made for new arterial roads for access to and exit from London. These roads which in the original map are shown in red, are distinguished here by strong dotted lines. They appear curiously irregular in line, but their course is no doubt affected by local peculiarities of ground and of property demarcations which cannot be indicated on the map. Even with this reservation, however, the title "North Circular Road" looks rather odd as

applied to the wriggling piece of road to which it is appended; but we presume the true bearing of the adjective "circular" is that this is not a road of approach, but a lateral connection between two different lines of approach. For the purpose of considering the improvements in arterial roads, the districts around London have been divided into six compartments—N.W., N., N.E., S.W., S., and S.E.; and these are considered and explained under so many separate headings in the Report. In the S.E. compartment the additions are mainly in the way of loop roads intended to relieve points where the traffic is at present congested and where there are narrow stretches of road which cannot now be easily widened. The principle adopted is illustrated in the sentence on what is called "the Eltham by-pass":—"Traffic through Eltham is not heavy in winter, but it is considerable in summer, when its volume is more than doubled. A by-pass, about two and a half miles in length, constructed to the south of Eltham,

DIAGRAM OF GREATER LONDON SHOWING THE EXISTING MAIN ROADS RADIATING OUT OF THE METROPOLIS, AND PROPOSED NEW ROADS (SHOWN BY HEAVY DOTTED LINES).

would shorten the distance by a quarter of a mile, avoid the village" (where it appears that the road becomes narrow and crooked), "save the ascent and descent of a hill 50 or 60 feet in height, and open up land well adapted for building." This latter point is, of course, of great importance in connection with building interests, and any assurance that the new roads marked on this map would be made within a reasonable period would probably be a considerable stimulus to the purchase and laying out of building land, besides raising the spirits of some owners (and we know that there are such) who have purchased land which they find that they cannot profitably develop for want of adequate road connection with London.

Of the larger features of the scheme, it will be noticed that these include a new Western Avenue and Eastern Avenue. The reasons given for the Western Avenue, too long to quote here, should be studied in the Report; we may only notice the remark that "the open ground to the south of Wormwood Scrubs, now occupied by exhibition buildings, comes nearer to the City than any other vacant space within the County of London, and presents an opportunity for forming a good western outlet which should on no account be lost." Another paragraph from this section of the Report, which has, however, a general application, we may as well quote in full:—

"Sites along the course of the Western Avenue, within easy reach of railway stations, would be well suited for the establishment of Garden Cities; and, wherever land could be acquired on favourable terms, many parts of such an approach to London might be made attractive if sufficient width were taken in to admit of tree planting on both sides. This might be done with advantage in the case of all new or improved roads; the suggestion is made here, because the Western Avenue would be especially suited for such treatment, and the extra expense would be comparatively small."

This also is a suggestion which we hope will not be lost sight of.

There is so much that is important in other details of the Report, in relation to the future of London, that we may return to it, after giving this general outline of its purport. In the meantime we may say that this Blue-book is a document which is well worth the serious attention of all who possess, or who may think of acquiring, building property along any of the new lines of road proposed on the map.

The Institute of Architects.

THE meeting of the Institute last week was the occasion of the reading of a remarkable paper by Mr. Waterhouse, embodying a boldly conceived scheme for ensuring a working system of architectural supervision over all London improvements. The paper, printed on another page, speaks for itself. It is to be regretted that so important a paper received no adequate discussion—practically, indeed, no discussion at all. This was in part owing to the practice, which seems to be on the increase at the Institute meetings, of putting up distinguished laymen who may have been invited to the meeting, to lead a discussion on professional topics which in general they do not understand. The result in this case was that the First Commissioner of Works and the Chairman of the London County Council, who were called on to speak, occupied a considerable time in complimentary platitudes which had no relation to the real subject of the paper; and the Clerk of the L.C.C., neglecting the fact that this was a paper entirely dealing with the possible architectural future of London, spoke of the mischief done by architects in destroying the relics of the past; a point which, whether true in any sense or not, had nothing to do with the paper that had been read, and was a statement singularly unsuitable to be made in the rooms of the Institute of Architects, which has actually incurred the odium of being considered intrusive and meddlesome on account of its repeated and persistent efforts to secure the preservation of any ancient building threatened with destruction. Even Professor Pite, who always speaks on architectural subjects with the eloquence of an enthusiast, missed the point of the paper,

which in fact was never discussed at all. It is to no purpose to say that we have a great many beautiful buildings in London. So we have; the point of the matter is that we do not know how to place them, and that the placing of new buildings and the laying out of roads in connection with them is in the hands of official authorities who do not understand the subject, and who require architectural guidance; which guidance Mr. Waterhouse proposed to create and systematise. To ask the very officials who require that guidance to get up and lecture to the architects is merely wasting time. They should be invited to the meetings to learn, and not to teach; certainly not to assume (perhaps very unwillingly) the part of leaders in an architectural discussion.

Responsibility for Dry Rot.

A RECENT legal decision, in which, as reported in the Journal, an architect was held responsible for the extensive ravages of dry rot in a large building, revives two important questions of professional responsibility. These may be discussed upon their broad issues with reference to the general principles involved, and independently of the particular case which happens to have brought them once more into prominence. In the first place, it is to be noted that the architect—not the architect in the case under notice, but the architect as an abstract entity—now appears to have good reason for withholding his final certificate for a longer period than the builder is disposed to think necessary. It is apparently prudent to await such developments as the growth of dry rot! Otherwise an architect, having granted his certificate, is in danger of being held responsible for the appearance of dry rot, the occurrence of which might have been prevented if his instructions had been properly carried out. It seems clear, moreover, that, judging from recent decisions, a clerk of works can only be held responsible for comparatively small matters of detail, and that for larger concerns, such as the construction of floors, and the prevention of dry rot in them, an architect is held to be directly and fully responsible. The second question arises as to the architect's and the builder's responsibility for the appearance of dry rot. On previous occasions we have contested the tacit or the explicit assumption that dry rot can be absolutely prevented by taking what are supposed to be effectual precautions. But the assumption seems to take too little account of the fact that dry rot is a very insidious disease, and, on the whole, a rather obscure one, since it has not yet been made the subject of a thoroughly exhaustive investigation. In the present state of knowledge, all that is humanly possible may be done to prevent it, and yet it may occur. In parallel circumstances, in the domain of medicine and surgery, a doctor would not be mulcted in heavy damages unless it could be proved that he had acted negligently or unskilfully. Similar justice should be meted out to the architect; but at present, the view seems to be that when the building owner suffers loss and damage in consequence of the ravages of dry rot, he ought, in any case, to be able to recover from the builder or from the architect. It is true that a medical man may, in certain circumstances, be made to smart for the consequences of failure to exhibit due professional skill and care, and it would be idle to contend for more leniency for the architect or the builder; but what we feel entitled to protest against is the disposition to assume that in every instance dry rot is preventable, and that therefore in every instance of its occurrence the architect or the builder should be held liable for the damage sustained by the building owner. Surely there are many circumstances of location, site, soil, surroundings, that are in a high degree favourable to the development and spread of the disease; and these points, for lack of ascertainment concerning them, are seldom or never brought before the courts, except in a diffident and tentative way. Of recent years, dry-rot cases have been so frequently the subject of litigation, and architects and builders have suffered so heavily in consequence, that, on

several occasions we have felt impelled to urge upon the R.I.B.A. the desirability of entering upon an exhaustive investigation of the subject in all its bearings. We take leave to reiterate the plea. Unless woodwork is placed upon a more equitable basis, architects will probably be inclined, in self-defence, to abandon its use as far as possible in favour of other materials which are at all events free from this peculiarly harassing disqualification of timber.

The "Majestic River" and the Projected Bridge.

AT the banquet given at the Guildhall last Wednesday night to the municipal representatives from Belgium, M. Armand Hubert, Belgian Minister of Industry and Labour, remarked, in responding to a toast, that what struck the visitor to London more than anything else "was the immense activity to be seen on all hands, and the magnificent view to be obtained on both sides of that majestic river the Thames. The splendour of the public buildings was most imposing." On such occasions the fine wine of graceful compliment is expected to flow with generous freedom. Nevertheless, there is always a choice of subjects; and M. Hubert's choice ought to impress the civic authorities who were his hosts with a keener sense of the responsibility that rests upon them to deserve this high praise. We are bound to believe that he was not speaking ironically with regard to the majesty of the Thames and the magnificence of the view on both its banks, although hitherto these splendours had escaped special notice; but we cannot altogether subdue a disturbing suspicion that perhaps he saw these things with a very friendly eye, and therefore rather as they might and should be than as they are. But the pertinent question is: How will the Corporation construe these unearned encomiums? With smug satisfaction in London as she is built, and a confirmed resolve to keep muddling along? Or will the City Fathers take to heart the more essential moral that it is laid on London's conscience to deserve such praise? The affair of the St. Paul's Bridge gives them a splendid opportunity of paying this debt of honour—or, on the other hand, of increasing it beyond redemption. Surely a "majestic" river deserves a majestic bridge.

"Good-enough" Schools.

IN the course of the debate on the Address in the House of Commons last week, Mr. Walter Runciman, President of the Board of Education, answering an attack on his Department, claimed that they not only were alive to the heavy cost of education, but had done something towards reducing it. "One of their troubles," he is reported as having said, "was to prevent local authorities from spending too much on buildings. All over the country there was a tendency, fostered by both builders and architects, and to some extent by members of local authorities, who were proud of fine public buildings, to put up schools that were far too costly. Although £20 a place was the standard in London, buildings just as good for the purpose were being put up at Croydon for £13 a place." As to the cheaper buildings being, as a rule, "just as good for the purpose," "I doubt it," said the Carpenter, and shed a bitter tear." Mr. J. M. Henderson, the Member for West Aberdeenshire, may or may not have been speaking ironically when he said, "They could not expect fine streets, parks, swimming baths, and the best sanitary arrangements, without paying for them," but at any rate the proposition is incontrovertible; and it is one of those truisms of which a timely reminder is occasionally very valuable. Without laying undue stress on Mr. Runciman's insinuation of interested motives on the part of architects and builders—although we cannot help thinking that the allusion was tactless and gratuitous—we feel impelled to protest against the implied encouragement of cheap schools, or cheap public buildings of any kind. The architectural interest in the matter is precisely that which Mr. Runciman attributed to the local authorities who are "proud of fine public build-

ings," and we fear that the spirit in which Mr. Runciman is approaching the subject is likely to be intensified into a meanness of view which may go very far beyond his own intention; with the deplorable result that poverty-stricken and ignoble schools will be multiplied throughout the country. It cannot be supposed that a responsible Minister holds the degrading view that any sort of "good-enough-for-the-purpose" building will do for a school; but that is how, in many instances, his pronouncement is likely to be interpreted; and it would be wise for him to take the first opportunity of modifying the mischievous impression that his utterances on the subject have undoubtedly created. The saving that is likely to be effected on skimmed and stinted, or "good-enough," school buildings, in which only the miserly could "take a pride," is so distinctly of the pennywise order that we have no hesitation in urging upon the Board of Education the plain duty of discountenancing instead of fostering such a niggardly, penurious policy, and of at once making their position on this point clear and unmistakable. At present the impression is that the Board of Education fosters cheese-paring. The declaration that "One of their troubles was to prevent local authorities from spending too much on buildings" will certainly convey that impression. It also suggests that some at least of the Board's troubles seem to be of their own creation, and do not greatly dignify their office.

Ancient History at the Royal Academy.

THE Dean of Gloucester, who is Honorary Professor of Ancient History in the Royal Academy, gave a lecture on Tuesday last week on "The Merovingian Abbey of St. Martin of Tours," which he described as "the model of the great churches of the Middle Ages." It is not the model of them any more than the Basilican type of church in general is; and considering that the church, along with a great part of the city of Tours, was destroyed by a fire in the year 999 and not a vestige of it is left, it is rather difficult to see how we can know how far it was a model. The lecturer said there were enough descriptions left practically to restore the church, but he certainly did not furnish us with anything precise enough to justify the restorations (by a French architect) which were shown on the screen; one very peculiar feature in the restored plan, the two internal perches blocking up both aisles near the west end, ought to have had some very precise documentary evidence to justify it, but none was forthcoming. A great deal of the history about the formulation of the church, and the persons connected with it, was interesting in itself, but hardly connected with the objects of the Royal Academy. In conclusion the Dean wandered from his special subject to make a rather eloquent plea for more colour in architecture, especially in reference to the glorious display of stained glass in the late choir of his own cathedral; but when he asked us to believe that the Norman nave was also originally a blaze of colour we are rather more sceptical. There may have been a certain amount of picking out, in colour, but it is doubtful if we should have liked it, could we have seen it. Butterfield carried out his idea of the colouring of a Norman interior at St. Cross; but the result, to say the least, is not happy.

Training and Efficiency.

MOVEMENT with the object of impressing the public with the great need for more systematic means of securing business efficiency has been for some time promoted by successive Lord Mayors of London, and is at length assuming definite shape. A conference, to be held immediately in London, under the presidency of the Lord Mayor, at which important resolutions will be proposed calling on the Government to establish a national system of industrial, professional, and commercial training, to which children shall pass as a matter of course, and without interval, for a definite period, in order that they may receive efficient preliminary training for the particular calling for which they seem best

HOUSE AT FARNHAM, SURREY HAROLD FALKNER, ARCHITECT.

fitted, such training to be under fully qualified instructors, and the cost to be borne by the National Exchequer. In view of the immense advantages which Germany has reaped from a similar system, the large outlay that is likely to be involved should be thoroughly justified. That the great building industry would welcome some thorough system of training is evident from the constant complaints of architects, employers, and workmen that craftsmanship is decaying, that machine methods are killing artistic feeling and robbing the workman's occupation of its former interest, that the modern competitive system is rendering employment so irregular, and tending so constantly to throw the older workmen out of employment, that men are no longer able to put their hearts into their work. A well-conceived national system of training would remedy some of the trouble by keeping out the least fit and raising the skill and competence of those admitted. Incidentally such of those elder men as are the depositaries of invaluable experience could be employed as instructors, and in many ways pride in craftsmanship would be revived and

fostered. Most practical men, however, are convinced that technical schooling alone, no matter how thoroughly it may be conceived and conducted, must always fall far short of the ultimate object of producing the complete craftsman. It must be supplemented by training in the office, on the works, and in the shops. Therefore, the promoters of the movement have been wise in enlisting the aid of accredited representatives of the various industries—in other words, of asking the men who know; and we understand that in this respect the architects and builders have not been overlooked.

A College of Mediæval Art.

Some years ago, when the scheme for opening a new street from Pavement to Piccadilly, York, was initiated, Mr. Frank Green purchased the historic house, Treasurer's House, which was doomed to be removed to clear the way for the new thoroughfare. Mr. Green had every part of the building carefully taken down and numbered, and removed to a vacant

HOUSE AT FARNHAM. HAROLD FALKNER, ARCHITECT.

The two houses at Farnham here illustrated are interesting as examples of work carried out strictly with a view to economy, and in harmony with the requirements of an average household, yet possessing architectural character, more particularly the house illustrated on the preceding page. Mr. Harold Falkner, of Farnham, was the architect.

piece of ground near the east end of the Minster, opposite St. William's College. The original intention was to re-erect the house on the site referred to, but for various reasons this has not been carried out, the chief one being that it is desired to leave the vicinity of the Minster and St. William's College free from anything that would obstruct the view from every point. A new suggestion has now been made for the disposal of the fabric of Treasurer's House. At the annual meeting of the Yorkshire Philosophical Society last week, it was stated that Mr. Frank Green was willing to hand over the material (which cost about £1,000) to the Society for re-erection in the grounds for use as a mediæval museum, in connection with Professor Stoughton Holbourn's scheme for a College of Mediæval Art for York. Not only would Mr. Green hand over all the material, but he would also be prepared to contribute £500 towards the cost of re-erection. Dr. Tempest Anderson said in order to carry out the proposal properly another £1,000 would be required. If they got that they would proceed with the re-erection of the house probably near the Bowling Green. It would form the nucleus of Professor Holbourn's scheme.

Royal Institution Lectures.

MR. JACKSON'S second lecture, on Saturday last, dealt with the Italian Byzantine school of architecture, as illustrated mainly at Ravenna, and with Italian and German Romanesque. The first-mentioned school included the gradual adoption of the Byzantine style of detail in combination with the basilica plan, as at Parenzo, a basilica church with completely Byzantine detail. The conquest of Italy by Justinian led to the erection of San Vitale at Ravenna on a Byzantine plan, with a strong resemblance to the church of SS. Sergius and Bacchus at Constantinople. On these churches of the Byzantine type the decoration was mostly in mosaic; little use was made of sculpture, and little of the human figure, the designs consisting more of decorative patterns, in which, however, birds and vine leafage were often interwoven. Venice being the only Italian city which adhered to the Eastern Empire

after the fall of the Exarchate, St. Mark's was purely a Byzantine church. The beginning of the Romanesque and the decline of Byzantine influence was apparent in the less decorated round-arched style of such churches as those of Pisa, Lucca, Pavia, and S. Ambrogio at Milan. Along with this architecture the campanile in connection with the church became an occasional feature, and it was pointed out what a very important effect the presence or absence of church towers had upon the architectural aspect of a city. The galleried apse of the German and some of the Italian Romanesque churches was mentioned and illustrated as a characteristic and charming feature of the style. Special mention was made of Charlemagne's church at Aix-la-Chapelle, as a design obviously based on that of San Vitale, though superior constructively in the manner in which the aisle vaulting is contrived to distribute the thrust of the centre dome on the outer walls. In conclusion, Mr. Jackson urged on his audience the necessity, if they would understand the development of architectural style, of looking to the structural problems which underlie the merely superficial aspect of buildings. The Latin basilica churches with timber roofs, for instance, were easy to construct, but as soon as the attempt was made to build a solid roofing, either in the form of a dome or a vault, there began a fight with difficulties of construction, out of which developed a new style; for architectural style arose out of construction, and not out of any mere caprice in the taste of the builders. To architects, of course, this is (or should be) a truism, but it is a point which cannot be too often impressed on general audiences, the general public being still apt to regard architecture only from the outside, and to imagine that changes of style were a mere matter of taste. It is a great pity that there have not been larger audiences to profit by these very instructive lectures on a peculiarly interesting field of architectural history; the attendance was, indeed, quite as good as it generally is at the Royal Institution afternoon lectures; but that is not saying much. The concluding lecture, on "Romanesque in France and England," will be given next Saturday.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

"Civitas" and the Soane Award.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—The occasion of the withholding of the Soane Award has caused so much comment by, and so many enquiries from, personal friends, and the young men of architectural profession, that some explanation seems to be called for.

The President and Council claim that I received "substantial" help, and I have freely acknowledged that I did receive some help in colouring, and also in the setting up of a rough draft from my own sketches for the perspective, the latter being work which I considered was of a purely mechanical nature. The responsibility, therefore, for the withholding of the Soane, is entirely my own, and I wish to take all blame. I have lost a much coveted prize, but I am still very young.

In any case, the loss of the Soane is not the bitter disappointment to me that it might have been to some, for my competing at all was a mere chance accident I was already a student in Paris when the programme was issued, and it occurred to me that I might as well work upon this project as any other. Moreover, when I read the programme I realised that the award would probably go to the man who could convert a civic ditch of 120 feet into a dignified water approach, for only thus could the scale be obtained which could in any case express the status of a capital city. I thought when I had solved this problem that I would probably be well in the running.

Now, as to the help I received. The fact that I prepared my early studies during the summer vacation absolutely precludes any question as to the authorship of the design, so the whole objection naturally revolves upon that of draughtsmanship, and here I may further add that I did not receive any assistance whatever until the Thursday preceding the Wednesday, the day of sending in. This shows that I did not even anticipate any help. At this stage all the drawings were in line, and I have the assurance of responsible authorities that had I sent in my drawings at this stage I should still have been the winner. Had I for one moment anticipated that so much value was placed on gilt and Chinese white I would have washed out every trace of it.

Only on one point do I offer any criticism of the Council's action, and this for awarding me the Soane in face of the help rendered by my friend M. Carlu, whose every touch is unmistakable, and was unquestionably recognised by Professor Reilly, who delivered the criticism. Speaking for myself, it certainly never occurred to me that the snow on the perspective (mostly put on with a tooth-brush), the amusing political meeting on the side façade, or the smoke, so cleverly indicated above the plan, of the steamer (whilst undeniably adding interest to the drawings) would be classed as architecture, and I am certain that it will vastly amuse my fellow students at the atelier that the R.I.B.A. attach so much importance to the merely "chic," and equally surprise them that so little encouragement is given to the more important qualities of imagination and true architectural scholarship, which are surely the only guarantees of a student's future.

PRENTICE MAWSON.

London Bridge Improvement.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—As a lover of London and one who has for twenty years passed almost daily over London Bridge, I have read with pleasure the announcement that a scheme for improving the approach into the City from London Bridge is likely to be carried out. The outline you give is very promising as to the general effect of this long-needed improvement, particularly as to the design of the building facing the beautiful hall of the Fishmongers' Company. It is to be hoped that the character of any new buildings to take the place of those facing the bridge (i.e., behind the statue of King William) will be duly considered.

There is one point, however, which I would very respectfully question, and that is the suggestion of arcades over the footways. I venture to think this would be a mistake, as such an arrangement

would completely shut out the view which pedestrians would otherwise obtain of what should be a very noble vista.

S. S. BRYANT.

London, E.C.

Stresses in Angle-Cleat Rivets.

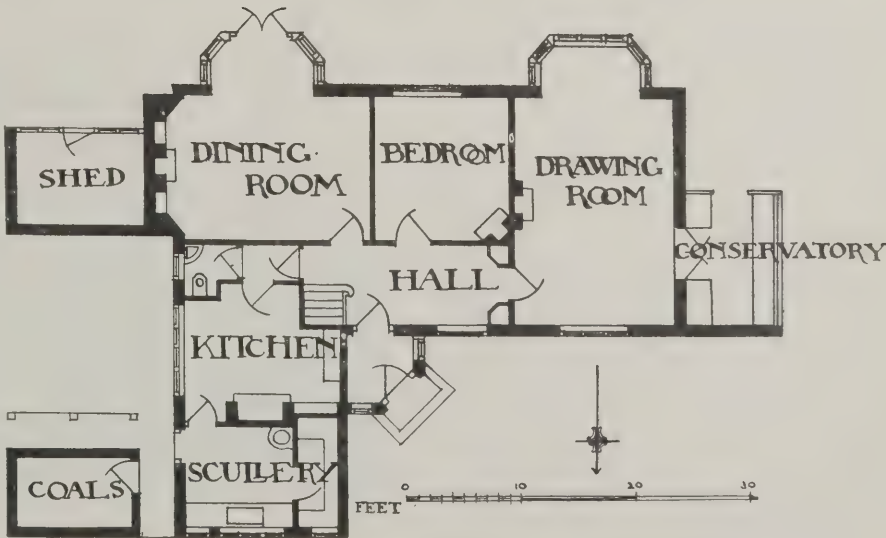

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—With reference to the article in your issue of February 1st, on "Stresses in Angle-Cleat Rivets," by Mr. Ewart Andrews, I note that the load P transmitted from plate B to plate A would act through one corner of the plate (viz., at P). This would, of course, be the case if the plate were resting on this corner, but in a cleat the other leg or flange is always bolted to the supporting plate.

Now it is evident that plate B can be connected to plate A by a single rivet, which would carry the specified load providing the diameter be big enough, and that in this case the cleat will act as a cantilever, and the bending moment will be taken up by the bolts on flange of cleat, and that the one rivet will be in simple shear. This will also apply to the case where several rivets are used.

Entrance Front.

Ground-floor Plan.

HOUSE AT FARNHAM. HAROLD FALKNER, ARCHITECT.

Using the same notation as in the article, the sketch here shows how the cleat would be in practice.

Let I = moment of inertia of bolts about axis o .

f = safe tensile stress per sq. inch on bolts.

y = distance of outside edge of bolts furthest from o .

Then taking the cleat as a cantilever we get

$$\frac{fI}{y} = Px$$

if $\frac{fI}{y}$ is greater than Px the rivets 1, 2, 3, 4, 5, will be in simple shear.

Supposing $\frac{fI}{y}$ is less than Px , then we have Px

$$\Sigma kar^2 = \Gamma x - \frac{fI}{y}$$

In the particular instance of the cleat from Dorman Long's book mentioned in the article there are four $\frac{3}{4}$ diameter bolts up the flange. The moment of resistance of these about P is about 55, and Px only 19.7, so that if plate B had one large rivet in place of the five shown, the joint would be quite safe, and the only stresses on the rivets would be direct shear.

R. GILLET.

[I am not quite sure that I follow Mr. Gillett's objection to the treatment given in my article. If, however, he suggests that, because the rivets might be replaced by one rivet if big enough, there will be no eccentric stresses on the rivets, then I think he is in error. My treatment does not assume, as suggested in the letter, that the force acts through one corner of the plate. I take it as acting along the edge of the cleat as it should be. The question of the tensile stresses in the bolts is a separate problem, which does not affect the shear stresses in the rivets. As a simple illustration that there must be eccentric stress in the rivets, it will be noted that with only one rivet the cleat would theoretically turn freely on the beam; but with more than one rivet this turning would be prevented, and additional stresses would thus be induced.—EWART S. ANDREWS.]

Hedge and Ditch Dividing Properties.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In a recent issue of the "Architect's and Builders' Journal," one of your correspondents asked for information as to the usual allowance for the ditch to a hedge dividing properties of different owners.

The practice varies in different parts of the country. In the north the allowance is five quarters, a quarter being 9 in., and it is measured from the centre line of the hedge. Other local allowances are six links from the centre of hedge and four feet. These of course are the same to $\frac{1}{2}$ in.

So far as the writer is aware, there are no recent rulings of court on the subject, and as the land containing the ditch is not available in the ordinary way, except in the case of building development, the matter of an inch or two is not of great importance, the local custom being agreed to in practically all cases.

WILFRID WISE, B.Sc.Lond. (Eng.).
Durham.

THE SPRING CLEANING SUPERSTITION.

Attention is once again being called to the inconvenience and suffering that are caused by the "spring-cleaning" mania. Mr. Munford, chairman of the Paddington Distress Committee, states that in his district there are at present about 3,400 painters unemployed, and the bitter irony of the situation is that in about two months' time many of these men will have probably to work 12 or 15 hours a day to meet the sudden rush. He urges that if householders would have a certain amount of their internal decorations carried out now, even at a little discomfort to themselves, it would relieve a great deal of the unnecessary distress now prevailing. This well-meant appeal, however, is likely to have less effect than the present indications of an early spring; for the cult of gregarious spring cleaning is a sort of deeply rooted pagan superstition, or revered religious ritual, and those who are under its spell seem to be quite impervious to reason. There are, however, it must be in fairness acknowledged, some quite practical objections to beginning much earlier than is at present customary. There is, for instance, the fear that if the cleaning and decoration are done before the winter is well away, the work may suffer from the grime and slush of which that season is so prolific; and then the discomforts of "having the painters in" are greatly intensified when the temperature is low, and the days begin late and end early. There is, however, much work to which none of these objections apply with equal force, and this is often quite unnecessarily postponed until the "painting season," mainly because the lay mind is obsessed by a vague but ineradicable notion that that is when it ought to be done.

THE ST. GEORGE'S HALL CONTROVERSY.

The Liverpool King Edward Memorial Committee met on February 14th to consider the recommendation of the Finance Committee with regard to the site for the proposed statue. The Finance Committee suggested that, instead of placing the statue in a central position in front of the southern portion of St. George's Hall, in accordance with Mr. Norman Shaw's design, there should be two sites, and that the equestrian statue of King Edward should be put on the site nearer Lime Street. The Memorial Committee decided to take the opinion of the experts on the proposed variation of Mr. Norman Shaw's design.

It is believed that this proposition will be acceptable to all except a few uncompromising sticklers for "the wall, the whole wall, and nothing but the wall." Mr. Lionel B. Budden, one of the most trustworthy of the many writers upon this subject in the Liverpool Press, thought it 'practically certain that all serious opposition would be withdrawn' if the Memorial Committee agreed to adopt the suggestion of placing two balancing equestrian statues, one at either end of the podium; but he adds that 'the retention of the oblique steps would, of course, constitute an insuperable barrier to any thought of compromise,' pointing out that 'these steps, without the central group which supplied their *raison d'être*, are more irrelevant . . . than those in Mr. Shaw's scheme, which were cloaked to some extent by the statue.'

Mr. Budden, in an article on the subject in the issue of the "Architectural Review" for November last, deemed it probable that the question of providing means of access to the south portico had from the first proved one of Elmes's most serious difficulties; but at the time of his death, in 1847, nothing definite had been determined. A print published in 1853, and here reproduced, is of special interest as showing two equestrian statues in positions presuming an arrangement that is almost identical with that which is now proposed as a final solution of the problem.

The approach shown to the south portico is possibly a conjectural completion of the work in progress at the time. This print has evidently inspired the present proposal to place an equestrian statue at each end of the podium.

PRINT PUBLISHED IN 1853 COMMEMORATING THE OPENING OF ST. GEORGE'S HALL, LIVERPOOL.

THE LIGHTING OF PUBLIC LIBRARIES.

The artificial lighting of public libraries was the subject dealt with at last month's meeting of the Illuminating Engineering Society. Three papers were read—by Mr. J. Duff Brown, borough librarian, Islington; Mr. L. Stanley Jast, chief librarian of the Croydon Public Libraries; and Mr. John Darch, F.S.I.

Mr. Duff Brown, in the course of his remarks, said, with reference to newspaper stands or slopes, that if the lighting for each were arranged independently it meant that the fittings became fixtures, a disadvantage always associated with wiring which had to be conveyed along the floor and attached to tables or stands. For this reason his own preference was in favour of having the lights hanging from the ceiling independently of furniture, so as to obtain complete adjustability whenever required. "There is hardly any library in existence which has not at some time rearranged its fittings and furniture, and it is often difficult to make alterations without overhauling the whole of the lighting apparatus."

Mr. Stanley Jast, while not questioning the undesirability of point lighting, said that in most reference libraries it was a necessary evil in connection with the reading-tables. "The question then arises as to whether suspended lights over, or standards on, the tables are to be preferred. If a standard is chosen, what is the best height above the table, what is the best design of standard, and, more important still, what is the best form of shade? The only scientifically constructed shade is, I presume, the Holophane; my objection to it for table-lamps is that you have a bright light immediately above the eyes, not, of course, so accentuated as in the case of the unshaded lamp, but sufficiently annoying, nevertheless. After trying myself several varieties of shade, I prefer, on the whole, the ordinary cone-shaped opal shade, as deep as it is possible to get it, so that the reader seated at the table is unable in an ordinary position to see any part of the lamp itself."

Turning to the problem of lighting gangways between bookcases, Mr. Jast said this meant lighting an average width of from 3 ft. to 4 ft., and at the same time lighting two vertical walls of books, covering an average width of, say, 9 ft. 6 in. to 10 ft., with an average height from the floor of about 8 ft. "I do not remember to have seen an absolutely satisfactory solution of this problem, and I am inclined to doubt if such a solution is possible. But I have a suggestion to make, which seems to promise better results than any yet attained. The difficulty is to light the lower half of the case properly. My idea is to do this from below, as one lights the lower half of a stage by footlights. I would cut a longitudinal trough in the floor, parallel to and at a suitable distance from the case, cover it with glass of the necessary thickness, and in this trough I would place lamps, with reflectors so arranged that the light would be thrown directly on to the case (see Fig. 1). Or instead of the trough, the lamps might be hidden in the step which is found in some libraries at the bottom of the case. I illustrate this arrangement in Fig. 2, with an alternative of lighting the upper part of the case by Tubolite in place of the centre drop."

Mr. John Darch said the worst general lighting in libraries was that which was most common, namely, the placing of plain opal shade pendants at equal distances apart, and about 8 ft. 6 in. from the floor. By this arrangement the ceiling and upper

half of the walls were in gloom, yet the glare of the lights was experienced in every part of the room. Mr. Darch disapproved of downward or other reflectors in general lighting, and said that a room was better lit when ceilings and walls were used to reflect the light. For low ceilings the lamps should be shielded by opaque or semi-opaque screens of the form shown by Fig. 3, by means of which a good general illumination could be secured without the lights being seen.

With regard to reading-desks and tables, Mr. Darch emphasised the importance of having a separate light with a shade for every reader, and expressed the opinion that such lights should be adjustable and under the control of the reader, so that each person might suit his own desires or needs as to the position of the light; readers, too, should be left to switch off their own lights, which was a system of economy, and not one likely to cause an extra expenditure. By contrast Mr. Darch said: "I have been in the South Kensington Library when every light has been going with scarcely a reader; I have seen nearly all the Patent Office tables empty; I have seen but five readers in both reference library and newsroom of the Guildhall; yet in each case all the lights were on, as though they were being used. Is this economy? If, on the other hand, my proposal were adopted, the reader would walk into a quietly lit room, select his table and switch on the light, which would be concentrated on his book. When he left his desk he would, as a matter of ordinary good behaviour, switch off his light; but should anyone fail to do so, the assistants could easily remedy the omission. All this implies that each reader should have an apportioned space or desk. It is done at the British Museum with a width of

4 ft. 3 in., but 3 ft. 6 in. should be ample for simple reading.

"With regard to news stands, the rule appears to be to distribute plain pendants throughout the room, regardless of the positions of the stands or desks, and, consequently, the amount of light in foot-candles reaching the newspaper is often ridiculously small. At the Guildhall and at other libraries the reader is able to admire the form of his own shadow in front of him, and has to read through the gloom of it. At Wandsworth, Kensington, and many other places a lamp is suspended directly over the stand—the very worst position—for by reason of the extremely oblique direction of the rays the illumination is very small, and reading is rendered still more difficult in consequence of the puckering of the paper. The accompanying sketch (Fig. 4) illustrates this. A is a 30 c.p. lamp, the downward radiation of which is, however, only 18 c.p. The lamp is 3 ft. from the centre of the desk at B, and the angle of incidence ABC is 10 deg.; therefore the illumination of the slope is $\frac{18 \sin a}{3^2} = 0.34$ foot-candle. What a

miserable result from a 30 c.p. lamp, and what a waste of light!

"The best arrangement I have seen is at Cripplegate. The newspaper stands are 8 ft. long (for two newspapers on each side), and 2 ft. from the end of each—that is, in the centre of each newspaper—is a bracket lamp at about the level of the top of the stand, and projecting 15 in. (see Fig. 5). A light of about $3\frac{1}{2}$ foot-candles is thereby obtained from only an 8 c.p. lamp. Here you have a splendid light for a small expenditure of current, and independent of the crumpled paper. The lamps, however, are painfully visible whichever way you turn—a defect which might easily be corrected by having deeper shades and directing them towards the newspapers as shown by Fig. 6."

ARCHITECT'S CLAIM FOR BREACH OF AGREEMENT.

An action was tried before his Honour Judge Ruegg at the Birmingham County Court last week in which Mr. J. J. Hackett, architect, of Birmingham, sued Mr. G. Hiorns, of Ward End, for damages for breach of contract.

It appeared from the evidence that in 1907 the Birmingham Corporation were in negotiation with the various property owners for acquiring various strips of land on either side of St. Margaret's road, Ward End, for the purpose of widening same. Prior to being approached by the defendant, the plaintiff had already negotiated for two property owners for the frontage of about 300 yards extent, and in each case the fees due to him for such negotiations had been paid by the Corporation. The defendant appears to have been particularly anxious that under no circumstances should he be liable for any fees, and to this the plaintiff assented, the only stipulation being that if the matter was carried through he should carry out the negotiations and other work incidental thereto, and be allowed the opportunity of obtaining his fees from the Corporation. Plaintiff accordingly prepared plans, which were amended from time to time to conform to the requirements of the defendant, and ultimately prepared working drawings of what was required. The matter was then shelved for a time owing to the adjoining owner declining to relinquish a portion of his land for the purposes of road widening, but was re-opened in the early part of 1910. The defendant then, however, instead of engaging the plaintiff to complete the negotiations, instructed a builder to get out plans and estimates, and these were ultimately accepted and the scheme carried through on same. The plaintiff gave evidence at length and was supported by Mr. J. Coulson Nicol, A.R.I.B.A., of Colmore Row, as to the value of the work done. Mr. Lee, the building surveyor, also

gave evidence as to the interviews with plaintiff. For the defendant it was contended that it was expressly stipulated by the terms of the contract that defendant was not to be liable to pay plaintiff, who was to look to the corporation for payment; also that the negotiations of plaintiff went off, and that it was a new scheme opened in 1910 which was ultimately carried through.—His Honour, in giving judgment for the plaintiff for £20, held that defendant, in instructing other agents to complete the negotiations, had broken the agreement, and prevented plaintiff receiving payment from the corporation for his services; also that the negotiations of 1907 were merely shelved and reopened in 1910.

LONDON MASTER BUILDERS' ASSOCIATION.

The usual monthly meeting of the Council of this Association was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, February 16th, under the chairmanship of Mr. Leonard Horner (President).

The audited accounts for 1910 were received from the Finance Committee, and will be submitted to the general meeting on Monday, February 27th.

The Organisation Committee's report was received, and although the matter is proceeding slowly, those districts that have been taken in hand have produced good results, and many builders have become members. It is now hoped to proceed with the work of organisation must faster.

It was decided to supply copies of the "Architects' and Builders' Journal" to the ordinary members at the expense of the Association.

Members were reminded that the annual dinner will take place on February 23rd, at the Hotel Metropole.

Other matters of interest were discussed.

THOS. COSTIGAN, Secretary.

SCHOOL BUILDING IN LONDON.

The Education Committee of the London County Council have prepared their estimates for the year ending March 31st, 1912, next, from which it appears that the following sums will be spent on capital account for new buildings:—

<i>Elementary Education.</i>	
Provision of new schools	£150,000
Additions and alterations to schools	120,000
Modernising and improving schools	88,650
New day schools for the blind, deaf, and defective	40,000
Alterations to schools for blind, deaf and defective	10,000
Industrial schools	10,540
Total	£419,190

<i>Higher Education.</i>	
New secondary schools	£68,050
Training colleges	12,000
Technical institutes and schools of art	69,000
Grants in aid of sites, buildings and equipment	27,395
Total	£176,445

<i>General.</i>	
Buildings, divisional offices	£ 640
General provision of sites and buildings	50,000
Sites to be acquired for new buildings under provisional order (if confirmed)	80,000
Buildings for places of detention	3,400
Total	£134,040

The aggregate total is £729,675. The provision for new elementary schools is £54,715 less than that for the current year, but the estimate for building enlargements is £32,820 more.

The average cost of a new elementary school place is usually put approximately at £30, i.e., £10 for site, and £20 for building and equipment. The estimates are, however, framed on the estimated cost of each individual site or building included therein. With regard to the buildings, the cost of building the 8,650 places has been estimated at £23 3s. 7d. a place. In connection with this figure, however, it has to be remembered that 6 out of the 16 proposals involved are "central" schools, and that in other cases the estimated cost includes the cost of domestic economy and other centres to be erected on the same site as the new school. The average cost per place of the six schools where none of these complications arise is £20 1s. 11d.

OUR PLATE.

The Harrogate Public Library, erected from the design by Mr. Henry T. Hare, forms part of a scheme of municipal buildings which yet remain to be built. The library is faced with York sandstone, and fireproof floors are fitted throughout. The heating is by low-pressure hot water, and the joinery and fittings are of wainscoat. The library is conducted on the open access principle.

We learn that Mr. Mervyn E. Macartney, B.A., F.S.A., F.R.I.B.A., architect to the Dean and Chapter of St. Paul's Cathedral, has been appointed to a similar position in connection with Durham Cathedral, in succession to the late Mr. C. Hodgson Fowler.

PUBLIC LIBRARY, HARROGATE [HENRY T. HARE, F.R.I.B.A., ARCHITECT.

MORDEN COLLEGE CHAPEL.

Morden College, Blackheath, founded by Sir John Morden, was built in the year 1695, and is a quiet and dignified example

in axial line with which, on the other side of the quadrangle, is the chapel, the entrance to which is characteristic of Wren almost at his best. A pair of fine doors of carved and panelled oak are set within

Grinling Gibbons. The proportions and details of the pulpit reveal Wren in his most masterly mood. The panels are of matched cross-grain, with wainscot inlay, one of them being decorated with the

THE CHAPEL OF MORDEN COLLEGE, BLACKHEATH, LONDON, S.E.

of Wren's work. The building is in the form of a square, colonnaded towards the quadrangle. The entrance is gained through a centrally placed doorway forming part of a pedimented central feature,

carved architraves, pilasters, and a pedimented head of fine detail, composition, and workmanship. Inside the chapel, the fittings are of panelled oak, and over the altar there is some interesting carving by

founder's monogram. The barrel-shaped ceiling of the chapel is plastered, and a gallery at the western end contains the organ; the whole interior conveying an instant impression of serene dignity.

THE ARCHITECTURAL DEVELOPMENT OF
LONDON.

BY E. A. RICKARDS, F.R.I.B.A. AND PAUL WATERHOUSE, M.A., F.R.I.B.A.,

At the meeting of the Royal Institute of British Architects held on February 13th, Mr. E. A. Rickards and Mr. Paul Waterhouse, in their respective papers, handled a common subject in characteristically varied styles; the former being rather destructively critical, while the latter detailed a rather elaborate constructive policy.

By E. A. Rickards, F.R.I.B.A.

MR. RICKARDS contended that if London is at any time to affect the large manner of the Continental and American city, she has little as a basis to work upon; certainly no centre of interest such as the buildings and gardens of the Louvre and the avenue leading from them. Such chances have consistently been lost sight of or ignored from Wren onward. There is abundant evidence that we have never cared for development in the literal sense of the word. The jealous way in which the very large amount of open space in London has been guarded is a large part of the proof. That these spaces should be put in some sort of order and even be rendered available for traffic does not necessarily entail any loss of area or any encroachment in a tangible way on such preserves. This is a superstition which will have to be mastered if we are ever to create any considerable spheres of influence and character in our new city, any effect of space through which a motive may be repeated and developed in all its possibilities of form and suggested harmonies. We allow no hands to be laid on the enclosed squares which could be so exploited in certain neighbourhoods such as Bloomsbury and Kensington, yet the whole artistic character and general design of the surrounding buildings is set back and in many cases eternally ruined by exotic material in the worst design. Even in the neighbourhoods of the most marked character and charm, which bear the stamp of a real and definite period, such as portions of Mayfair, the exotic design of the Flemish gable and other vagaries are evidence of a total lack of evolution from a very beautiful motive left us by the eighteenth century. The existence of so many accomplished American designs openly derived from the suggestions of this period testifies to the possibilities we have let slip in developing these districts of London in a manner entirely harmonious with the character so definitely imprinted on them, and yet imparting a very modern feeling in the result. I believe the Bloomsbury streets and squares are quite a field of study for the Americans, and many a beautiful piece of treillage ironwork and refined piece of design or doorway has its influence in the modern city architecture of America.

Then, again, we lay down restrictions in the material to be used in certain new streets: no other material than stone to be used for the elevation of business premises, for example, while some of our largest public buildings are being erected with such a material as red brick largely introduced and cutting up the façades. In new avenues that have been laid out in which it has been possible to allow of a certain direction if not an absolute vista, gable fronts are allowed which break all continuity of design and any feeling of coherence which decided horizontality in the character of the buildings would have ensured.

As an example from which much might be developed and acted upon in the treatment of many of our avenues, let us take Pall Mall, perhaps the most beautiful street in London, by reason, not of its uniformity,

but of its harmony of design and the subordinate interest of its individual buildings. Double the scale of operations and you have Oxford Street with its emporiums in place of clubs, capable of just as solid and artistic an expression of their purpose. We have some evidence already of this, with the strongly marked horizontal lines of the several new blocks lately erected and the happy abstention from the angle entrance. I would go further in my development of the theme given out in Pall Mall, and take the motive of the successions of lamps and braziers which line the areas to the clubs. These are all very evident on an evening of celebration such as the festival of the King's Birthday, and line the vista of the street in the most beautiful way. Imagine the avenues of mammoth stores with handsome standards of regular height, but in character corresponding to the building opposite which they are placed. Lombard Street, with its signs and again strongly marked horizontal features, though of very different proportions, is another example. London has many other motives that might be developed, and even the three or four generations immediately behind us are not without ideas of general forms and balance that are not strained in effect. Witness Regent Street and its continuations and the beautiful relation to the scale of life about it. Our own times have been responsible for breaking the continuity of design in many districts, and before being in a hurry to graft exotic treatment of obviously foreign design upon them it would be well for us to consider whether those were possible developments of the traditions and character in many places still so strongly in evidence. I should like to feel that there was any possibility of the designs of our new streets developing along the lines of a more comprehensive simplicity, with the tradesman's appeal confined more to the level of the public rather than displayed to the elements.

The scale of London which has taken so many centuries to evolve will always be with us, and if we can possibly give an effect of order in the many improvements of our time we shall be developing in a much freer manner than by these Continental schemes in miniature. A feeling of order, I repeat, is the most we can hope to attain to, and this, combined with interesting detail, would eventually result in a beauty which would be London's own. I am convinced that a development of possibilities as far as London is concerned, sufficient to result in a sense of order rather than symmetry, is the real keynote of our progress.

The Means to the End. By Paul Waterhouse, M.A., F.R.I.B.A.

By "artistic development" Mr. Waterhouse understood in the main the architectural development. How, if London has to be developed, shall we manage to conduct this development on true architectural lines; how shall we get the best artistic result? Cities beautiful owe their beauty to their streets and their houses. The streets may be beautiful by accident and irregularity or by deliberate street design. The houses of these streets may be beautiful individually or collectively. Our London contains—I hope always will contain—

beauty of all these four kinds: two classes of streets and two of houses. But it is clear that some artistic sense should ever be watchfully controlling these four elements of beauty.

No old street that owes its beauty to collective symmetry or to regularity of grouping should have that symmetry or regularity disturbed by the lack of some authoritative voice of control. Similarly no street whose charm is the random accumulation of irregular façades in irregular lines should have the charm of those elements violated by the intrusion of incongruous units nor even by a thoughtless introduction of undue regularity. But, conversely, there are places in which obviously the removal of chaos in favour of symmetry would be of great artistic value—places where a wise control of a group of buildings would make for greater beauty than could result from a series of contiguous individualities. And this brings us to the question of individual house design, the system under which most of our London architecture is produced. Can we truly say that throughout the important streets of central London there is at present any power at work which makes impossible the erection of buildings by incompetent designers? Is it not clear that there are many sites of great artistic importance which from time to time become occupied by buildings which would never have got carried into execution if there had been even a mild censorship exercised over the whims or the weakness of the designer?

Three self-evident axioms were: (1) That the preservation of London's past and the guidance of London's future are an artistic trust of the greatest importance. (2) At it is not merely an archaeological trust but an artistic one, the necessary guidance of the action of the trustees should be sought, not from committees or societies, but from individuals. Art is produced by individual artists, not by corporations. (3) And the third proposition is that the proper advisers are architects.

The present age in England is exceptionally strong in the numbers and quality of architects. Any architect who has had experience, as assessor in open competitions, of the wealth, the profusion of design which comes pouring in from all parts of the kingdom can testify to this. So can anyone who has looked through the really splendid and truly academic work submitted for our Institute prizes and sent in among the Testimonies required for our examinations. The best level is a really high one, and the numbers are great. There are, of course, weak men, ignorant men, and uneducated men among our ranks, but no thoughtful and observant student of modern English architecture can possibly deny that in numbers and merit the British architectural world of today is strong.

Against that wealth we have to set the indisputable fact that as far as London is concerned, great enterprises of vast importance are sometimes undertaken without any architectural advice whatever; that architectural advice when offered by the Institute in a corporate way and in a friendly spirit is often ungraciously declined; and finally that, much as individual owners may do on individual sites to secure good architectural effect in isolated instances by the engagement of first-rate architects, there is a conspicuous lack of general architectural control over these larger issues which are really of major importance. There is no good reason for this state of things, and no excuse. Construction as ruled by the Building Acts is admirably censored and

DETAIL OF REREDOS IN MORDEN COLLEGE CHAPEL.

controlled by our excellent system of district surveyors. Sanitation is also rigorously and vigorously regulated by the surveyors of the various borough councils. But the art of London building passes almost free of public control and stimulus. Why should this be?

The problem was not whether more artistic control is required, for that is a certainty; not whether architectural talent is available for such control, for that also is a certainty, nor is the question what would Mr. A, or Mr. B, or Sir XYZ, the leaders of our craft, make of the London problem if they were in charge of it, for that is a mere hypothesis. The problem was this: How are Messrs. A, B, and Sir XYZ to be brought within striking range of the work which so obviously lies waiting for them? The London problem lacks efficient artistic advice, efficient artistic control. London, which wisely and cheerfully spends many thousands a year on its regulation of good building and good sanitation, cannot possibly grudge the

comparatively trifling expense of good architectural direction. And if there were any body of artists other than architects to whom the duty could possibly pertain we should, I am sure, frankly say so. There is, there can be, no possible doubt but that what is needed is the employment by London for London of the very highest architectural advice in those problems of collective architecture which are, if people would only believe it, greater, not less, than the task of designing individual buildings for individual sites.

And now comes the crucial question. By what machinery can such a result be brought about? Would it be practicable to appoint an architect who should have supreme advisory control over all street-planning schemes and all questions of the guardianship of existing architectural monuments? Yes and no. That there should be a man who is architecturally supreme is, I believe, not a wild dream, but a practicable and very desirable solution of our difficulty. But no one man

could do all the work that needs to be done, and no committee of men can, as we have agreed before, effect work which can be styled work of art. How, then, are we to get individual artistic genius applied to the whole of this great acreage of buildings? His suggestion was that it should be made compulsory on each of the boroughs whose territory comprises the heart of London to appoint a borough architect. The functions of that architect would in no wise overlap either those of the district surveyors who have their appointed spheres under the London County Council or those of the surveyors already holding office under the boroughs. Both of these classes of men have their hands full, and do their work uncommonly well. His borough architect would have as his primary and simplest work the passing or rejection on purely æsthetic grounds of the designs of intended new buildings. His critical censorship would extend to the admissibility of altering valuable old buildings, and he would sometimes no doubt

ENTRANCE TO CHAPEL, MORDEN COLLEGE, BLACKHEATH.

have to exercise a veto against the destruction of work of historic or artistic value. With him, again, would lie the duty of advising his borough, probably in consultation with a central authority, on the formation of new streets or new frontages; it would be for him to decide whether in certain places individualistic architecture should give place to the grouping of houses in larger composition, and he would be looked to as the guardian of art in those public works which boroughs so often carry out without any architectural advice whatever. In cases where, as in the formation of squares or the approach to a bridge, collective architecture seems desirable, he would very probably be himself responsible

for the elevations, but the author would propose that he should be at full liberty to initiate a competition for such work or to advise the engagement of another architect. The borough architect, who must essentially be a man of accepted and conspicuous standing, should be paid a fixed yearly income for his services. He would not be debarred from general practice, but should be prohibited from private engagements in his district, in which he would only perform his critical and advisory functions and such works of general design as he thinks well to keep in his own hands, and for which no payment outside the yearly salary would be made. The reason for proposing that the borough architect

should not be debarred from general practice outside his borough was threefold: (1) It is of supreme importance that the men selected for these posts should be the very best that England can produce. The posts should be coveted among architects, not as berths, but as honours. If you make the holding of them conditional upon the abandonment of other outside work, you will deter the best candidates, the men who love their art for its variety of scope, the men whom no allurements of pay would entice from the free range of unfettered opportunity. (2) If the salary were made commensurate with the abandonment of the full practice of a first-rate architect, you would either

attract inferior men and mere place-hunters, or if you succeeded in bribing the best by a lure of gold, you would perhaps rob them of some of their vitality; for architecture is a sword which is kept bright and sharp in use. Moreover, you would be placing an unnecessary financial burden on the boroughs. (3) These engagements should not be permanent. It is before all things desirable that the duties of these posts should be fulfilled with extreme vitality. The initial appointment should be for three years only, renewable at the option of the borough for other successive periods of a like span. Such a system of tenure would make the acceptance of the posts impossible to architects in good practice unless they were allowed perfect freedom for the exercise of their private practice in conjunction with the borough work.

The nominations should come in the first instance from the Council of this Institute. Special conditions would no doubt apply to the nomination of the original appointments, but if once the scheme were in full working order the most natural procedure would be for each borough, when its vacancy occurs, to make application to the Council of the R.I.B.A. for the nomination of not less than two men from whom the borough would then make their own selection. The initial nominations would in like manner be made by the Royal Institute; but as there would be some seven or eight appointments to be made simultaneously a larger nomination, say of ten names, would be necessary.

That London will undergo some important changes in its street structure, and that within a few years, is perfectly certain; that these structural changes, whether effected under the Town Planning Bill or not, should be undertaken without architectural guidance would be an artistic disaster of the first quality, but it is a very probable disaster if no effective machinery is devised to meet the coming need.

The architect-in-chief would be *imprimis* the adviser of the London County Council upon the whole handling of their larger schemes. He would be officially the chairman of the monthly meeting of the borough architects; informally he would be their constant advisory colleague. There would be in the case of architects or owners objecting to the censorship of a particular design by a borough architect a right of appeal to the monthly board, and this would virtually mean that all doubtful cases would come before the architect-in-chief. Subject to a period of probation at the outset and of retirement at the close, his appointment should be both permanent and exclusive. His autocracy would be sufficiently tempered by the board of architectural colleagues.

Discussion.

Earl Beauchamp, proposing a vote of thanks to the lecturers, observed that there were exceedingly ugly buildings in London, and equally beautiful ones, both old and new. We were far too ready, he thought, to decry and depreciate the circumstances in which we lived; and he had little patience with those people who asserted that foreign countries were leading us in matters of art. We in England could produce extraordinarily fine work in almost every direction; and there was hardly any form of art in which we could not find an individual of ability among ourselves. Having alluded to the prevailing preference for old masters, which he deplored, the speaker advanced a plea for the more generous recognition of present-day artists. Passing to Mr. Waterhouse's paper, Earl Beauchamp said he thought that difficulty would be experienced in the matter of taste

or personal opinion. One could differ on politics or literature with one's dearest friend without serious trouble; but if the point happened to be whether a picture should have a blue or a green background, permanent rupture might be expected.

Mr. Whitaker Thompson (Chairman of the L.C.C.), seconding the vote of thanks, said that he had listened with interest to the very original proposals put forward. He knew something about sitting on committees, and he could picture the difficulty of the presiding architect who had to deal with the architectural representatives of, say, the borough of Stepney and the Royal Borough of Kensington. The idea, however, was well worth consideration. Advice on architectural matters was wanted, whether it came as Mr. Waterhouse proposed or red-hot from that Institute itself.

Sir Laurence Gomme said that London wanted an ideal of its own—not twenty-eight ideals, as Mr. Waterhouse's scheme would necessitate. The duty of architects of to-day was, he thought, to safeguard the principles on which development should be carried out. Street corners were very important, and he suggested that they should be dealt with first. He thought it would be a good idea to determine the street corners first, and to let the filling up of the areas in between come afterwards. If they visited any of the mediæval cities

such as Salisbury, or Chester, they would find beautiful buildings, although no professional architect had been employed in their erection. This, he believed, arose from the citizens' ideal to build beautifully for the city in which they lived. London was a city of lost opportunities; but architects, by continued endeavour, should be able to help towards improvement in the future.

Professor Beresford Pite said that for wealth of mediæval glory few cities could compare with London to-day. Consider only Westminster Abbey, St. Bartholomew's, Smithfield; St. Saviour's, Southwark; and the Temple. Passing to the Renaissance, there were Greenwich Hospital, Somerset House, and St. Paul's Cathedral. London was not a city of lost opportunities, but a city of gained opportunities. Passing from Renaissance London to modern London, the achievement of Westminster Palace was something that could challenge the whole modern world. Professor Pite concluded with a reference to the Mall improvement, which he hoped Sir Aston Webb would be allowed to bring to completion.

Sir Aston Webb, R.A., observed that undoubtedly the most important part of the meeting was Mr. Waterhouse's proposed architectural control. Upon his return from America he (Sir Aston) drew the attention of Lord Plymouth to the American

HOLYROOD PALACE, EDINBURGH FROM AN ETCHING BY ALBERT CHANLER.

Commission of Taste, and his lordship, upon representations from the Institute, brought the matter before the Government. There the matter had remained; but he hoped that in due course something would be carried out. As in the cases of the Sea Lord, and the Secretary for War, it would perhaps not be necessary that the gentleman holding the office of architectural adviser should be an architect. He would be a man of taste and education, and would be advised by experts.

Mr. Alexander Jamieson said that London could not be altered, and at the same time improved, from the artists' point of view. It was picturesque in itself, and an accident of growth. Any town-planning scheme under the supervision of an architect would not necessarily be beautiful.

Mr. Leonard Stokes said it should be borne in mind that the subject under discussion was a scheme for the development of London. At present the improvements that had been effected were rather isolated; but perhaps London would develop all over eventually to the same scale. At present the big developments were like patches over the city.

Mr. Rickards, replying, said his paper had been rather misunderstood. Mr. Waterhouse's paper he considered to be a gallant attempt at solving a difficult problem.

Mr. Waterhouse, in his reply, said that if he had his own way he would say, leave London alone. But it would not be left alone, and some scheme of development should be laid down.

SKETCHES OF OLD EDINBURGH.

We reproduce in this issue four sketches by Mr. Albert Chanler of portions of old Edinburgh; parts of the city which still retain traces of the character of the dirty, picturesque, mediæval city once habitually alluded to as "Auld Reekie," from the cloud of smoke which marked its position from a distance. But that was in days when large cities, in Scotland especially, were few and far between, and their smoke might well seem, to the habitual dwellers amid forest and heather, a sinister fact of life. The smoke of "Auld Reekie" was nothing to that made by modern London, but in those days people had not got used to smoke.

The backbone of old Edinburgh is the street which runs up the long ridge of the hill, under the successive names of Canon-gate, High Street, Lawnmarket, and Castle Hill, which form one direct thoroughfare, with a palace at the foot of the hill and a castle, appropriately, at the top. The ground was prepared in far-off ages of geological time by the deposit or the upheaval of the rock on which the castle stands, stretching from the scour of tidal waves the ground immediately behind, and leaving the formation familiar to geologists as the "crag-and-tail" phenomenon—the rock with a long trail of sloping ground behind it protected from the scour. Thus the blind forces of nature prepare the ground for the future strong positions of

man as a town-building and castle-building animal.

The whole grim glamour and romance of Scottish history seems symbolised in the dark turreted mass of Holyrood Palace, which stands sentinel on the level ground outside the Canongate, and forms the first of our illustrations. The Canon-gate, of which the ascent is shown in the next illustration, still retains a good many old houses. This leads up to the High Street, the most characteristic street of old Edinburgh, and through this, still ascending, we arrive at the Lawnmarket, shown in Mr. Chanler's third sketch, with the castle filling in the background.

The Mercat Cross ("Market Cross"?) is one of those bits of somewhat crude Renaissance work which, both in Edinburgh and Aberdeen, contrast so picturesquely with the ruder style of the mediæval street houses.

EXHIBITIONS.

The Leicester Gallery.

At this gallery there are two exhibitions on view. One of these is a collection of small landscapes in oil and water-colours by Mr. James Aumonier. These are rather varied in style, the artist being apparently a little uncertain in his aims. One drawing, "Across the Common," might be credited to Wimperis, for its broad water-colour style, but there is no other indication that the artist wishes to follow that school. Others, in a different style, are very good examples of composition in landscape. The other exhibition is a collection of water-colours by Mr. Hugh Norris, under the title, "In and Around a Painter's Garden." These are mostly what may be called foreground pictures of masses of flowers, showing excellent execution and a fine sense of colour; "Starworts in the big border" is especially good in this sense. The collection establishes the author as an accomplished artist in this class of subject, so much pursued at present.

Society of Painter-Etchers.

The exhibition of the Society of Painter-Etchers, now open, is always the most important exhibition of the year in black-and-white design. The present exhibition, if not quite equal to some of its predecessors, contains a great deal of good and interesting work, though we should have liked to see a larger proportion of examples of what can be done by the etched line pure and simple, without any of the processes of shading up, either with a multiplicity of lines or with tinting, which takes etching more into the field of engraving or of painting. Mr. Axel Haig's "Burgos Cathedral," for instance, is really engraving; Sir Alfred East's "Cotswold Village" might be imitated by brushwork. And line etching in the more free style proper to the art suffers from too great a multiplicity of lines, as in Mr. Hedley Fitton's "Church, St. Emilion," which is far too much scrawled over, while Mr. Goff's "St. Mark's, Venice," is so overloaded as to lose all brightness of effect. A comparison with M. Béjot's Paris scenes will show how this kind of thing can be done without losing light. The real power of etching lies in putting as much meaning as possible into a line, and leaving large spaces of white. As an example, look at Mr. Short's remarkable little work, "Winchelsea Marshes" (No. 55), where the whole perspective of the flat landscape is followed in lines of which every one tells its story. As Mr. Short is now President, it is likely that his influence will go towards

THE CANONGATE, EDINBURGH. FROM AN ETCHING BY ALBERT CHANLER.

a greater preponderance of pure etching, without any tricks of tinting.

Among the works which represent true style in etching are those of Mr. Nelson Dawson, Mr. Bentley, Mr. Martin Hardie, Sir C. Holroyd, and Mr. Charlton. There is a special collection of the works of the late Sir Seymour Hayden, an etcher who was rather uneven in his work, and has been somewhat over-rated, though he is very good at times, as in "Erith Marshes," and "The Breaking up of the Agamemnon," both of which are described as in their "first state," and are probably better in that state than after they were more worked upon.

An interesting feature connected with this exhibition is that members of the Society will give practical demonstrations in copper-plate printing on Tuesday and Thursday, during the exhibition, from 2.30 to 5 p.m.

The Goupil Gallery.

There are two exhibitions in this gallery. Mr. Horace M. Livens, whose work is exhibited in the downstairs rooms, is good in water-colour, which he treats in a rather flat style in a few tints; many of the landscape sketches are very pleasing. His manner of handling oil-colour, in representing street scenes and buildings, is what we call grim and unattractive; in his rather fine composition, "Chimneys," the sky and the chimneys seem to be formed from a thick layer of pigment violently batched into, so that the outlines of the chimneys seem to run into the sky. His real power in oil painting is in making colour pictures out of groups of domestic fowls; some of these, such as "Black Minorca and White Leghorn," are really fine in their way. Upstairs in the same gallery Mr. Ranken's water-colours of architectural and landscape subjects show much freedom and power of producing an impression by broad and bold handling; his large view of "St. Paul's Cathedral, from the South Door," is worthy of Mr. Sargent, whose bold architectural sketches it somewhat recalls.

Messrs. Dowdeswell's Gallery.

The collection of water-colours by Mr. F. W. Jackson at this gallery seems rather deficient in clearness and decision of colour, but the author has a feeling for the poetry of landscape composition, and his large coast scene, "Rough Sea at Staithes," shows that power of indicating incident by broad washes of colour which is so desirable in water-colour. There are other good landscapes, but the general impression is rather dull; there seems a lack of daylight in the scenes.

The Alpine Club.

At the Alpine Club Gallery there is an exhibition of paintings and enamels by two sisters (we presume), Miss Ida and Miss Ethel Kirkpatrick. The two cases of enamels by the latter lady, chiefly pendants and other personal ornaments, show a great deal of pleasing fancy in design and colour, though we rather question the suitability of miniature landscapes in enamel for pendants, and prefer those which are purely decorative. Miss Ida Kirkpatrick's water colours show a great deal of talent in a true, broad water-colour style; some of the sea studies at Sennen, and those of commons, bright with masses of gorse, are especially good.

A contract exceeding £1,000,000 in value, for the water supply to the city of Baku, in Russia, has just been awarded to Messrs. Griffiths and Co., Ltd., contractors, of London.

THE LAWNMARKET, EDINBURGH. FROM AN ETCHING BY ALBERT CHANLER.

CHEAPER SCHOOL BUILDINGS.

The Departmental Committee appointed by the President of the Board of Education in February, 1910, to investigate the possibility of reducing the cost of school buildings has now presented its report, which was laid on the table of the House of Commons last week. It will be remembered that the appointment of the Committee was due to the anxiety felt by Mr. Runciman lest the heavy expense involved by the erection of schools in accordance with modern standards should prevent local education authorities from keeping pace with the needs of the districts under their administration in respect of school accommodation. The President of the Board of Education desired to ascertain whether any of the new methods of construction or new materials which have been introduced offer any prospect of relieving the financial strain which was placed on the authorities in the fulfilment of their

obligations to the children for whose education they are responsible; and as there did not appear to be any immediate likelihood of practical tests being made to determine the suitability of novel methods, or materials for the purposes of school buildings, he decided to employ the resources of the Board of Education in order to obtain such information as was obtainable for the guidance of local education authorities. The terms of reference to the Committee were that it should inquire and report: (a) Whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present; and if so (b) what steps should be taken to facilitate the adoption of such materials or methods, and whether any alteration in the law is required for the purpose. It is hoped that the report of the Departmental Committee will be issued to the public in the course of a few days.

IN PARLIAMENT.

[BY OUR GALLERY REPRESENTATIVE.]

Suggested Cleaning of Buckingham Palace.

Mr. Ingleby having asked whether, in view of the Coronation, it was proposed to improve the appearance of the front of Buckingham Palace by cleaning or otherwise, Mr. Dudley Ward, on behalf of the First Commissioner of Works, replied in the negative. He said it was unlikely that cleaning would effect the improvement suggested by the honourable member.

Ventilation Troubles in the House.

Mr. Dudley Ward, having received a complaint about the grill ventilators in the tea room and news room of the House of Commons being fruitful sources of colds and chills among members, has stated that the ventilation of these rooms is a matter not unattended with difficulty, but that during the Easter Recess a fresh-air inlet to discharge overhead will be substituted experimentally for one of the existing ventilators in the news room, and that if this proves successful similar alterations will be made generally.

New Post Office at Bolton.

Mr. Dudley Ward, in reply to Mr. Gill, stated, February 16th, that the contract for the erection of the new Post Office at

Bolton had not yet been let. The date of doing so depended upon the date of Parliamentary sanction being given for the expenditure to be incurred on the service. The beginning of building operations could be made about three weeks after a tender was accepted.

Hoarding in St. James's Park.

Mr. Dudley Ward informed Sir Henry Craik that the hoarding now erected in St. James's Park at Storey's Gate is temporary only. On the completion of building operations there will be a slight alteration of the former boundary, resulting in an addition to the area of the Park.

Rosyth Docks.

Mr. McKenna, replying to Mr. Goldman, stated that the granite as well as all other materials for the Rosyth works was inspected by the Admiralty staff employed on the works. Special inspectors were not employed for granite only. The necessary qualifications of the staff had been acquired by practical experience on other similar work.

Mr. Fell asked if the plans for the works at Rosyth had been amended.

Mr. McKenna replied that one graving dock was included in the original contract, but, as already stated, provision would be made in the Estimates for the ensuing year for a second dock. No amendment in the

Rosyth general design was necessary, as the inclusion of more than one dock was always held in contemplation.

Rates of Pay at Redford Barracks.

Mr. Haldane, replying to Mr. John Ward, stated that a complaint was received that in some cases labourers employed under the contract for the foundations of the new barracks at Redford, a few miles from Edinburgh, were not receiving the rate claimed for such work in Edinburgh. The matter was not free from difficulty, but to prevent the recurrence of any doubt the payment of the recognised Edinburgh rates had been stipulated for in the contract just made for the construction of the buildings.

Housing and Town Planning:

The Court of Appeal.

In the House of Commons, February 16th, Mr. Newdegate asked the Prime Minister whether representations had been made to the Government that the Local Government Board were not a suitable court of appeal from the decision of local authorities under the Housing and Town Planning Act, 1909; and, if so, whether he would cause a Bill to be introduced to amend the Act by substituting a judicial tribunal for the Local Government Board as the appeal court.

Mr. John Burns, who replied, said: Representations to the above effect have been received by the Local Government Board from 15 local authorities in all, out of over 1,800 in England and Wales, and also from Messrs. Rubinstein, Nash and Co., solicitors. Since the Act came into operation there have been 52 appeals to the Board, and in all 11 inquiries have been necessary. It is significant that none of the local authorities making the representations have had any experience of the Board's inquiries into appeals under the Act. I may mention that of the appeals to the Board 26 were withdrawn or for some other reason did not proceed. In seven cases the appeal was allowed. In eight other cases the appeal was dismissed. The question of making the Local Government Board the court of appeal in these cases was very fully discussed on many occasions when the Bill for the Act of 1909 was before Parliament, and there does not seem to be any good reason for altering the Act as suggested. The latest figures available—those to 31st March, 1910—show a material increase in the activity of local authorities in regard to closing orders, and no doubt later figures will show that this very salutary increase has been maintained.

Proposed Amendment of the Act.

Mr. John Burns, on another occasion last week, in the House of Commons, stated that he had not lost sight of the suggestion that the legislation dealing with Housing and Town Planning should be consolidated in one Act, so that it might be made more intelligible to members of district councils and other local authorities. He thought, however, that consolidation should be accompanied by amendment, and it would be wise to await some further experience of the working of the Act before proceeding to amendment.

MERCAT CROSS, EDINBURGH. FROM AN ETCHING BY ALBERT CHANLER.

The New Temperance Memorial Hall, Newcastle-on-Tyne, is being ventilated by means of Shorland's patent exhaust roof ventilators and inlet ventilating panels, supplied by Messrs. E. H. Shorland and Brother, Ltd., of Failsworth, Manchester.

OBITUARY.

Colonel Eustace Balfour.

The late Col. Eustace Balfour, who died on Tuesday last week, took a keen interest in architecture whilst he was an undergraduate, and on leaving Trinity College, Cambridge, became a student in the office of Mr. Basil Champneys. In 1870 he began to practise on his own account, and in 1885 he entered into partnership with Mr. Thackeray Turner, with whom he continued in harmony until the end. In 1890 he was appointed surveyor to the Grosvenor estates by the late Duke of Westminster. He was one of the few men, says the "Times," who instinctively realised the potentialities of an old house lacking architectural merits, and few were better able to evolve a decorous and dignified interior out of a commonplace room. His plaster-work was admirable, full of vigour and substance, and he was a warm partisan of robust cornices with bold and freely modelled detail. This love of well-placed decoration can be detected wherever Col. Balfour was responsible ab initio, though in the well-known house erected in Park Lane for Mr. Beit it would appear that the architect was over-scrupulous, being reluctant to adorn the exterior with the deep-cut enrichments so brilliantly applied by Vulliamy to Dorchester House, close by. St. Anselm's Church, Davies Street, W., is perhaps the most complete and instructive example of his work, while the latest, and not the least characteristic, of his architectural achievements was the rebuilding, in co-operation with Mr. Thackeray Turner, of the historic Scottish Church of Crown Court, Covent Garden. Col. Balfour did a good deal of work at Whittingehame, the home of his family; and Ampton Hall, near Bury St. Edmunds; Charlwood, Mr. Alfred Hoare's house at East Grinstead; and the chapel at Hatfield Hyde should also be mentioned.

Mr. Charles Baker.

The death is announced of Mr. Charles Baker, architect, of Leicester, aged 77. Deceased was the representative of probably the oldest firm of architects in Leicester. He was articled to the late Mr. Wm. Flint, who originally initiated the practice. It then became Messrs. Flint and Shenton, and later Mr. Baker went into partnership and the business was known as Shenton and Baker. It continued so until about five years ago, when the practice was merged into that of Messrs. Tate and Herbert, architects and surveyors, of Friar Lane. Mr. Baker was responsible for many well-known buildings in Leicester and the county, among which may be included the Wyggeston Boys' School.

Mr. Edmund Grove.

By the death of Mr. Edmund Grove on February 11th, at Brighton, the Institution of Civil Engineers loses its oldest associate member. Born in 1824, Mr. Grove received his earlier education at the hands of Dr. Pritchard, who in his day sent so many men into the world to earn distinction and bring credit to his teaching, and on leaving Clapham Mr. Grove was trained as a civil engineer. In due course he joined Mr. Wild's staff in Great George Street, and for him did a great deal of railway work, especially in the Eastern Counties. When the railway mania came to an end, Mr. Grove joined the Messrs. Cochrane in founding the Cleveland firm of Cochrane, Grove and Co. A man of cultured mind,

liberal views, and sound judgment, Mr. Grove was also a keen musical critic, and took great interest in the Royal College of Music, with which the name of his brother, Sir George Grove, will always be linked.

The Late Mr. C. Hodgson Fowler.

The late Mr. C. Hodgson Fowler, diocesan architect, Durham, left estate which has been proved at £14,998 gross.

Mr. P. D. Scott-Moncrieff.

Mr. P. D. Scott-Moncrieff, assistant in the Department of Egyptian and Assyrian Antiquities in the British Museum, had made a series of copies of Egyptian stelæ, etc., in that institution, and was the author of several papers in the publications of the Society of Biblical Archaeology.

Mr. John Athron.

The death is announced of Mr. John Athron, a well-known Doncaster architect, at the age of 40. Deceased took a prominent part in the work of the Doncaster Art Club, of which he was for some years the secretary.

THE ARCHITECT, THE BUILDER, & THE SPECIALIST.

At the annual dinner of the Manchester, Salford, and District Building Trades Employers' Association, Mr. George Macfarlane, in proposing the toast of "The Manchester Society of Architects," said that the architect must be a man of many parts. Not only must he be a skilled artist in his own special work, but he must also have a fair knowledge of law, physics, hygiene, and sundry other acquirements that constitute the "all-round man." In the good old times, when the art of building attained its highest point of excellence, the architect was the master builder, and the name of contractor was unknown; but division of labour is the tendency of present times, and the profession of the architect and the craft of the builder, although still linked together, have their own special spheres, separate and distinct. Their individual interests, instead of being, as they ought to be, identical, are sometimes in conflict. The ideal condition should be unity of aim and purpose; but present-day competition, and the struggle to get work, keep widening the gap, and harmony and co-operation are giving place to hard and strict commercialism. The endeavour to get satisfactory results from the lowest bidder is an endeavour to attain the impossible—to get good things cheap. The only work that can give lasting satisfaction to either architect or owner cannot be had except at a fair remunerative value. It must be a source of worry and anxiety to a conscientious architect to know that the contractor who is doing his work must either "jerry" it or lose by it. Architects have quite enough to carry, without that added trouble. Yet, so long as the cheapest man wins, and crowded competition is the order of the day, architects will have this anxiety added to their other trials.

Scarcity of work and stress of competition are a temptation for builders to "cut low" and risk the chance of making a bit by some unforeseen lucky circumstance. But to make such expectations the only means of getting any remuneration is to build upon an unsound foundation, which will sooner or later bring disaster.

Modern conditions are telling against architectural progress. The purse-strings are continually in evidence as regards both the architect and builder, and woe betide

either of them should the amount of the contract be exceeded, or some mistake be made, or something forgotten. Everything must be foreseen and anticipated to the minutest detail. But was there ever a job carried through absolutely free from mistakes? He questioned it. They will creep in, in spite of the utmost care.

Some critics say that the art of architecture has long passed its zenith. Ruskin said that during the 13th century architecture reached the top of the hill and it has been going down on the other side ever since. Certainly the stonework of our old English abbeys and cathedrals, all built between the 12th and 14th centuries, illustrates building in its grandest scale, unrivalled for beauty and magnificence. That was, in a manner of speaking, the "Stone Age." Now we are in the "Iron Age." The mason and the bricklayer are being ousted by the riveter. As was said the other day about iron construction in buildings, "This sort of thing is not architecture; it is not building; it's boiler-making." But, after all, when it comes to erecting an artistic building, whether it be a cottage or a castle, you have to fall back on the old methods. There never was such a time as this for choice of materials to build with. It is becoming next to impossible to remember the various names of the new materials—substitutes for stone, for bricks, for timber; substitutes for everything and everybody. In fact, the building trade is in a state of flux or transition. New types are replacing the old. Either for better or worse the old order of things is passing and giving place to new. This is the day of the specialist. He is fast becoming master of the situation. Even the architect has to stand aside and bow to him. The ordinary tradesman has to speak to him with "bated breath and whispering humbleness."

Yet, in spite of all our mutual troubles, both the architect and the builder manage to pull along, and upon the whole we pull along wonderfully well together, and without very much friction. Neither of us will ever be without our grievances. The nature of our employment is such that we are continually coming up against conditions that demand a spirit of forbearance, a disposition to adjust matters of difference by mutual concessions, and by assisting one another out of difficulties. I have had more than fifty years' experience with architects, and the men I have known during that time have, with very few exceptions, been gentlemen of honour and worthy of trust.

THE TOMBS OF EGYPT.

At the Royal College of Surgeons, last week, Professor G. Elliott Smith, of Manchester University, delivered the first of a series of three Arris and Gale lectures on "The History of Mummifications." The prehistoric Egyptians, he conjectured, acquired the conviction that the preservation of the body was the condition necessary for the attainment of immortality. This naturally led them to lavish still more care on the housing of their dead, as was shown by the rapid evolution of their tomb-architecture and equipment. This was rendered possible in the middle of the known pre-dynastic period by the discovery of copper; and the vastly enhanced scope that metal tools gave to the carpenter and stonemason by the end of the pre-dynastic period was at once demonstrated in the aggrandisement of the tomb and the invention of coffins of wood or stone.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editors desire to give notice that answers to the following enquiries can no longer be undertaken:—

- (1) Enquiries about buildings to measure in particular towns and districts.
- (2) Enquiries embodying questions which have been set in examination papers.
- (3) Enquiries which ask for or require the preparation of special designs as part of the answer.

System of Filing.

W. J. and W. (TORQUAY) write: "Can any of your readers give suggestions for an economical and ready system of filing drawings ($\frac{1}{8}$ in. scale, $\frac{1}{2}$ in. scale, and full size details), preferably flat in drawers, the drawings being in all sizes?"

—[We shall be obliged if readers will correspond with regard to this enquiry.]

A Light and Air Question.

"DOUBTFUL" writes: "The enclosed plan shows the position of an existing warehouse, whose external walls, following the line a, b, c, d, f, g, rise to a height of 47 feet above ground level. The owner, A, of this building wishes to increase his accommodation by covering the plot of land B with buildings as shown by hatched lines, the intention being to carry the new buildings to the same height as the old, as indicated on sections.

"The adjoining owners of buildings C, D and E, have windows at w, x, y and z, which have existed for over 20 years. Could either of these owners legally object to the proposed buildings on the ground of interference with light and air? If so, to what extent must the proposed building be curtailed in order to avoid interfering with the adjoining owners' ancient lights?"

—There is no doubt whatever (under the circumstances you detail) that the two windows at w, the two windows at x, and those

at y and z, constitute ancient lights, and must be regarded as coming within the provisions of the Prescription Act accordingly.

The new building would to some extent diminish the light received by them all, but I do not suppose that owner E (windows y and z) would be seriously affected. Owners C and D (four windows marked w and x) would certainly suffer a good deal, and I should strongly recommend A to approach them both before commencing the proposed works.

Legally the position is that although it may be an undoubted fact that all the adjacent owners will lose light to some extent, they possess no legal remedy unless the diminution is so serious as to constitute a real (and not merely sentimental) loss to them, and partially unfit their properties for the purposes for which they are now employed. There are many decided cases to this purport. In deciding this question it is necessary to take into consideration the character of the district (e.g., residential, manufacturing, etc.) and any special circumstances there may be—for instance, an owner cannot expect so much light in the City of London as he would have a right to demand in a "garden city."

F.S.I.

Construction of Studio.

B. P. (LONDON) writes: "(1) A studio, about 20 ft. by 14 ft. is to be built entirely of glass on a stone plinth 3 ft. high. Do you consider it would be practicable so to construct it that it may easily be taken to pieces in order to erect it on another site if desired; or would the bother entailed, including risk of smashing glass, etc., on transit, make it hardly worth while?"

"(2) What sort of jointing, etc., would you recommend if a framework as above were made to be taken to pieces?"

"(3) Can you give me the address of a firm that import collapsible wooden houses from Norway or Sweden?"

—(1) and (2). It is of course practicable to construct such a building, though if it is to be frequently removed the stone plinth seems rather a curious provision. The least risk of breakage would probably be incurred if the sides and top consisted of complete framed and glass sashes which could be dropped into position between rebated uprights, tenoned to heads and sills so that all could be taken apart in sections.

I know of no firm importing Scandinavian collapsible houses, but Mr. S. Lee, of 7, St. Helen's Place, London, E.C., had such a house on exhibition at the first Letchworth Cottage Exhibition, and may supply them.

G.

Down-draught

E. E. L. (BIRMINGHAM) writes: "Kindly advise me as to the best method for stopping the back-draught down the flues of a chimney stack. Two houses adjoin each other, and the flues form one stack at front and another at the back—four flues

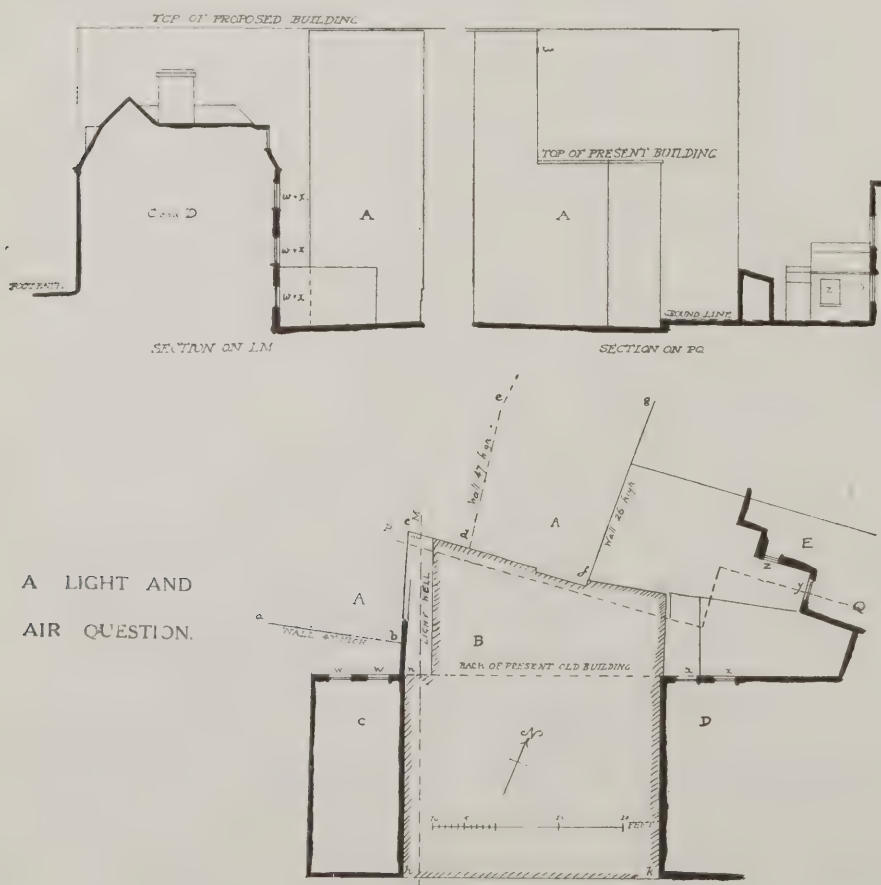

each. The tenants complain that when they light a fire in one room the other rooms get full of smoke. The stacks run about 2 ft. 6 in. above the roof, and are topped with small plain pots."

—If it is certain that the cause of the trouble is down-draught and not defective withes it may be lessened by raising each alternate flue in the four-flue stacks with taller pots, as sketch. There is a pot on the market known as the "spigot louvre," which permits this to be done without the expense and trouble of unsetting existing pots, as it fits into any ordinary pot like a socket. This is an inexpensive terra-cotta pot, and is independently efficacious in preventing down-draught.

NEW TRAMWAY SCHEMES.

The outstanding feature, so far as tramway legislation is concerned, in the present session of Parliament will be the powers sought by different local authorities and companies with regard to what is known as the railless electric traction system. This system is in operation at several places on the Continent, but nowhere in this country, although last session it was authorised in the case of Leeds and Bradford. Two Bills affect Brighton and District, although one contemplates the construction of the ordinary track tramways. Seven new companies are proposed to be incorporated for railless traction, and the districts affected are Western Valleys (Monmouthshire). Rotherham, Oldham, Croydon, Macclesfield, Malvern, and Matlock. Five local authorities, viz.: Aberdeen, Chiswick, Newcastle-on-Tyne, Northampton, and Rotherham, are also asking for powers. Powers for further tramway construction are also being sought by the following local authorities:—Belfast, £39,000; Hull, £41,000; Manchester, £7,850; Newcastle-on-Tyne, £74,451; Rotherham, £19,943; Northampton, £139,403 (including street works); Paignton, £9,150; Southampton, £28,170; and the London County Council, £973,960 (including street widenings).

SPRING DANCING FLOORS.

The accompanying illustrations show the patent "Valtor" spring floor which Messrs. Francis Morton, junior, and Co., of 110, Cannon Street, London, E.C., have devised after much investigation and study. The floor is particularly resilient, and the makers claim that this quality is secured without any weakness due to over-lightness of parts or the introduction of rubber pads, cork, felt, or other perishable material. The design is based on the assumption of the floor being possibly used for ordinary purposes at any time—as for public meetings, concerts, etc.—where a load of $1\frac{1}{4}$ to $1\frac{1}{2}$ cwt. per sq. ft. may be imposed; in which event the springs, if closed coil to coil by the dead load, will regain their original height, without set or distortion, upon the removal of the load.

The drawing reproduced on the next page shows the simplest form of the installation. There are one, two, three or more lines of "Valtor" steel girders, according to the width of the floor, each line being divided into short lengths linked together by patent spring fitments. The latter consist simply of a cast-iron casing enclosing a steel helical spring which is held in position on a ferruled base secured to the support below (wall, pier, girder or stanchion, as the case may be), the casings being connected in pairs by being bolted through the webs of the girders. The extreme ends of each line of girders is pivoted on a cast-iron rocker, and in this way, it will be noticed, the whole floor is kept absolutely free from any fixed attachment to the walls. In cases where the depth from the finished floor level to the foundations or supports is limited, the timber floor joists rest upon timber plates bolted to the webs of the "Valtor" girders, and in the firm's smallest-size installation the joists rest on the lower flanges themselves, being tied underneath with steel straps. With this small-size installation the whole floor can

HALF-PLAN OF SPRING FLOOR AT EASTBOURNE.

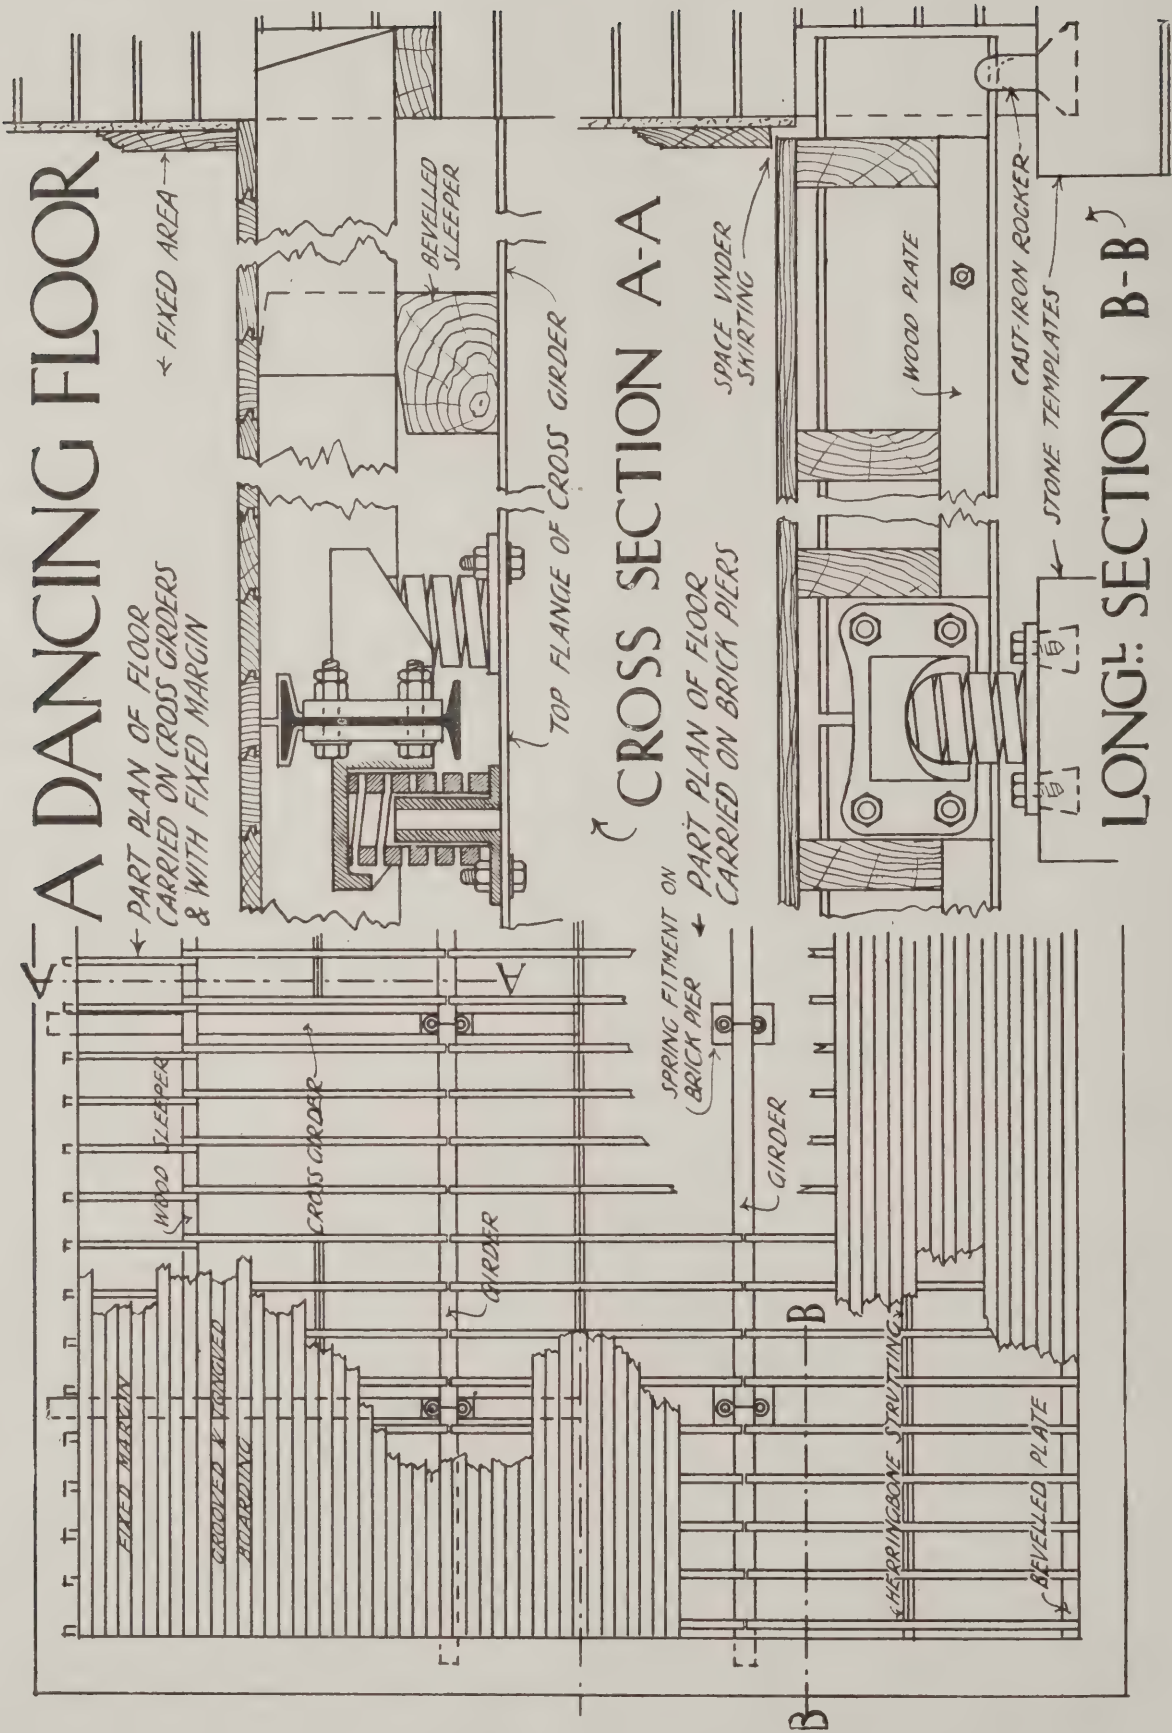

be got into a depth of $6\frac{1}{2}$ ins. from the top of the floor to the underside of the ferruled bases upon which the fitments stand; this, in fact, is the actual depth in the case of the new ball-room floor at the Savoy Hotel, installed by Messrs. Morton, jun., and Co.

The foregoing description applies to the "Valtor" system as ordinarily applied, but circumstances sometimes require an

adaptation of it to be adopted, as where the depth above the girder is limited to, say, 3 or 4 ins. In this case the springs are carried upon brackets bolted to the cross-girders, the "Valtor" girders themselves being connected across the top flanges of same with special steel spring straps so as to prevent any sudden shear in the floor boards. This is the system

PLANS AND SECTIONS SHOWING WEDGING GEAR FOR PATENT SPRING FLOOR.

This is a Patented Type of Floor, particulars of which are given on the preceding page.

adopted at the Waldorf Hotel, London, at the Londonderry Guildhall, and for one of the floors of a dancing academy in Chelsea: though the expense is heavier than for the ordinary system.

Another fitting which the firm have recently introduced enables the floor to be converted from a resilient to a rigid condition by means of a wedging arrangement. In cases where there is sufficient depth underneath the floor, this result is secured by driving wedges or blocks between the underside of the "Valtor" girders and the tops of the piers upon which the fitments stand, while in other cases where access beneath the floor is not possible, the same system of wedging has been carried out from above, by leaving either small traps in the floor over the fitments, or by having short lengths of the floor boards screwed down so as to be easily removable. Exception, however, is sometimes taken to this method, as it involves breaking up the continuity of the floor boards. To meet all requirements, therefore, Messrs. Morton, jun., and Co. have devised the wedging gear shown by the drawings reproduced on page 207 (one of which is the half-plan of a floor at Eastbourne). The gear consists of steel wedges on steel straps passing underneath and across the lines of "Valtor" girders, the straps being connected at one end either around a pulley or by a cross-head, and being attached at the other end to a toothed quadrant worked from a pinion wheel by a key inserted from above: by which means the wedges can be withdrawn or put in place under the girders as desired, thus making the floor either resilient or rigid. At the Savoy Hotel there are about twelve sets of such gear, actuating 120 spring fitments, and the whole change can be effected by a couple of men in a few minutes. The device is clearly a most useful one, as it enables floors which may only occasionally be required for dancing (such as billiard-room floors or gymnasia) to be altered to suit each requirement.

With regard to the laying of the timber-work of the floor, there are numerous ways of doing this according to the particular situation of the room. If the depth allows, the simplest form is that in which the timber joists are laid loosely across the tops of the "Valtor" girders in short lengths spanning one bay, being held upright in position by a line of herring-bone strutting down the centre of each bay (the strutting being omitted over the spaces where the "Valtor" fitments occur). Along each of the side walls the joists rest loosely upon bevelled timber plates, as shown. The floor boards should be of oak or maple (the former for preference) laid in straight lengths, tongued, grooved and secret-nailed. Where the resilient floor reaches to the walls all round, the skirting must be kept free from the floor so as to prevent any risk of the resilient portion causing vibration to the plasterwork of the wall.

Where size permits, Messrs. Morton, jun., and Co. recommend that there should be a fixed border along the sides, and also occasionally at the ends of the room, as with this arrangement there cannot be any sudden drop between the fixed portion and the resilient portion, as the latter hinges along the line under which the supporting sleepers are placed; nor can there be any difference in level where the two areas meet, and, consequently, no edge over which people might trip. Another point worth mention is that each spring fitment is a unit in itself and affects the area immediately over it; hence the floor

does not depend upon the whole of its surface being occupied in order to possess resiliency, and the system is therefore as effective in a small room with perhaps half-a-dozen fitments as in one 100 ft. square.

NEWS ITEMS.

Municipal Architecture.

The Torquay Town Council have agreed to pay their borough surveyor, Mr. H. A. Garrett, the sum of 500 guineas for his extra services as architect for the Pavilion, the Council bearing the cost of additional assistance and expenses incurred in connection with the work.

* * *

The Statue of the late Duke of Devonshire.

This statue, unveiled last week in London, is in Horse Guards Avenue—to the south of the new War Office. It is of bronze on a pedestal of Darley Dale stone. Mr. Herbert Hampton was the sculptor, and Messrs. Kirkpatrick Bros., of Manchester, were the contractors who executed the work.

* * *

H.M. Office of Works and Public Statues.

The Mayor of Westminster (Mr. E. L. Somers Cocks) announced at last Thursday's meeting of the Council that the Office of Works had taken over the charge of the statue of the Duke of Devonshire; and it was also understood that the Office of Works would in the future undertake all such duties.

* * *

A South London Subway.

The Elephant and Castle Subway Committee recommend the Southwark Borough Council to proceed with the construction of a new "arm" to the Elephant Subway, from the corner of Newington Causeway and New Kent Road to the corner of Walworth Road and New Kent Road, at the approximate cost of £1,700.

* * *

Rochester Bridge to be Rebuilt.

The tender of Messrs. John Cochrane and Co., engineers, London, for the rebuilding of Rochester Bridge has been accepted. The amount of the contract is about £70,000, and the work, which will be commenced almost immediately, will take from two to two-and-a-half years to complete. The bridge will be a steel structure.

* * *

Laying the Last Brick at Jarrow Baths.

An inspection was made last week by members and officials of Jarrow Town Council, of the new public baths in Walter Street, when the ceremony of laying the last brick was performed by the chairman of the baths committee, who was presented with a silver trowel by the builder, Mr. Stephen Sheriff. The architect (Mr. Morton, of South Shields) and the builder were honoured with toasts.

* * *

St. Philip's Birmingham.

The fine tower of St. Philip's, Birmingham, of which Professor Reginald Blomfield, in his "History of Renaissance Architecture in England," wrote that it "is helped by its commanding position, but is certainly a powerful and original design, and unlike anything of its kind in England," has been for some time badly in need of repair and the first practical steps have just been taken to ascertain its exact condition; scaffolding is being erected, by means of which a

thorough examination can be made. The church was designed in 1710 by Thomas Archer.

* * *

Law Courts Extension.

Such progress has been made with the new buildings extending the Law Courts on the west side that the completion of the structure may be expected within the contract time—July, 1912. The work was begun in November, 1908, and the top storey has now been reached. Parliament voted £100,000 for the work. The building provides for four new courts, each 45 ft. by 36 ft.

* * *

A New London Fire Station.

The London County Council propose to erect a new fire station for the St. John's Wood district in place of the existing station in Adelaide Road, Finchley Road, where the accommodation is very inadequate. The site proposed is at the junction of Eton Avenue and Lancaster Road, the estimated cost of which is £3,250. The cost of the building will probably be £12,000.

* * *

The Royal Exchange Panels.

Two new panels have been accepted by the Gresham Committee for the ambulatory of the Royal Exchange. One is the gift of Mr. W. W. Aston, and depicts "William II. building the Tower of London," the artist being Mr. C. Goldsborough Anderson. The other panel, which portrays "Henry VI., the Battle of Barnet: the Trained Bands marching to the support of Edward IV.," is presented by Mr. Arthur Franklin and his brothers, and the painter is Mr. J. H. Amschewitz.

* * *

Road Board Grant.

The Road Board have, with the approval of the Treasury, made from the Road Improvement Fund a large number of advances to county councils and other highway authorities. Lancashire gets about £35,000 (£82,150), Kent £20,000 (£64,900), Notts £10,000 (£14,900), Lincolnshire £10,150 (£45,000), Bucks £5,000 (£10,000), Carnarvonshire £3,000 (£3,500), Bedfordshire £390, and Berkshire a grant of 10 per cent. on the annual loan charges on £60,000. The figures in parentheses refer to the respective costs, and are only roughly approximate.

* * *

Why should Factories be Ugly?

The Brewster Building now being completed on the Queensboro' Bridge Plaza, Long Island City, resembles in exterior treatment a high-class office building rather than a factory. It has a reinforced concrete skeleton frame, no part of which is exposed except on the rear, the three other sides, facing on the Plaza and two streets, having a red brick facing trimmed with artificial stone and ornamental iron fascias. The building contains seven storeys and basement, measures 200, 352, and 170 ft. on the street and Plaza frontages, covers an area of about 55,000 sq. ft., and represents an investment for the structure alone, exclusive of the land and equipment, of over 600,000 dols. The roof is 96 ft. above street level and is surmounted by a clock tower, 25 ft. square and 84 ft. high, the top of which, consequently, is 180 ft. above the street. The building was designed by Stephenson and Wheeler, New York, and built by Messrs. Tucker and Vinton, New York, using reinforcement supplied by the Trussed Concrete Steel Company, Detroit.

THEATRE LIGHTING.

THE ELECTRICAL INSTALLATION AT THE
PALLADIUM.

Some idea of the electrical equipment in a modern theatre may be gained by the public from the auditorium, but an inspection "behind the scenes" alone can reveal the extent and complexity of the installation. We have recently had the opportunity of examining, in detail, one of the latest London theatres—the "Palladium," some account of the electrical equipment of which may here be given as likely to be of interest to readers.

The building is situated in Argyll Street (off the top of Regent Street), and was formerly known as "Hengler's Circus." Under the direction of Messrs. Frank Matcham and Co., the well-known firm of theatre architects, the interior has been completely remodelled and redecorated, and an elaborate electrical installation has been provided by Messrs. Siemens Brothers and Co., Ltd., and Messrs. Siemens Brothers Dynamo Works, Ltd.; the wiring contract having been sub-let to Messrs. Rashleigh, Phipps, and Co., Ltd.

In accordance with the regulations of the London County Council, current is supplied from two separate companies—the St. James's and Pall Mall Electric Light Co., Ltd., and the London Electric Supply Corporation, a pressure of 110 volts being employed for all the lighting and 220 volts for motors, fuses, etc.

The stage equipment comprises an immense switchboard over a gallery at one side, a vast array of regulators for "dimming" and special effects, seven 52 ft. battens of lights (each having 250 lamps) over the stage, and a multitude of "hanging lengths," "bunch lights," etc., comprising altogether more than 2,400 glow lamps, mostly in three different colours. By these means, with the addition of 18 arc lamp projectors (9 on the stage and 9 in the auditorium), any desired effect can be obtained; in fact, it is astonishing to see how the stage may be flooded with light of any colour, and then darkened or softly altered to any other colour, with the utmost nicety.

The regulators, it may be explained, act through a series of resistances, which can be thrown in or out of the circuit as required.

On the stage side there are to be noticed, also, an electric lift of the semi-automatic push-button type, by means of which a portion of the stage 20 ft. by 10 ft. can be raised or lowered for special scenic effects; and an electrically operated "Vortex" suction cleaning plant, in connection with which a system of pipes is laid throughout the house; thus, by connecting lengths of flexible hose to what may be called "air hydrants," the seats, carpets, etc., throughout the auditorium can be cleaned of dust

and dirt, which is drawn into the cleaning plant, and discharged into the drains.

The lighting of the auditorium is shown by the accompanying photographs. There are two 50-light electroliers (each 12 ft. by 9 ft. in diameter) fixed in the ceiling, and a large number of smaller fittings, all of Georgian character, in keeping with the general style of the decorations. The glow lamps are of the Siemens "Tantalum" and "Onewatt" metal filament type, the total number of these lamps in the whole building being close on 4,000. All circuits are protected by Siemens "Zed" fuses, which ensure the absolute security of the installation, owing to the great ease and rapidity by which the "blown" cartridge can be replaced, and also by reason of the fact that it is impossible to replace one by another of a larger or smaller capacity. Notable, too, are the "Holophane" reflectors, which distribute the light in the most perfect way.

Altogether the installation is a most interesting one, and when it is remembered that in addition to the equipment already described there are numerous telephone systems, electric bell circuits, arc lamps, electric fans, and other fittings, it will be understood that the design and execution of such an installation is a matter demanding wide experience and full knowledge; and the engineers and electrical firms responsible for the work are therefore to be congratulated on the remarkably successful result they have achieved. The length of electric lighting wire installed amounts to no less than 30 miles, and the length of enamelled steel conduits to no less than 8 miles.

The London (Bridges) Bill promoted by the City of London Corporation with the object of obtaining sanction for the St. Paul's Bridge scheme has passed the second reading without opposition. It will, no doubt, be strongly contested in the Committee stage, there being no fewer than 36 petitions against it; among the petitioners being the Dean and Chapter of St. Paul's and the R.I.B.A.

NOTES FROM PARIS.

The Central Society of French Architects held its annual general meeting on January 16th, under the presidency of M. Girault. The chief subject under discussion was the proposal to federate the various societies.

The Peruvian Government has signified the intention of appointing a Frenchman as architect-constructor. The architect would be entrusted with the control, under the Ministry of Public Works, of the architectural section of the Lima School of Engineers. The salary is to be about equivalent to £50 a month, with two years' agreement, and passage out and home paid by the Government. An ex-student of the Ecole des Beaux-Arts will be preferred.

MM. Chastenet and Messimy have lodged an interpellation complaining of the neglect of votes of the Chamber concerning the defence of the artistic interests of the City of Paris, which, they declare, are becoming "more and more compromised," as much by their abuse as by failure of the Prefecture of the Seine to enforce its powers.

The number of accidents occurring to workmen in France during the year last past, and resulting in incapacity for more than four days, was 383,249, as compared with 369,027 during the preceding year. The metal-working industries show the greatest number of accidents—277 per 1,000 workmen; stoneworkers come next with 156 accidents per 1,000 workers.

The Minister of the Interior has been authorised to disburse a sum not exceeding 340,000 francs on the representation of France at the forthcoming International Exposition of Hygiene at Dresden.

At a meeting of the Academy on February 11th, M. Daumet communicated the report of an investigation made by M. Birot, architect, at Vienne, in the Isère, and curator of the museum of that town. The report has reference to an ancient mound, 325 ft. long by 65 ft. long, beside the Rhône, which is thought likely to prove of considerable archæological interest.

The Fédération Centrale de Bâtiment held, on February 12th, at Rouen, its annual general meeting. The chief matters under discussion were the laws relating to strikes and industrial accidents, the latter being characterised as a standing menace to employers because of the abuses to which it gives rise. It was suggested that employers should combine in a scheme of insurance against the losses incurred in consequence of local strikes.

The Godebœuf competition of the Ecole des Beaux-Arts, for designs for a metropolitan railway station, has resulted in the following awards: Prize for foreign students, and first-class medal, M. d'Amato (Laloux). Prize for French students, and first-class medal, M. Castel (Bernier). First-class medals, MM. Debat-Ponsan (Laloux) and Girardin (Paulin). Second-class medals: MM. Ansaloni (Defrasse), Barbotin (Laloux), Bonhomme (Héraud), Bossis (Laloux), De la Bouglise (Lambert), Canuzat (Pascal), Cassagne (Laloux), Chaurès (Pascal), Deveraux (Paulin), Gabriel (Paulin), Gelis (Lambert), Van Alen (Laloux), and Vaudry (Paulin). There were 147 mentions.

The Société des Architectes Diplômés has celebrated by a banquet the admission of the thousandth member. M. Dujardin Beaumetz presided, and among a distinguished company were the Ambassador of

the United States and a representative of the President of the French Republic. The chief speaker was M. Bonnier, president of the society.

COMPETITIONS.

Water Supply Scheme, Alnwick.

Eighteen schemes were submitted in this competition, and that proposed by Messrs. Paterson and Nicholas, of Bradford, has been awarded the premium.

Carnegie Library, Clydebank.

Clydebank Town Council have agreed to appoint as assessor in this competition Mr. James Miller, of Glasgow, who was the architect of the Glasgow Municipal Buildings, who is to be consulted as to whether the competition shall be limited or open.

Trevor Estate.

The awards in this competition are announced as follows: First premium of £100, Messrs. Horace Field and Simmons and Mr. C. Farey, 1, Langham Chambers, W.; premiums of £60 each to Mr. W. G. Wilson, 5, Bloomsbury Mansions, W.C., and to an author whose identity has not yet been disclosed; premium of £30, Mr. Ernest Schaufelberg, 8, Manor Road, Richmond.

Llandrindod Pavilion.

The Llandrindod Wells Urban Council have considered the report of the assessor (Mr. W. Scott Deakin, of Shrewsbury) in reference to the competitive scheme for plans and specifications for the proposed pavilion on the recreation ground. The first premium went to Mr. W. Alec Millward (surveyor) and Mr. H. Moss (Bradford), the second to Mr. W. Beddoe Rees (Cardiff), and a special to Mr. A. Swash (Llandrindod Wells and Newport). The proposed expenditure is £5,000.

Queen Victoria Memorial, South Shields.

A meeting of the general committee of the Queen Victoria Memorial Fund at South Shields was held on February 8th. The town clerk read a report of the executive committee which had considered the various designs submitted. Two models were placed before the committee from which to make their final choice. They were those of Mr. Albert Toft, of London, and Mr. F. W. Doyle Jones, of West Hartlepool and London. After discussion it was decided to accept that of Mr. Albert Toft. The cost will be £1,000. The late Queen's statue will be 9 ft. in height, of bronze, upon a pedestal of Aberdeen granite 12 ft. in height. It will be placed in front of the Municipal Buildings.

LIST OF COMPETITIONS OPEN.

FEB. 28. SEWERAGE SCHEME, CORBRIDGE.—Schemes for sewerage and sewage disposal for the village of Corbridge are invited from duly qualified engineers. Particulars from M. Waugh, sanitary inspector, the Mount, Haydon Bridge, or from the Clerk to the Parochial Committee, E. Pearson, Corbridge.

MARCH 1. FREE LIBRARY, PENISTONE.—Competition limited to architects within thirty miles of Penistone.

MARCH 15. THEATRE AT SAN SALVADOR.—Particulars in our issue for October 20.

FEBRUARY 17—MARCH 24. STREET IMPROVEMENT, SWANSEA.—Architects are invited to submit competitive designs and

estimates for Castle Street improvement. Block plan and particulars on receipt of one guinea deposit, to be returned to competitors who fulfil the conditions. Premiums, not exceeding £250, for the architect appointed to prepare the working drawings; £50 to author of design placed second. Mr. J. S. Reay, F.R.I.B.A., has been appointed assessor. Applications were to be made by February 17th. Designs, March 24th, Town Clerk, Guildhall, Swansea.

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Prof. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 1. "OWEN JONES" COMPETITION FOR WALL-PAPER DESIGNS, etc. Designs to be submitted to the Board of Education by April 1. The competition is open to students in schools of design. Six prizes are awarded by the Society of Arts, John Street, Adelphi.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

DEVELOPMENTS AT ROSYTH.

The successful closing of the western coffer-dam at the Rosyth Naval Base opens the way for a new departure in the construction of the works. Pumping operations within the enclosed area in which the three graving docks are to be built are forthwith to be begun, and employment will be provided immediately for a larger staff of men than the 1,860 reported by the First Lord of the Admiralty in the House of Commons. Mr. McKenna has just made an arrangement with the Town Council of Dunfermline, which will hasten the building of the necessary sewage works and encourage the Corporation to proceed with the promotion of their Provisional Order for the extension of the burgh boundaries so as to include the Rosyth district. In giving this as yet practically unoccupied district the benefit of municipal lighting, watering, road-making, and maintenance, and in applying to its development the provisions of the Town Planning Act the Corporation will necessarily have an un-

remunerative outlay for some time, but the Admiralty, it is understood, are willing to bear the half of the annual outlay until assessable subjects make their appearance, and at the same time contribute nearly one-tenth of the cost of the new sewage works which are indispensable for the base.

RETAINING WALL EXPERIMENTS.

The lack of agreement between the usual theories concerning the pressure of earth on retaining walls and the actual pressures observed in experiments made with small rotating retaining boards recently led Professor William Cain to make a critical study of the subject. The results of his recent investigations, given in an elaborate paper in the January "Proceedings" of the American Society of Civil Engineers, indicate that the lack of harmony between theory and experiment is due to neglecting the influence of cohesion in practical formulas. This is expressed by the author as follows:

1. When wall friction and cohesion are included, the sliding-wedge theory is a reliable one, when the filling is a loosely aggregated granular material, for any height of wall.

2. For experimental walls, from 6 to 10 ft. high, and greater, backed by sand or any granular material possessing little cohesion, the influence of cohesion can be neglected in the analysis. Hence, further experiments should be made only on walls at least 6 ft., and preferably 10 ft. high.

3. The many experiments that have been made on retaining boards less than 1 ft. high have been analysed by their authors on the supposition that cohesion could be neglected. This hypothesis is so far from the truth that the deductions are very misleading.

4. As it is difficult to ascertain accurately the co-efficient of cohesion, and as it varies with the amount of moisture in the material, small models should be discarded altogether in future experiments, and attention should be confined to large ones. Such walls should be made as light, and with as wide a base, as possible. A triangular frame of wood on an unyielding foundation seems to meet the conditions for precise measurements.

5. The sliding-wedge theory, omitting cohesion but including wall friction, is a good practical one for the design of retaining walls backed by fresh earth, when a proper factor of safety is used.

TRADE AND CRAFT.

Odourless Closets.

The total suppression of "bad smells" from w.c.'s is a greatly desired consummation, and the Vento Syndicate, 12, Alford Street, Leeds, have, after much experiment, invented a special means of effecting this object. They employ an electric fan, which is usually fixed at the back of the basin, whence (the basin being specially constructed with a ventilation horn to which air-extraction piping is fitted) it instantly extracts all smell while the closet is being used; the foul air never being allowed to rise to the top of the basin. The fan requires only about as much electric current as an ordinary eight-candle-power lamp. It can be connected from any existing wires, and is only working while the seat is depressed by the user. The system should render specially welcome service in hotels, hydros, etc., where w.c.'s are in constant use, and where freedom from odour is a valuable business consideration, as well as an important sanitary safeguard.

A New Revolving Cowl.

A cowl of novel design, for which several important advantages are claimed, has been shown to us by a representative of Messrs. Horrell and Bowman, Moseley Road, and 33, Newhall Street, Birmingham, the patentees and manufacturers. The most distinctive feature of the cowl is that a free way is left in the flue pipe for the smoke and carbon deposits from the fire, and for the sweep's brush to come right through, the revolving apparatus being designed on a new principle, by which a clear passage is left for the smoke and for the sweep's brush. The cowl revolves on yellow metal wheels, which, working on aluminium bearings, are set at an angle that by careful experiment was found to be most convenient for the purpose, and are furnished with a knife-edge on the rim. They run round the outside of the flue-pipe. It will be seen from the accompanying sectional illustration that these wheels are carefully guarded from the weather by means of the top ring, and that all the working parts are beyond the reach of smoke, corrosion, or other clogging influences, and consequently remain sensitive to the slightest current of air; moreover they require no lubricant. The relative positions of the cowl and the wind

vane, and the instant responsiveness to every change, ensure a constant up-draught. The vane and top are of copper, the pipe being of cast-iron, while aluminium is judiciously introduced in positions for which it seems most appropriate. As the construction throughout appears to be sound in principle and execution, while the materials are eminently durable, the claim that the cowl is "practically indestructible" seems to be well founded. The cowls first fixed are found on careful examination to be in thorough working order, and in the best possible condition after more than six months' service. They are very easily and quickly fixed in position. We understand that the firm are willing to supply the cowls tentatively—that is to say, they would be willing to take back a cowl that might happen to be found unsuitable to the position to which it was assigned; so strong is their confidence in its efficacy in improving the suction of a chimney and overcoming the intolerable nuisance of a smoky grate.

FEDERATION NEWS.

Oldham and District.

The twenty-second annual general meeting of Oldham and District Master Builders' Association was held at Café Monico, Union Street, Oldham, on January 26th, Mr. F. Whittaker in the chair.

The secretary read the annual report, which was adopted, and the statement of accounts for the financial year was considered satisfactory and also adopted.

It was unanimously resolved that Mr. F. Whittaker (managing director of Messrs. Emanuel Whittaker, Ltd.) be elected president for the current year. A resolution was passed altering Rule 10 so as to provide for past presidents acting as ex-officio members at any and every meeting in connection with the association.

The question of adopting a new rule as follows was then considered:—"Members must not give 'whole' tenders for all branches of work in connection with any contract when separate tenders are also required from each or any branch trade." It was resolved, after full consideration, that the matter be deferred until next half-yearly meeting, but that in the meantime the matter be dealt with by the Executive Committee, and if possible the architects' views obtained. — COWPER AND DEAN, Secretaries.

Sheffield.

The annual meeting of Sheffield Master Builders' Association was held at the Builders' Exchange on February 8th, the president (Mr. Wm. Longden) in the chair.

Finance.—The annual report detailed the year's operations, and stated that the association, as a corporate body, had passed through the most successful year of its existence. Its finances stood at the highest point. The amount collected during the year for subscriptions was the highest on record, and although the association had made the largest contribution to the funds of the Yorkshire Federation, and had paid an extra sum on account of National Reserve Fund, in order to redeem its promise up to date, yet it had been possible to transfer from the income and expenditure account the largest surplus ever transferred in one year to the capital account, and to invest a further portion of its surplus funds. The capital account, as certified by the auditor's report, stood at nearly double the amount it did on Dec. 31st, 1907. The membership still continued to increase, and the relations with all the operatives' societies were of a most friendly nature.

Election of Officers. — Mr. Wm. Longden was unanimously re-elected as president, this being the only occasion, with one exception, that a president has held office for two years, since his father occupied the position in 1900. Mr. Chas. Boot was unanimously re-elected as vice-president, and Mr. A. T. Biggin as treasurer. For the twelve places on the committee, there were 19 nominations.

The monthly meeting of the association followed immediately on the annual meeting. One of the chief items considered was the question of payment for carrying tools from job to shop, when a man had been employed in some of the local works. The association agreed with the Operatives' Society that the carrying of tools constituted working time. The difficulty was that men were not allowed to leave works in time to take their tools to the yard by stopping time. Some members, however, pointed out that the works had allowed this time when the matter had been pointed out to them, and members were requested to communicate with the secretary in any case of difficulty. If a man's time were booked from leaving the shop to go to a job, it seemed only fair that the return journey should be equally treated. — THOS SMITH, Secretary.

Materials for Town Building.

WE may congratulate Mr. W. G. Newton on having contributed a very able and well-written paper to the Architectural Association on the thesis "that brick is eminently suitable for large town buildings"; a paper which shows that to his acquirements as an artist, recently displayed in his remarkable set of drawings submitted for the Tite

prize, he unites considerable literary ability. With some of his conclusions we should be disposed to agree; but the argument from ancient precedent is not very happy. Brick at all events does not seem to have been used in ancient times except when they could get nothing better. The remains of the Persian palaces of the Achaenidæ now stand as isolated columns and door-frames of stone, from between which the brick walls have disappeared. These, however, were probably unburned sun-dried bricks, and therefore doomed to destruction by time and weather. The Egyptians, in spite of one example of a brick pyramid quoted by Mr. Newton (the praise of which was evidently a piece of "brag" by a man who could not or would not go to the expense of stone), habitually used brick only for inferior utilitarian buildings. The Romans made splendid bricks, but they used them chiefly as a core for facing with marble or cement. Greek architecture, as it has come down to us, knows nothing of brick. Gothic architecture is almost exclusively masonic, except in some districts of North Germany and Holland, where stone was scarce, and materials for brick abundant. In short, no great building people who could command plenty of stone have ever been content to use brick for their important and monumental buildings.

The argument from precedent, therefore, goes for very little; and in any case it is beside the question. If brick is the best for modern town building under present conditions, we need not trouble as to whether it was thought so 2,000 years ago, and in a different climate from ours, and where the atmosphere of towns was not so clogged with chemical impurities as it is in most northern towns of the present day.

In regard to duration, under these unpropitious circumstances, there is no doubt a great deal to be said for brick. It is more weather-resisting and more fire-resisting than stone. And in regard to the question as between town and country, brick is better suited to the artificial conditions of towns, because it is itself an artificially prepared material, and we cannot agree with a speaker in the discussion who thought that brick was well enough in the country, though we required a more pompous material for town buildings. If there is a fairly good local building stone in any country district, one can hardly do better than use that, because a natural local material, even after being dressed for building, preserves a certain harmony of tone with the district out of which it is hewn. Therefore we say, if a house is to harmonise with the landscape, use local material where possible. But brick, even where there are local materials for it, is out of this category, because it is not a natural, but a cooked, material; "the smell of fire has passed on it."

So far, then, we may say that brick is better suited for town than for country architecture; but then comes the question, for what kind of town architecture? We cannot get over the fact that, for all its good practical qualities, brick can hardly be called a noble material. Even its weathering capacity is somewhat discounted by the fact that, owing to its rough texture, it catches and holds a great deal of the dirt of the town atmosphere, and becomes dingy and depressing in appearance. Portland stone, which seems on the whole to stand as well as brick, weathers in a much more agreeable and picturesque fashion. The President of the Association, though he summed up against the use of brick in towns in a general way, cited the Doge's palace as an example of its monumental use. It is curious how we have accustomed ourselves to accept that rather preposterous piece of architecture, and see nothing wrong in it, from mere habit, and its association with the most picturesque of cities. That beautiful arcade of the Doge's Palace was never intended to have anything built on it at all; the upper storeys of the palace were to have been erected on the second plane, as we may say, of the composition, behind the terrace. The erection of the brick wall with the chequer-work on it, upon the beautiful and delicate stone

STONE AND BRICK: A BUSINESS BUILDING IN NEW YORK.

THE MUSEUM AT DUBLIN: A BUILDING THAT COULD ONLY BE CARRIED OUT SATISFACTORILY IN STONE.

arcade, was a mere piece of utilitarianism carried out in order to get more floor space in the upper storeys. If it had been done in the present day it would have been called a piece of gross vandalism, and there would have been a public outcry about it.

No, brick is unquestionably not a material of the noblest kind, nor suitable to the most dignified type of building. Look at this illustration of the Dublin Museum, for instance; one which we have picked haphazard out of a heap of photographs as serving to illustrate the point. It may be said to be academic, but there can be no doubt that it is dignified; and can anyone possibly imagine that design carried out with the same dignified effect in brickwork? We feel some sympathy with the proposal by Mr. H. Hall in the discussion, that a future Minister of Fine Arts should have the duty of deciding whether stone should be used for a new building, or it should be relegated to the use of brick, as the inferior material; the speaker's theory being that no one should be allowed to use stone unless his design were worth it. But then we might add—should he be allowed to use brick, either, unless his design were worth it? And it must be remembered, too, that the two materials require a quite different kind of treatment. A brick building should never appear to be an attempt to do clumsily and with difficulty what could be better done in stone.

Brick, as Mr. Keen observed, requires an arched style; and in that sense the late Mr. Brooks's large brick churches were fine examples of the use of brick in obtaining large churches of a solid and massive character, at comparatively small cost. And we do not quite agree that buildings with arched openings are practically unsuited to city life, on account of deficiency of light. People are rather exacting and unreasonable, sometimes, in this matter of light; they are not content with having sufficient light as long as there is any more lighting space that

they *might* have, and think themselves aggrieved unless the wall is all window. Many rooms in modern offices are really over-windowed; but as long as a tenant sees part of his tight cut off by the spandrel of an arch he always fancies he wants that additional piece of window.

It is not, therefore, the necessity of arching, it is the want of architectural dignity in the material itself, which renders brick unsuitable for the most dignified, and monumental class of city buildings. But it may be very finely and effectively used in combination with stone, as presenting a contrast of texture and tone. We see this very effectively done in the Scotland Yard building, and the accompanying illustration of a business building in New York is another good example. This kind of broad contrast of surfaces is quite a different thing from the commonplace system called "brick, with stone dressings," which is essentially unarchitectural.

Of other possible materials for town building, we differ from the President of the Association in thinking that terracotta is much more associated with brickwork than with masonry; it is, in a sense, like brick, a cooked clay, and therefore a different class of material from either natural or artificial stone produced by pressure of the component materials. The danger of terracotta lies in the temptation it gives to over-exuberance of modelled detail, by which various important buildings have already been vitiated; and yet without that it hardly seems to have its *raison d'être*. Some of the washable materials with a glazed surface, which have been introduced of late years, have undoubtedly a hygienic value for cities, besides the quality of resisting atmospheric deterioration (at least we are led to expect this); but architects are not as a rule fond of glazed surfaces in buildings, though it must be admitted that a good deal remains to be done with the newer materials. Unpolished white marble, as in Mr. Belcher's building at the top of St. James's Street, is a new and very interesting experiment; nothing could look better and more dignified; how it will shape in the matter of duration, in the London atmosphere, time alone can show.

The combination of unpolished granite with brickwork, in opposed masses, is always effective. Polished marble opposed to ordinary building stone should offer a rather decided contrast of colour to be effective; in one or two recent instances we have noticed, the marble is too dull and uncertain in

A: Bricks 9 by 4½ by 2½ in English bond, 3 courses of stretchers to 1 of headers: 6 courses taking 31 bricks.

B: Bricks 12 by 6 by 2 in four courses of stretchers to 1 of headers: eight courses taking 32 bricks.

colour to be sufficiently effective as a contrast to the stone, and might even be passed over unnoticed. And marble courses introduced in stonework should not be of a strongly marked or mottled marble, as in that case the marking interferes (to the eye) with the clean and precisely cut line of demarcation which there should be between the marble and the stone courses.

To return again to brick, we may add that there would be a much better effect in brick buildings if we could ever get the standard size of brick altered to a thinner and longer shape. Whenever a thinner brick is proposed there is the economic objection that it involves greater expense in building, from increasing the amount of bricklaying. But this would be hardly appreciable if the lateral size of the brick were somewhat enlarged at the same time that the thickness is reduced. The accompanying diagram shows on the left six courses of standard brickwork, which in the space given takes 31 bricks (counting in those which only come partly into the diagram) in a height of $16\frac{1}{2}$ inches; we are purposely omitting consideration of the thickness of the mortar joints, which is variable, and does not affect the comparison. On the right hand is shown eight courses of bricks 12in. by 6in. by 2in., which takes 32 bricks in a height of sixteen inches. Thus this makes hardly more bricklaying in the same space of wall, nor are the separate bricks much heavier or any more inconvenient to handle than the standard brick; and it would make a far finer-looking wall; moreover, the 12-inch wall might be efficient where a 9-inch wall is not. Of course it would require something even more drastic than an Act of Parliament—something

akin to a revolution—to bring about a change in the shape and size of anything so sacred as the household brick; but it is worth while pointing out that it is not, after all, the best of all possible bricks.

The Forthcoming Building Exhibition.

THE ninth biennial Building Trades Exhibition will be opened at Olympia, Addison Road, Kensington, S.W., on Saturday, April 22nd, by Mr. Leonard Stokes, President of the Royal Institute of British Architects, and will remain open until May 6th. The exhibition, organised by Messrs. H. Greville Montgomery and Mr. Hugh C. Montgomery, is held every other year; and probably there is not another exhibition of any kind which can so successfully fill the huge building at Addison Road—main hall, annexe, and galleries—from end to end with exhibits strictly pertaining to the industry immediately concerned. As before, the galleries will comprise a municipal section for the special benefit of borough surveyors and engineers; whilst the whole of the ground floor is devoted to the multifarious requirements of the architect and builder. The wall which used to separate the main hall from the annexe has recently been removed, the result being that the stands will run continuously from the entrance in Addison Road to the exit in Blythe Road. Arrangements are being completed for official visits of numbers of the many associations and societies connected with the building industry, and in view of the improved prospects for trade, there is every reason for confidence that the Exhibition of 1911

A BRICK CHÂTEAU IN BELGIUM.

will be even more successful than those of former years. It will of course, as before, be specially and adequately treated in this Journal.

The keynote of any exhibition is—Concentration. The value of the principle was no doubt in some respects greater in the days when the means of transit were primitive, and when frequent fairs, wakes, and bazaars were necessary for the expansion of industry. They found their highest development in the world-famous fair of Nijni-Novgorod, which was at one time an event of supreme influence on the world's commerce. That the great Exhibition of 1851 was but a better organised extension of the ancient system of fairs is recognised by calling some of its successors "World's Fairs." Exhibitions of the World's Fair order are doubtless incalculably useful in promoting business and spreading information; they both gather and scatter. But there is a sense in which they are obviously inferior in concentrative force to their legitimate offspring, the trade exhibition. At an exhibition like that which has been for so many years successfully organised by Mr. H. Greville Montgomery and Mr. Hugh C. Montgomery for the building industry, concentration is respected to the fullest possible extent. Nothing extraneous is admitted, and it may be assumed that the bulk of the visitors have a keenly practical interest in the objects collected in such large numbers from the four corners of the kingdom. The Building Exhibition affords to traders an invaluable opportunity for the concentration of their goods, and to professional men a most convenient means of inspecting them. The vendors, the goods, and the prospective customers are concentrated for a given period at an accessible place. Nor is the exhibition merely a valuable device for effecting thus much of mutual advantage. It is a social as well as a business rendezvous, bringing about many enjoyable meetings of old friends, who, scattered as widely as the various goods on show, come together as rarely, and are grateful for the periodical provision of a rallying ground where business and pleasure may be blended.

R.I.B.A. Prizes and Studentships, 1912.

IN the list of R.I.B.A. prizes and studentships, 1912, the special subjects for competition are announced as follows: The subject for the Essay is "The Principles to be observed in Designing and Laying-out Towns treated from the Architectural Standpoint." The Soane Medallion is offered for the best design for a guildhall of monumental character. The subject for the Tite Prize is "the best design, according to the methods of Palladio, Vignola, Wren, or Chambers, for the Central Courtyard of a Royal Exchange, covered with a Roof." The Grissell is offered for "the best design for an isolated exhibition building of fire-resisting construction, suitable for a temporary picture gallery, in the grounds of an exhibition held in London." Full particulars of the other prizes and studentships are given in the list, for which application should be made to 9, Conduit Street, W.

The Streets of Rome.

IT appears that the municipality of Rome have allowed the streets of the Eternal City to get into such a disgraceful state that a phalanx of members of the Chamber of Deputies have called on the Government to interfere and compel the municipality to do their duty. It is stated that there is hardly a street in Rome which has not, during the last three months, been "up" from end to end, and then left unpaved and encumbered with *débris*. The call for Government interference in such a matter is an almost unprecedented event, and leads to the conclusion that things must have come to a very bad pass before such an appeal was made. But it is perhaps a precedent worth considering. We have frequent complaints in London that streets are taken up exactly at the times when the operation causes the greatest public inconvenience. Perhaps a little Government pressure might be useful in own case.

New Light on Abbotsford.

THE recent death of Miss Smith, of Darnick, was made the occasion of an interesting communication to the "Scotsman," with reference to the building of Abbotsford. Miss Smith's father, it appears, was one of the builders of Abbotsford. The brothers Smith were, it is stated, accomplished architects, one of them—the recently deceased lady's father—being "considered by some to have a touch of genius," and they would not, as a rule, brook any interference with their designs. Sir Walter, however, who desired to be his own architect, greatly wanted the co-operation of the brothers, who, out of admiration for the genius and affection for the man, consented to humour his whim, and to build, for once in a way, from designs for which they were not altogether responsible. Their reluctance to assume the responsibility of building under Scott's supervision is traditional in the family, but, it is believed, has not been previously recorded. It might, however, have been very naturally assumed; for Scott, with his wealth of historical knowledge, and his highly imaginative mind, must have seemed a phenomenally formidable client.

Royal Institution Lectures.

ON Saturday last, Mr. T. G. Jackson concluded his series of lectures on Byzantine and Romanesque architecture, dealing in this lecture with Romanesque in France and England. He described at the outset the high state of culture in Gallo-Roman society in the fifth century, mentioning especially Sidonius Apollinaris, and his account of a church at Lyons, of which relics remain. Southern France was full of Roman remains, which exercised a great influence on the architecture of the period; but French Romanesque acquired no general style, but fell into distinct styles in different provinces. St. Front, at Périgueux, was a direct imitation of St. Mark's, but otherwise the churches of Western France represented a combination of domed structure with the Basilican plan. Provence was very strongly influenced by Roman remains, but showed no element of a progressive style. Burgundy, which was the centre of the monastic movement, though also strongly influenced by Classic example, showed much more progressive tendency in the direction which ultimately led to the development of the Gothic style, the Abbey at Vézelay being a remarkable instance of this. In England, the Romans, who had been there for several centuries, must have left a great many buildings behind them, and the country was full of large Roman villas, some of the remains of which suggested that their architects had modified the Roman house plan in order to suit the new conditions of climate. Saxon architecture was obviously based on rude attempts to imitate Roman work. The Romanesque style of Normandy came over into England with Edward the Confessor; but the great impulse was given to it with the extensive Norman church-building which set in after the Conquest, and had left its mark everywhere among our cathedrals and churches. There was little ornament in the early Norman buildings in England; what sculpture was attempted was exceedingly bad; but there was an undeniable grandeur about much of this massive and simple building. The later Norman architecture in England showed, however, a great improvement in delicacy and refinement of detail. The period of architecture which they had been considering would perhaps not appeal to all; those who were wedded to Classic tradition and conventional rules would no doubt regard it as more or less barbarous; but it was a period of the greatest interest in regard to the development of architectural style, and prepared the way for the great achievements of complete Mediæval architecture. The concluding lecture, which was very largely illustrated, was somewhat better attended than the other two. If the lectures should be published in a more permanent form they will be very useful as an historic summary of the period with which they deal, and it is to be hoped that they will be made thus available.

IN PRAISE OF BRICKWORK.

BY W. G. NEWTON.

In a paper read before the Architectural Association on February 20th, Mr. W. G. Newton put forward the proposition "That Brick is eminently suitable for town buildings," claiming that brick is more durable than natural materials, and that brickwork may be rendered beautiful.

THE great Central Asiatic civilisations built with brick. Herodotus's account of the building of Babylon, with its kiln-burnt bricks, can be verified to-day. The Palace of the Kings, also, which remains even to this day as a square of 700 yards in length and breadth, is a great "pile of brickwork, chiefly of the finest kind." No less do modern travellers find half sunk in the drifting sand on the Afghan frontiers of Persia the brick walls and domes and tombs of cities of a thousand years ago. The bricks at Zaidan are partly sun-dried and partly kiln-burnt. Probably they were all covered originally with mud or stucco; perhaps painted in bright colours, like the seven walls of Ecbatana.

Egypt.

"The use of crude brick," says Canon Rawlinson, "was general in Egypt for dwelling-houses, tombs, and ordinary buildings, the walls of towns, fortresses, and the sacred enclosures of temples. Even some small ancient temples were of crude bricks." And Herodotus tells us that the King Asychis, "desirous of eclipsing all his predecessors on the throne, left as a monument of his reign a pyramid of brick. It bears an inscription cut in stone, which runs thus:—'Despise me not in comparison with the stone pyramids; for I surpass them all as much as Zeus surpasses the other gods.'" It was built of bricks made from lake mud.

Athens.

Athens after the battle of Salamis was largely built of sun-dried bricks, as we may infer from the fact that Themistocles' hurriedly built city walls were of this material (except the lowest 4ft.), and that for these walls private houses and public buildings were recklessly demolished. But the Greeks seem to have been in the habit of covering their brick walls with a fine hard stucco made of marble dust. So fine and good was this that, Vitruvius tells us, the Romans of his day would use slabs of it, cut from old Greek walls, as tops for tables or sideboards.

Rome.

The only brick familiar to Vitruvius would seem to have been the sun-dried brick. Vitruvius describes three kinds of brick as generally used in his day. Two kinds are square. They are Greek, and are respectively 4 and 5 palms in length. The smaller were used for private buildings, the larger for public. The third kind is the Roman brick, and oblong. For an unexplained reason it is called the "Lydian."

But, after all, Vitruvius was dead before Roman architecture began—the architecture of brick and concrete which the legions were to carry with them to the Euphrates, the Rhine, the Forth. And the Roman brick, which Vitruvius had hardly seen, is familiar to the least erudite country parson.

Early English Brick-making.

It was for long the accepted theory that no buildings were built of brick from the time of the Roman occupation until the reign of Henry VI. There is on record the express statement of the inhabitants of London that down to the reign of Stephen their houses were built of wood and thatch. There is no documentary

evidence of brick building of an early date. And there is not to be found in England a building earlier than the last half of the thirteenth century of which the material is a brick which can be definitely pronounced to be other than Roman.

Yet it seems to be highly improbable that so simple and useful an art as that of brickmaking should ever have been lost. The necessity of providing tiles would surely have preserved the art of making them, and bricks are not more difficult. And as early as the year 1189 a series of disastrous fires had roused the citizens of London to seek for some method of protecting their mud walls and thatch, and one of their expedients was a close-set covering of tiles.

It seems, then, reasonable to suggest that the practice of brick-making in England, once initiated by the Roman settlers, never died, though in the cause of centuries the type degenerated.

The Spirit of the Brick Builders.

With the growth of a strong central Government, man dared to leave walled towns and live alone. Castles were turned into homes, and there rose something which the world had never seen before, the English manor-house. That was a period of the greatest significance to the student of brick architecture, a time of the building of East Barsham and Layer Marney, Sutton Place and Bramhill.

Question of Plastered Bricks.

It would, indeed, almost seem that it was only in the seventeenth century that it began to be considered normal to rely on the texture and colour of the material, and to build in bare brick. The author doubted whether it was generally realised how far mediæval buildings were covered with plaster or whitewash. He thought that there was little doubt that Hengrave and East Barsham Manor (to take two examples) were covered with whitewash or plaster, and possibly enlivened with gold and colour. Many names of places, such as Whitechapel, add force to the suggestion.

Is Endurance Wanted?

"Architecture aims at eternity," writes Sir Christopher Wren; and if this is so, the primary qualities of the material are important. We have, then, from the point of view of permanence, to compare brick with other materials—stone, concrete, and steel. Of these, exposed concrete would not withstand the action of frost, and exposed steelwork would have to be protected from the weather. And both these materials conduct noise and changes of temperature too easily to be by themselves a good material for town building. We seem to be reduced in any case to a comparison of the merits of brick and stone.

Decay of Building Stones.

(a) In General.

1. Chemical Agencies.—Ordinary rain-water, owing to the presence of carbon dioxide, can affect the felspar of granite and the calcium of limestones. Of itself this action is slight, amounting to less than a millimetre in a century. But when rain falls through air which is loaded daily with 980,000lb. of sulphur it is as if we were to syringe our buildings with sulphuric acid. Snow carries a higher per-

centage of injurious substances than rain-water. And the unburnt carbon particles from our coal fires act again as distributing agents of corrosive acids.

2. Mechanical Agencies.—Among mechanical agencies of decay must be numbered organic deposits, either decaying organic matter in the form of blown dust or living organisms, lichens, and so forth. Wind and friction are two other mechanical agents; but the most important is change of temperature. This particularly attacks the crystalline stones. And the expansive power of water freezing in a confined space amounts to a pressure of 138 tons per square foot.

(b) In Detail.

How do the various building stones stand these agents of destruction?

1. Limestone.—It is the carbonate of lime which decays under atmospheric acid; while the more crystalline limestones cannot withstand frost.

2. Sandstones.—Sandstones are attacked in the cementing matrix, which is either of a clay or a lime nature.

3. Igneous Rocks.—These, if fresh, are hardly liable to chemical decay. But they yield readily to the mechanical action of frost. Cleopatra's Needle, which could keep the sharpness of its inscriptions for 2,000 years in Egypt, has had to be treated with preservatives.

All around us is decay. London is mouldering away. And not London alone. The Clarendon Buildings at Oxford and the St. Aldate's face of Christ Church have been rebuilt in the last four years. And the air of Manchester contains twice as much acid as that of London. There is perhaps now not a stone of the Abbey which is as old as the day it was built. You cannot rebuild a masterpiece, even piece by piece, without making the whole hard and self-conscious.

And yet there is to our hand a material which can be made impervious to frost and to atmosphere. "The earth about London," Wren says in a letter to a friend who was on Queen Anne's Commission for the Building of Fifty New London Churches—"the earth about London, rightly managed, will yield as good a brick as were the Roman bricks, and will endure in our air beyond any stone our island affords."

Design in Brick.

But endurance is not all we are looking for. How far does material affect the building's appeal to the heart? And what qualities are peculiar to brick or to stone? The question before us is how far brick is a suitable material for large town buildings. And we have seen that this practically resolves itself into a question, so far as surface matter is concerned, between brick and stone. The use of concrete or of steel exposed is not general enough to warrant serious examination, though I may perhaps in passing quote from Mr. Fergusson's "History of Modern Architecture" the passage where he is discussing the newly built Crystal Palace. "Though stone," he says, "may be inappropriate, brick and terra-cotta may be employed with iron and glass with the very best effect. When so used the brickwork must be of the very best quality, so as to be pleasing in itself. Coloured bricks should be employed everywhere to give relief and lightness."

It is, then, a question between brick and stone. Let us take a brief survey of stone as a material of design.

Design in Stone.

(1) General.

There are two ways to build with stone. The one is to build with small stones, as

did the mediæval builders; the other is to build with the largest stones we can get, as did the Mediterranean civilisations, whose heirs we are. Of these, the former almost merges into brickwork; indeed, many of the Gothic revivalists acknowledged this by their work, as may be seen in a walk round the London churches built by Street, Pearson, or Butterfield. At the same time, such mediæval work has the essential difference of carved ornament where stone must be used. The ornament of brickwork is essentially either moulded or a patterned arrangement of bricks.

The fourteenth century innocence which chisels the brick niches of Beverley Bar, no less than the delicate Renaissance skill which carves the Cupid's heads in rubbed brickwork of the Enfield House (now in the Victoria and Albert Museum emphasises the truth that carving should be on stone.

(2) Details.

But there are many to whom the abstract logic of design will not appeal. To them the author would suggest that our use of Roman and Greek mouldings is hardly defensible. We use shapes that were de-

signed to give an effect of glowing depth or stark delicacy under a searching sun; and we deliver them over to our weather, to wash them unevenly with its rain, to scour them unevenly with its south-west wind, to paint them unevenly with the velvet black of its carbon. If we are going to build in stone, ought we not to take account of all this, to arrange our angles and to design our mouldings so that the rain and wind may burnish those parts which we want white, and the smoke paint here and there a darkness which no Greek temple could attain? This would ask an

ANDREW N. PRENTICE, ARCH.

These extensive alterations and additions to Notgrove Manor, Gloucestershire, have been carried out for Mr. Cunard from designs by Mr. Andrew N. Prentice, F.R.I.B.A. The plans show the new work hatched.

amount of logical thought and experimental study, and perhaps the result would be theatrical. At least it would only be suited to something monumental, some great tomb or bridge or gateway.

Zeitgeist.

But we live in an equable and kindly, rather than a monumental, age. What are the large buildings we build in towns? Not a Pantheon, rarely a cathedral; even Newgate Prison is gone. For us, large town buildings are offices and banks, flats and elementary schools, theatres and fire-stations, town halls and public libraries. It is the immensity of our towns that is monumental. No one can have looked down unmoved upon Birmingham from the G.W.R. embankment. And the author felt strongly that the note we have to strike is not a note of art and grandeur. We live in our great modern cities as our ancestors lived in the great forests. You cannot walk down Tooley Street or look over the endless roofs of Tottenham without feeling rather frightened. Our cities are great. Cannot we make them less terrible? There is a gracious homeliness about brickwork—what Charles Lamb calls “a cheerful, liberal look.” We feel it in the Temple, in Gray’s Inn, in Westminster. The author would be less frightened of calling on the King in St. James’s than in Buckingham Palace. Who does not long more than ever now to be a fireman, to live in those pleasant brick fire-stations? St. Benet’s, in Threadneedle Street, would stay his Sunday morning steps rather than St. Mary-le-Bow.

For our theatres and palaces of commerce we may use glazed bricks, beautiful as a de Morgan tile, and imperishable. We may use salted bricks, or rubbed bricks, which laugh at acids; we may fill our palette with red from Fareham, with blue from Staffordshire, with white from Suffolk, or with the rose and purple of the weathered London stock. Texture, no less than colour, is ours. With glazed bricks and rubbed bricks, with recessed joints and lime cream, and with all the varieties of bond, what may a clever man not achieve?

Conclusion.

It was, then, on three grounds that the author based the claim of brickwork in town building. Historically we see that the great building ages have not disdained it; it is essentially an English material in that it was being used most surely and most vividly just when the English genius, cut off from Italy, France, and Spain, was most surely itself. Chemically, we see that we can, by processes of manufacture, by selection of material, by careful burning, perhaps by glazing, produce something more enduring than Nature gives us. Most important of all, brickwork, in the hand of a master, may have a serenity and a kindliness which our great towns so conspicuously lack.

Discussion.

Mr. Alan Snow, opening the debate, said that geometrical planning, with its angles, long lines, and curves, required geometrical elevations, depending for their effect upon continuous horizontal lines, such as string-courses, cornices, etc., perhaps varied, but to a very limited extent, by gables, or a small group of vertical lines. It was not possible in brickwork to ensure that these lines should be strongly enough marked, sharply enough defined; they lost themselves too soon in the distance. Neither was it possible to give to the projections the boldness, and to the enrichments the clear cut expression, that was necessary for the attainment of true dignity and beauty.

Suppose we built our town building six or seven storeys high and several hundred feet long, entirely and naturally of brick. What was it going to look like? Perhaps we might rely on texture and beautiful colour. Warmth of colour and variety of texture were the distinctive qualities of good brickwork, but these same qualities, which were amongst the chief reasons for the revival of brickbuilding in our country work, could not be relied upon in our large towns. The brick was either a hard and repellent material, or its surface made of it a natural collector of soot and dust, which were inevitably present in all large towns, and which adhered to the brickwork and in time became ingrained in it, and our once beautiful piece of colour became dull and of a drab monotony. The dull surface which bricks so rapidly assumed was incapable of reflecting light, and, indeed, might be said to absorb it. Large town architecture required a larger treatment than brick would allow of; the best possible effect must be aimed at, and would not be obtained by the use of brick. In conclusion, he maintained that brick was not an eminently suitable material for large town buildings, because with it the necessary and proper effects for town architecture could not be achieved.

Mr. H. F. Murrell said that Mr. Newton’s appeal to history was not very fortunate. The Egyptians concealed their brickwork, the Greeks covered theirs with stucco, and the Romans buried theirs in stonework. Speaking with regard to the use of brickwork in cities, was it quite dignified, asked the speaker, for a large town building to have to undergo the periodical process known as “rake out and point”? Something different from that homely spirit which Mr. Newton desired was, he thought, wanted in our great civic buildings.

Mr. G. Fildes (son of Sir Luke Fildes, R.A.), cited the Campanile of St. Mark’s, Venice, as a brick building in a town. The raking-out and re-pointing of bricks was no greater an indignity than the cutting-out of portions of shaled-off ashlar from buildings like the Horse Guards, and many others. In both cases they were simply necessary reparations. Alluding to an observation by Mr. Snow, the speaker said the French used reinforced concrete because they had no brick. Mr. Newton, he thought, had substantially proved his point.

Mr. Herbert Hall said a man had no right to use stone unless he had a good design; and if ever a Minister of Fine Arts came into being, he should have the power to say whether a building should be erected in brick or in stone. Then, whenever they saw a brick building, they would know that the architect was in disgrace, and was not allowed to use Portland stone. The country was eminently suited to brick buildings, and there it was natural to provide an unobtrusive material. But in the towns one wanted to assert oneself, and accordingly used a pompous material like stone. The speaker objected to the use of brick and stone in conjunction, and disliked the practice of enclosing stone panels with a brickwork frame. Stone was a noble material for noble purposes.

Mr. D. A. Forster said he disagreed with those who stated that brick lacked boldness of appearance. There was a good deal of boldness, for instance, in the Prudential building in Holborn. One important consideration in connection with brick had been overlooked, and that was its fire-resisting qualities. For this purpose there was no better material than brick.

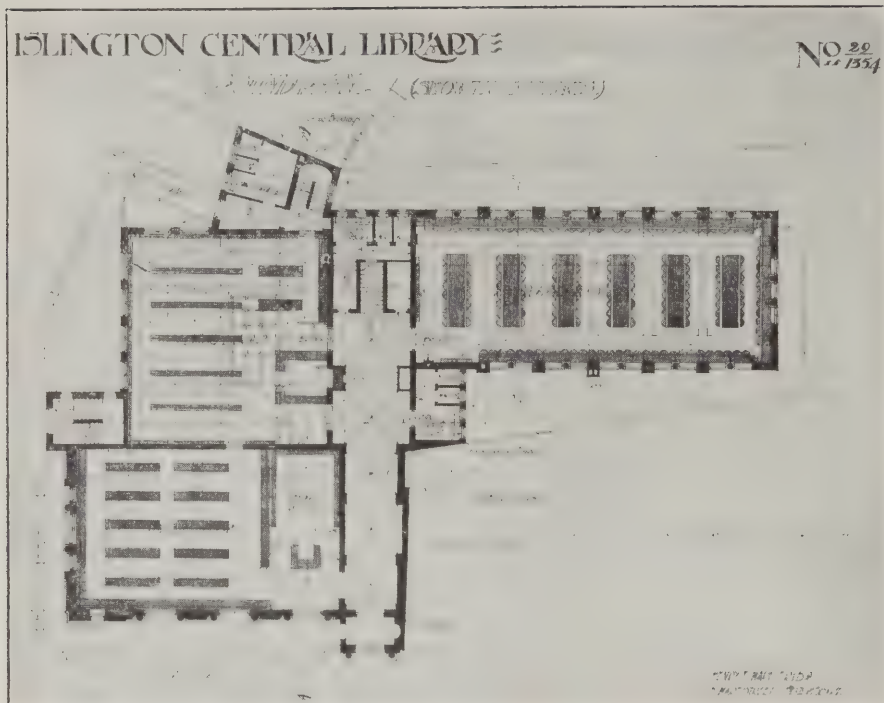

Mr. V. R. Talvalker mentioned many examples of brick buildings, and said that stone, in comparison with brick, was six times as costly.

Mr. Arthur Keen, having alluded to the pleasure it gave him to see the son of his old friend and colleague taking an active part in the work of the Association, took exception to the classification of terra-cotta with brick. Terra-cotta, so far as architectural expression went, partook more of the nature of stone. The subject under discussion should, he thought, have been argued from the architectural standpoint. Horizontal, not vertical, lines were wanted in towns, and they could not be obtained in brick. Leicester Town Hall was a most successful brick building, but a great deal of stone was included in the design. A great deal of the charm of stone building depended upon the accidental effects of weather and smoke. St. Benet’s, to which Mr. Newton had referred, was not exactly an architectural building. St. Mary Abchurch was homely and domestic, but was not treated in a strict architectural way. The body of St. Mary-le-Bow was of brick, and, though of homely character, hardly seemed to agree with one’s idea of city architecture. The Doge’s Palace seemed monumental and effective in brick—its parts were large and broad. The correct treatment of brick was arched construction, but this was unsuitable in towns. The consequent loss of light was, he thought, a strong argument against the use of brick.

Mr. Newton, in reply, and with reference to Mr. Keen’s remark concerning the atmospheric effects upon stone, enquired what would the shade of Sir Christopher Wren think of such a statement? With regard to St. Benet’s, it seemed to him that any building which could stir emotion was an architectural building. The note of serenity and kindliness was, he concluded, much wanted in towns.

A BISHOP’S HINTS TO ARCHITECTS.

In an address to the Birmingham Architectural Association at the Exchange Buildings, last week, the Bishop of Birmingham (Dr Gore) called attention to what, in his view, are anomalies and archaisms in modern church construction from the point of view of worship in the Church of England. “Constantly, when I go to churches,” he said, “I find myself required to stand on a ledge so narrow that I am continually obliged to recall myself from that absorption of mind in higher things which ought to be my privilege in order not to tumble off.” And again: “It appears to me incredible, but it is true, that in a great number of churches communicants are made to kneel on a lower level than the person who is to administer the cup to them. And a high rail is intruded. The result is that at the most solemn moment, when you want them to be thinking about nothing except the spiritual meaning of the act they are engaged upon, and when you yourself want to be able to perform what is an exceedingly solemn act, with a totally free and disengaged mind, you are entirely occupied in trying to insert the cup in between a lofty rail—very likely with spikes of some kind—and under the rim of a large hat, and it is a tormenting process.” The primary necessity, Dr. Gore explained, was that they should put the people, if possible, to kneel a little higher than the space which was within the rail. At least the communicants

should kneel on the same level and the rail should be so low as not to be an obstacle. Having admitted that there had been great improvements in the arrangement of pulpits since the time when the rostrum was furnished with a cushion, and the glare of the gas jets, one on either side, hid the congregation from the preacher, the Bishop spoke of the place and function of windows in churches. English churches they wanted light, and they wanted a complete reconsideration of what was to be expected of stained glass windows. These should not obscure the light and make the place dark; they should colour the light while they admitted it. In a vast number of cases they defeated the object of a window, especially in such a climate as ours, and having regard to the need of the church. Passing to another matter, Dr. Gore, as one who had frequently to take his place in the sanctuary of a church, complained that a marble floor was a chilly thing to stand on, in our climate. He asked architects to consider whether such a material was not quite unsuitable as a paving in this country. Of course in Italy and Spain, with their great wealth of light, a marble surface was a delightful thing.

Another problem the speaker asked his audience to solve was how to make the seating in a church fill the minimum space so as to let the congregation be as numerous as possible, and at the same time to make it reasonably possible to sit and kneel without distortion. At Westminster Abbey, for instance, sitting was rather painful, but kneeling was a process of physical gymnastics which could be accomplished only by the most agile. The Bishop went on to contrast the monastic ideal which lingered on in the construction of churches, as when the choir was screened off or hedged in, with the ideal represented in the earliest Christian churches, when the whole congregation, and not the choir or any one part of it, was the consecrated body. It was the earlier, the congregational ideal, he said, they ought to try and build for. Looking at a modern church, one might ask: "I wonder why these boys and choir men are selected for this extraordinary seclusion.

I never heard that they are particularly holy or anything of that kind." There was a good deal to be said for the choir being in the middle of the church; from the point of view of their leading the congregation there was very little to be said for their being shut up behind screens in a narrow choir.

Bishop Gore protested against the way in which the font was relegated to "a muggy little corner," in the dim obscurity of which, after stumbling over a good many hassocks, one might discern it. Finally, speaking of church decorations, he expressed the view that it would be an advantage if much of the brass-work inserted in recent times were utterly cast out. It had been such as it was very difficult to find language adequately to describe. There should be attached to every church its architect's design for its gradual beautification or decoration, and he would attach as a sort of bribe, that it should be unnecessary to obtain a faculty when the decoration was in accordance with the architect's design. If that principle were once established they would get rid of what was at present a grave disaster, namely, that every individual who wished to put up a memorial "goes off to an architect or designer and gets the thing drawn out; then comes with it and says, 'I want to put this up,' and considers himself aggrieved or offended in his tenderest susceptibilities unless he is allowed to put it up." Unless the churches were going to be ugly, monstrous, and offensive in their decoration, they must put an end to that kind of arbitrary treatment of them.

OUR PLATE.

Mr. Henry T. Hare's design for the Islington Central Library, which forms the subject of our centre plate this week, was awarded the first premium by the assessor, Mr. John Belcher, R.A., in the competition held in 1905. The site is at the junction of Holloway Road and Fieldway, the back part extending about roof, along the rear of the houses facing the former road. The entrance is placed in

Holloway Road, next to the adjoining property, and a corridor 12ft. wide leads to the principal rooms and to the staircase. The building is faced with Portland stone, and the floors are fireproof throughout. Heating is by low-pressure hot water, and the joinery and fittings are of wainscot. The library is conducted on the "open access" system, with attendants' enclosure and radiating cases.

BUILDERS' FOREMEN AND CLERKS OF WORKS' DINNER.

The twenty-sixth annual dinner of the Provident Institution of Builders' Foremen and Clerks of Works was held at the King's Hall, Holborn Restaurant, on Saturday last, February 25th. At the conclusion of the dinner, the usual loyal toast having been honoured,

The Chairman (Mr. Thos. Holloway) proposing the toast of "The Institution," said, with respect to the building trade, there were some buildings they hurried through as quickly as possible, and others over which they delighted to linger, and having mentioned, in the course of some further remarks, that his birthday coincided, at a later date, with that of Sir Christopher Wren, the speaker urged non-members to join the Institution. Subscriptions were from 5s. upwards.

Mr. John Beer, corresponding secretary, responding, said there were about 800 builders in London; and if each would contribute £1 the Institution would be relieved of all financial anxiety.

Mr. Fredk. Higgs then proposed the toast, "The Architects and Surveyors," to which Mr. J. J. Joass (for the architects) and Mr. H. Northcroft (for the surveyors) ably responded.

Mr. H. D. Blake proposed the toast, "The Builders and Contractors," to which Mr. Leonard Horner, replying, expressed his satisfaction that the depression which had so long overhung the building trade showed signs of passing away. He concluded with a sympathetic reference to the late Mr. Howard Colls.

Mr. Alexander Ritchie, proposing the toast, "The Governor, Trustees, Donors, Subscribers, and Visitors," alluded to his early friendship with the brothers Holloway, and to the important position which they held in the building trade. The late Mr. Howard Colls, said the speaker, was a giant among builders and among men.

Mr. Ben Carter responded to the toast.

Mr. Ernest Searchfield (Financial Secretary) then announced that the evening's donations towards the Institution's funds amounted to £463 2s., a record collection. The total included a gift of £26 5s. from Messrs. Holloway Bros., and a like sum from Mr. Thos. Holloway as a personal contribution. No fewer than 655 diners, continued the speaker, had been accommodated that evening. He apologised for any inconvenience that might have been experienced; but it was almost inevitable with such a large company.

Mr. T. N. Yule, proposing the toast, "The Chairman," observed that it was the second time on which the chair had been filled by a member of the Holloway family, Mr. Henry Holloway being the former chairman. Everybody knew the Chairman for a modest and unassuming man.

Mr. Thos. Holloway, in the course of a brief response, expressed his very great pleasure in fulfilling the various duties of office.

CORRESPONDENCE.

Architect, Builder, and Specialist.
To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Master builders and building contractors must have read with very deep interest the speech of Mr. Macfarlane at Manchester, reported in your issue of February 22nd under the heading "The Architect, the Builder, and the Specialist."

The three branches named, to-day carry the trade upon their shoulders. The art and industry of building should be limited to the two great branches represented by the architect and the builder. The specialist is the outcome of the architect's, no less than the builder's, not being up-to-date: cause and effect in that respect are too often confused. As a "man in the street," who is neither an architect nor a builder, but yet loves design and appreciates good building, the writer was tempted, in speaking to the question of a fair form of contract at the last meeting of the National Federation of Building Trades Employers, to draw attention to the great necessity for education among those whose interests and existence were so largely dependent upon being up-to-date. It is the want of education on the part of those interested which heralds the advent of the specialist, and even calls for it; and while architects and master builders no doubt continue to advance the professional and commercial side of their profession or art too often independently, instead of advancing hand in hand, the specialist strides on ahead, and leaves both those branches behind, and in many cases obviates the necessity for the services of either. A due appreciation of the amenities of the trade by the architect and builder does to some extent hold the specialist in check, but these two branches have still to contend with that modern fetish, the pursuit of cheapness, a mistake into which the younger generation are too ready to plunge, in the belief that if it does not lead to lasting greatness, it pays. Experience teaches otherwise. My object in dotting Mr. Macfarlane's "i's" and crossing his "t's" is to endeavour to supplement the efforts of so many others who have been and are so hard at work

in seeking to bring home to members of the trade the necessity of familiarising themselves with the immediate demands of the day upon their trade. It is imperative for the master builder to take his due share in civic administration and social life, to attend conferences of persons interested in improving housing conditions—who are heralds of events though dubbed as cranks—and if need be, steal from them Jove's thunder; to see that the younger generation, who are often themselves the sons of professional men and builders, are imbued with "right" ideas at the outset, and that they enter upon their calling thoroughly educated and up-to-date.

Unfortunately, the retired butcher, baker, grocer, and tailor, for many years have too often launched out into speculative building without any qualifications or fitness, and have thereby brought house building on the so-much-per-foot-run basis into disrepute; but is not the architect (who advises the estate owner) with his so-many-to-the-acre-repeat plans equally to blame for fostering conditions which permit such excrescences of the trade?

What am I driving at? The question may well be hurled at me by the practical and hard-headed master builder. My answer is short. Educate! Educate!! Educate!!! Among other things, as a lawyer, may I say, learn to read a form of contract, even upside down, if not to interpret it legally.

W. H. HOPE,
Secretary Northern Counties Federation of Building Trade Employers.

The Board of Trade London Traffic Report.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR, — With reference to the leading article in your issue of February 22nd, under the above caption, and more especially to the quotation from the report on page 189: "the open ground to the south of Wormwood Scrubs, now occupied by Exhibition buildings, comes nearer to the city than any other vacant space within the County of London, and presents an opportunity for forming a good western outlet which should on no account be lost,"

I venture to point out that, pending the construction of the proposed Western Avenue, great relief could be given at small cost by extending Ducane Road about a quarter of a mile across open fields to Old Oak Lane, as indicated on the accompanying sketch map. This extension would enable motorists, cyclists, and others to avoid the crowded and tram-ridden Uxbridge and Harrow Roads in their most congested parts, and give a clear and quiet road through to Ealing Common free of tram lines.

A. L. G.

Perspective Drawing.
To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I read with much interest the review of Mr. Storey's book on perspective, in your issue of Feb. 1st, and now that the subject is under discussion I should like to allude to a side of the matter which seems to me to be of some importance: I mean the usual method of drawing a bird's-eye view—viz., by keeping the eye-line above the picture. Although the usual practice, it is surely not one to be commended.

In the first place, the picture is so foreshortened as to detract considerably from its value. The direction of the visual ray, too, is perfectly horizontal, but the effect conveyed is that of a downward direction. Apparently the excuse is that the picture plane is by that means kept perpendicular, and the vertical lines in the picture do not run to vanishing points.

As a matter of fact, it seems very little is generally known about perspectives beyond the usual elementary methods, with a perpendicular picture plane in front of the building, and preferably touching it at one corner: the usual position of the main height line! I have endeavoured to get wider information on perspective, but with scanty success, and I have come to the conclusion that one has to evolve a good deal for one's self. A certain architect who turns out some very effective perspectives, admitted to me that he always did them by eye, and that he doubted whether he could work out a perspective if he tried! I should be very glad if you would kindly treat the subject in your columns when space permits.

A SUGGESTED DEVELOPMENT SCHEME FOR SHEPHERD'S BUSH, LONDON, W.

The enormous advantage of being enabled readily to put into perspective any view, at whatever angle, and free from the limitation of a level axis, is at once apparent, and many instances will immediately occur to one. In roof views the chimneys would require a little care, but for interiors, such as looking down into a hall, or up into a gallery (a worm-eye view), it would be most useful. To get a view looking down a staircase by the ordinary method is of course absolutely impossible. Some interesting and novel perspectives could be obtained by this advanced method, and would certainly be a welcome addition to the stereotyped perspectives one invariably meets with.

Perhaps the most important benefit to be derived would be that it would help one to get into the way of imagining a building from any point of view, and should greatly assist design as regards proportion and effect, and also construction. We are apt to think too much on one level.

A REGULAR READER.

LONDON MASTER BUILDERS' ASSOCIATION ANNUAL DINNER.

The annual dinner of the above Association was held in the Whitehall Rooms of the Hotel Metropole, on Thursday, February 23rd. Among the company were Sir Lawrence Gomme, Mr. Frederick Higgs, Mr. Edwin T. Hall, Mr. F. G. Rice, Mr. William Shepherd, Mr. Robert Cobay, Mr. Arthur Keen, Mr. Ernest J. Brown, and many others.

The loyal toasts having been honoured, Mr. William Shepherd, proposing the toast, "The Professions," referred to the times when the architect and builder were combined in one person. A great deal of criticism, he continued, had been made with regard to the architecture of London streets, and it was debated whether an architect should impress his individuality upon a building, or should simply contribute to a general scheme. The architectural work in Kingsway and the neighbourhood was disappointing owing to the lack of harmony. All the buildings were of merit, but failed to make a whole. The speaker then referred to the diverse subjects with which the architect was supposed to be familiar, and concluded with a brief reference to the profession of surveying.

Mr. Arthur Keen, F.R.I.B.A., responding for the architects, said he had never ceased to admire the skill and judgment of the London builder in overcoming the innumerable difficulties presented by the average London site. He was happy to think that the best possible relations continued to exist between architects and builders. Mr. Keen concluded his speech with a description of the Architectural Association's methods of training the young architect.

Mr. S. Chatfield Clarke, F.S.I., replied for the surveyors, observing that the surveyor's lot, like the policeman's, was "not a happy one." They suffered severely from the practice of advertising for quantities by competition. In America, he was told, they had no time for the quantity surveyor.

Mr. Frederick Higgs then proposed the toast, "The L.C.C. and Municipal Authorities," observing that municipal institutions dated from Roman times; and, in a luminous survey, he proceeded to trace their history up to the formation of the L.C.C.

Sir Lawrence Gomme, in reply, said that the L.C.C. was at that moment utilising

the organisation of the L.M.B.A. for the purpose of guiding future legislation. It had been suggested that the improvement of the West End of London inflicted an injustice upon the East End, but he disagreed. The people of the East End took a pride in walking through the streets of London, and in admiring the big buildings erected.

Mr. F. E. Wallis, J.P., replied appropriately for the municipal authorities.

Mr. Edwin T. Hall, F.R.I.B.A., in proposing the toast "The London Master Builders' Association," referred in feeling terms to the death of Mr Howard Colls. The L.M.B.A., he continued, was founded upon two bed-rock principles—co-operation among themselves, and conciliation towards those they employed. And with the introduction of conciliation, all the old troubles and bitterness of feeling had passed away. Sir Lawrence Gomme would agree, he thought, that an Act, when introduced, could be considerably improved by the criticism of those who had to carry out its provisions. Referring to professional matters, it was outrageous, said Mr. Hall, that the architect should be held responsible for that insidious disease dry-rot, which was comparable to small-pox in a human being. The germ was produced in the forest and was brought in the timber.

Mr. Leonard Horner, responding to the toast, said the Association, in the course of the year, had done an enormous amount of work, and had dealt with a large number of questions affecting the trade. The Association, through its Organisation Committee, had added to its numbers both in ordinary and associate members. With regard to the new land value duties, representations had been made to the Chancellor of the Exchequer setting forth the injuries sustained by the building trade. It was felt that the Act was not intended to penalise this or any other trade; and no doubt if the objections raised were found to prevail, those clauses affected would be speedily removed from the Act. Having referred to the proposed Act of Parliament to provide against unemployment, which he thought would act disastrously upon the whole building industry, the President alluded to the part taken by the Association in the conference with the L.C.C. with respect to the proposed regulations to govern the construction of buildings in reinforced concrete. The apprenticeship question, sub-contracting, the introduction of reinforced concrete (which he recommended builders to master in every detail), were all touched upon in the President's comprehensive review.

Mr. Fred. L. Dove then proposed the toast, "Our Guests," to which Mr. Robert Cobay, Master of the Worshipful Carpenters' Company, replied.

NATIONAL CONFERENCE ON TOWN PLANNING.

The number of representatives appointed to attend the National Conference on Details of Practical Town Planning at Liverpool on Thursday and Friday last so far exceeded expectations that it was found necessary to secure greater accommodation than could be afforded by the School of Civic Design in Liverpool University, and accordingly the sittings were held in the concert room of St. George's Hall. The subjects under discussion were—(1) The actual details of the various steps which should be taken prior to the presentation of a formal application to the Local Government Board for permission to prepare a town-planning scheme; (2) the extent to which a local authority should, under a

town-planning scheme, relax or alter conditions relating to widths of roads and methods of road construction; and (3) the standards as to limitation of the number of houses per acre and the best practical methods of applying these standards in the preparation of town-planning schemes.

Alderman W. Thompson, chairman of the National Housing and Town Planning Council, presided at the conference, which was opened by the Lord Mayor of Liverpool, who was joined by Mr. W. H. Lever in welcoming the representatives. At the conversazione held on Thursday evening, Profs. Reilly and Adshead received the visitors. At the close of the conference, the National Advisory Town Planning Committee was elected for the coming year. On Saturday the representatives visited Southport at the invitation of the Mayor.

COMPETITIONS.

Higher Grade School, Girvan.

The assessor in this limited competition (Mr. H. E. Clifford, of Glasgow), in which nine sets of designs were submitted, has placed first those of Mr. Cowie, of Ayr. The total cost of the scheme is estimated at £6,000.

Church Hall, Kendal.

Architects practising in Kendal are invited to submit competitive designs, together with written descriptions and estimates, for the erection of a church hall. Premiums of £10 and £5 respectively for the designs placed first and second. Particulars from G. F. Braithwaite, Albion Chambers, Kendal.

Church, New Cumnock.

The Deacons' Court of New Cumnock propose to build a church and enlarge the existing hall at a total cost of £3,700, and are inviting architects to submit designs. They claim, however, that every design shall be "the exclusive property of the Court, with full power to use it, or deal otherwise with it, according to the Court's own absolute discretion." The Court, however, if they adopt any of the plans, may "give the author thereof a gratuity of £10 sterling," but "the Court shall be in no way bound to employ him as architect in the matter." "Gratuity" is distinctly good.

"Buffaloes" Orphanage, Aldridge, Staffs.

A meeting of the general committee of the above Institution was held at Nottingham on February 18th, to consider a report from the directors on the plans recently submitted in competition for the enlargement of the Orphanage. Three sets of plans had been selected for final consideration under the noms de plume of "Staffordshire Knot," "Staffs," and "Airy." The first-mentioned design was unanimously adopted, and was found to be the work of Messrs. Jeffries and Shipley, of Walsall. The additional accommodation provides for 55 cots.

STANDARDISATION OF LOADS ON HIGHWAY BRIDGES.

Mr. Henry C. Adams, Assoc. M. Inst. C.E., 60, Queen Victoria Street, E.C., Mr. A. Ernest Prescott, Borough Surveyor, Eastbourne, and Mr. H. C. H. Shenton, 28, Victoria Street, London, S.W., have been nominated by the Council of the Institution of Municipal Engineers to represent that body at the joint conference being called by the Concrete Institute to arrive at a working standard for the loads to be provided for in designing new highway bridges.

COST OF SCHOOL BUILDINGS.

The report of the Departmental Committee (formed on a year ago) on the Cost School Buildings was issued last Wednesday. The members of the Committee were Mr. L. A. Selby-Bigge, principal Assistant Secretary of the Elementary Education Branch of the Board of Education; Mr. N. T. Kershaw, Assistant Secretary to the Local Government Board; and Mr. F. Clay, Architect of the Board of Education. The terms of reference to the Committee were to inquire and report (a) whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present; and, if so, (b) what steps should be taken to facilitate the adoption of such materials or methods, and whether any alteration in the law is required for the purpose.

The Committee first considered what is the expectation of "useful life" for which an architect should allow, and how far it is possible to make the "structural" coincide with the "useful" life. The Committee think that where the population is of a shifting or exceptional character and it is uncertain whether any school or so large a school will be required after a limited period of, say, between 15 and 20 years, something between a permanent and a temporary building is wanted, and the ingenuity of school architects is directed towards finding a satisfactory type of semi-permanent building, cheap to erect, inexpensive to maintain, cool in summer, and warm and dry in winter. During the period immediately following the Education Act of 1870 the usual cost of school building was £5 to £6 per place, but now even economically built schools cost from £10 to £13 10s. per place. This increase is due, in many cases, to conditions not under the direct control of the local education authorities, but the Committee find that local authorities do not all or always practise those reasonable economies which are in their power, or exercise sufficient control or self-restraint in the matter of the style and general character of the buildings. The "ecclesiastical type of school" is happily disappearing, and, in the opinion of the Committee, it was a most unhappy invention from every point of view, and has proved lamentably expensive. Local patriotism, we are told, often confuses modesty and simplicity with meanness, and demands buildings of an expensive character. The Committee have received no evidence indicating that any authority is justified in spending £20 per place.

The possibility of savings in details is discussed at length, and the Committee recommend (1) That local education authorities should be encouraged to submit specific proposals for the use of novel materials or methods for public elementary schools. (2) That it should ordinarily be made a condition of the approval of such proposals that such provision as is practicable should be made for the periodical inspection of the structure. (3) That, for the purpose of facilitating the use of novel methods and materials (a) legislation should be promoted to exempt school buildings the plans of which have been passed by the Board of Education from and operation of local building by-laws and corresponding provisions in local Acts; (b) the Building Regulations of the Board of Education should be revised so as to remove any difficulties placed by

them in the way of the adoption of such methods or materials. (4) That, where proposals are approved for the use of novel methods or materials, such as those described in detail in the body of the report, in the erection of permanent schools, a loan period of 30 years should, until further experience is available as to the durability of such structures and their immunity from repairs, be regarded as normally appropriate to such cases.

We dealt last week with the obvious danger of exaggerating the demand for cheapness, and shall recur to the subject.

IN PARLIAMENT.

(By our Gallery Representative.)

Town Planning Schemes.

In the House of Commons, Mr. Clough asked the President of the Local Government Board whether he would give a list of all the town-planning schemes which had been submitted for his approval since the Act of 1909 came into force, and whether he would state which of them had received his approval and which were at present being carried into effect.

Mr. John Burns supplied the following printed reply—Under Section 54 (2) of The Housing, Town Planning, etc., Act, 1909, it is necessary for a local authority, before preparing a town-planning scheme, to obtain the authority of the Local Government Board for the preparation of the scheme. Application for such authority has been made in three cases, namely:—(1) By the Corporation of Birmingham in regard to an area comprising the parish of Quinton and parts of the parishes of Harbourne, Edgbaston, and Northfield (2,320 acres). (2) By the Corporation of Birmingham in regard to an area comprising part of the parish of Aston (1,477 acres). (3) By the urban district council of Ruislip-Northwood (about 6,000 acres). I have given the necessary authority in respect of the case first mentioned, and the Corporation are now in a position to proceed with the preparation of a scheme to be submitted to the Board for approval. As regards the other two cases, I have caused local inquiries to be held into the applications, and my decision thereon will be given at an early date. I may add, for the information of my honourable friend, that although the three cases above-mentioned are the only cases which have reached the stage of formal application to the Board for approval of the preparation of town-planning schemes, I have information that the question of preparing such schemes is being considered by a number of local authorities, urban and rural, and numerous conferences have taken place with the Board's officers on the subject. I have reason to suppose that in several cases the authorities are taking definite action with a view to the preparation of schemes in the near future."

Carnarvon Slates.

Mr. Hobhouse, Financial Secretary to the Treasury, in reply to Mr. Ellis Davies, who asked whether Carnarvon slate was included among slates that might be used on public works in Ireland, said that it was the practice of the Board of Public Works, Ireland, to indicate the standard of slate they required by mentioning some slate known in the trade as reaching that standard. It was then open to the contractor to propose to use a slate from another quarry, and, provided the Board were satisfied as to the qualities of the slate

proposed to be used, they placed no restrictions on their contractors as to the place from which the supply was obtained.

New Roads in Ireland.

Mr. Hobhouse has supplied to Mr. Hayden the following information regarding the making of main trunk roads in Ireland:—The Road Board have sent to each county council in Ireland a map indicating the roads, both on the coast and inland, towards the improvement of which they consider their first contributions should be made. In selecting from these roads the portions which should be dealt with in the first instance the Board will consider any applications and representations which have been made or may be made to them by the county councils responsible for the improvement and maintenance of the roads in question.

Mr. Hayden wished to know what were the data before the Road Board before they issued their circular of the 9th February addressed to the Irish County Councils that decided them to offer a grant for a motor road for tourists all round the coast of Ireland.

Mr. Hobhouse replied that before the Road Board issued their circular of the 9th February, addressed to Irish county councils, they had before them applications from nearly all the county councils in Ireland. They had also had representations from the Irish County Councils' General Council and the Irish County Surveyors' Association. It was not the intention of the Road Board to administer the Road Improvement Fund in the interests of any one section of the community.

Bolton Post Office.

Mr. Gill asked if Mr. Dudley Ward, representing the First Commissioner of Works, was aware that it was now three years since the erection of the new Post Office for Bolton was promised, and that the present premises were utterly inadequate and whether he would ask Parliament to sanction estimates to proceed with the erection of the new buildings without any further delay.

Mr. Dudley Ward, in reply, said the building programme for post offices was settled in consultation with the Treasury and the Postmaster-General. The scope of this annual programme was limited by the sum which the Chancellor of the Exchequer was prepared to allow for the service, and it had been decided that the case of Bolton, with others, must give way during the next financial year to the even more pressing needs of other places.

Referees under the Finance Act.

Mr. Hobhouse informed Mr. Tyson Wilson that 13 referees under Clause 33 of the Finance Act had already been appointed. Two more were about to be appointed. Of the 13 already appointed, one was a Fellow of the Auctioneers' Institute, and all of them were Fellows of the Surveyors' Institution.

Sea Defence Works at Silloth.

The Council's consulting engineers, Messrs. Henry Adams and Son, of 60, Queen Victoria Street, London, E.C., have reported that the sea wall and concrete apron at Silloth, about 1,400 yards long, carried out under the first contract, has now been satisfactorily completed, and application has been made to the Local Government Board to sanction a loan in connection with the proposed extension for about 1,000 yards, which is to be carried out as soon as possible.

ENQUIRIES ANSWERED.

Cost of Theatres.

T. S. (NORTH) writes:—"Please furnish particulars of the cost of theatres (price per cube and price per seat) of 1st and 2nd class in London and the provinces."

—It is very difficult to give the desired information, as theatre work being a special class of building, the price per foot cube varies considerably, according to mode of construction, decoration, finish, requirements of authorities, etc., but a fair price would be about 1s. 6d. for 1st class and 1s. 3d. for 2nd class.

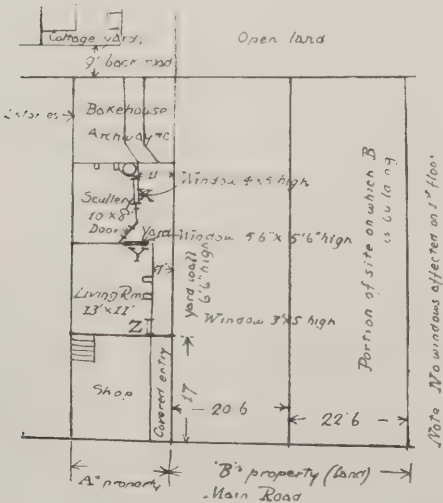

Petrol Gas Lighting System.

S.W. (LEICESTER) writes: "Is a system of petrol gas lighting safe and satisfactory with the tank at the highest point supplying petrol to burners by gravitation, the gas being generated at the burners? Economy of installation and of maintenance is essential."

—Enquirer should consult his fire insurance company and see if they will accept the system as an ordinary risk; the luminosity is satisfactory, but petrol inside a house is not desirable.

Right of Light Question.

J. H. W. (BURSLEM) writes: "B buys a plot of land and wishes to erect shop premises thereon close to A's property, built some 25 or 30 years (with the exception of bakehouse, etc.). A's gable is only 17 ft. deep; B would undoubtedly diminish the light to A's windows, but had A not built the bakehouse some 10 years ago he would still have had ample light notwithstanding B's building close to his property. The crux of the question is: Supposing A had not built the bakehouse, and shut himself in, as it were (when the adjoining land was built on) and would have had sufficient light from his chief windows when the proposed B's property was erected, can A now claim from B if he built close up and took away light, now valuable, but not so if the bakehouse had not been built? It appears to me somewhat oppressive that B should suffer because A had blocked his site up at the rear with a two-storey building in recent years. Window Z is a subsidiary light, and the main one for lighting (Y) must have been more than ample for lighting purposes. Again, the lateral light to window X, together with the little interference which might have been caused by B's back buildings, would have been ample if the bakehouse had not been put up."

—The enquirer does not state whether A's property is situated in a district where by-laws are in force; if so, A has without doubt built his bakehouse improperly, and has not left a sufficiency of air-space, "within the same curtilage," to comply with those by-laws. However this may be, I fear that the past laxity of the local sanitary authority does not at all affect the question of light and air as between A and B, and I am of opinion that B must accept the existing circumstances, and respect all the lights in A's property which are 20 years of age. The theory set forth in the enquiry is both interesting and ingenious, but I am afraid it would avail but little in a Court of Law.

If it should have happened that both properties originally formed part of a large estate, and were purchased subject to "Building Regulations," it is just possible that the "Conditions of Sale" of the original property may assist B, but from a public point of view it certainly appears to be undesirable that the land should be so closely built up as appears customary in this neighbourhood. F.S.I.

System of Filing.

In reply to the enquiry which appeared under the above heading in our last week's issue, a correspondent (J.E.B. Sherborne) writes as follows: "I had the same need as your correspondents W.J. and W., and had a case made which I have found most useful for keeping unrolled drawings and maps unrolled. The case is a box of 1 in. pine, with 1/2-in. back, of a convenient length and depth to back to take the largest size drawings, and of the height to take, say, 8 or more trays. The ends of the case are grooved, barely 3/8-in. deep, and of the width to take framed slides of 1-in. pine, out of 2-in. x 1-in., with a middle cross-piece. This is covered with mill-board. These are light and easily drawn forward to take out any drawing required. I have a 2-in. open space between slide and slide, which gives room for a good number of sheets. The slides can be numbered or lettered to correspond with a number or letter on the drawings. The whole is enclosed in front with an American cloth curtain tacked on the top, and with a light roller on the bottom to keep out dust. This is readily folded back on top of the cases when sheets are wanted."

Flow of Oil in Pipes.

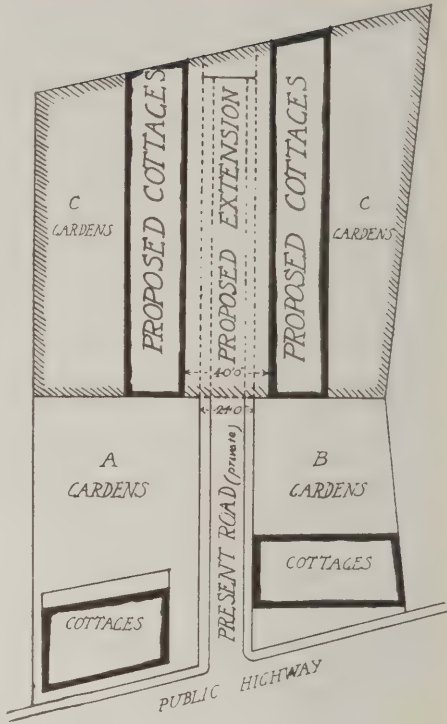

W. G. W. (DOVER) writes:—"Please state a formula for determining the flow of oil in pipes, and also one to ascertain the pressure in lbs. per square inch on the pipes."

—I do not know of any formulæ specially applicable to the flow of oil. In the absence of any precise information, it would probably be sufficient to calculate as for water, but allowing 25 per cent. additional head to overcome viscosity. Box's "Practical Hydraulics" (Spon; 5s. net) will give all formulæ for friction, losses at bends, branches, etc.

HENRY ADAMS.

New Road and a By-law.

"BUILDERS," (LANCASHIRE) write:—"We shall be glad of your opinion in the following case: C is the owner of the land shown hatched on the enclosed plan; the front portion being owned by A and B. C is desirous of erecting workmen's dwellings on his land, and proposes to extend the present road, placing gates across on his boundary line, and building on each side. The Council's surveyor contends that this extension constitutes a new street, which,

being over 100 ft. in length, must be constructed as a carriage way in accordance with their by-laws, which require a width of 36 ft., notwithstanding the fact that the present road, of which it forms a part, is only 24 ft., and cannot be widened."

—The Council's surveyor is quite right, and unless C can make another entrance to his proposed new street of the full width of 36 ft. he cannot comply with the by-laws either with regard to his new street or with regard to the cottages he proposes to build. Were the present 24 ft. road a public highway repaired by the local sanitary authority, and not merely a private right of way, the position would be quite different, and C might then lay out his new street as he suggests. F.S.I.

Registration of Architects.

"ASSISTANT" (NEWCASTLE-ON-TYNE) writes:—"In the event of registration becoming established within, say, a year or two, what would be the position of an assistant (age about 26, with ten or eleven years' experience) with regard thereto? Would the fact of his being an Associate of one of the R.I.B.A. allied societies have any bearing on the question?"

—The Bill drafted and promoted by the Society of Architects provides that any person who at the date of the passing of the Act is a member of the Royal Institute of British Architects, the Society of Architects, or a professional member of certain other architectural societies scheduled in the Bill, shall in respect of such membership be entitled to be registered under the Act on payment of the registration fee, and that any person who can prove to the satisfaction of the Council that he was practising architecture in the United Kingdom prior to the first day of January, 1909, and is still so practising, or has served as apprentice, assistant, or practitioner for seven years in the aggregate after having attained the age of fifteen years, prior to the passing of the Act, shall, on payment of the registration fee, be entitled to register on making the required declaration.

It will be seen from this that, so far as the Society of Architects' Bill is concerned, "Assistant" and those in a similar position would be protected. B.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Evils of Competition.

The reinforced concrete industry cannot expect exemption from all the evils of competition, although it may very reasonably remonstrate against the intrusion of conditions that, while they are too often and too easily tolerated in other directions, must be, as a mere matter of common-sense precaution, sternly discountenanced by the designer in reinforced concrete. Mr. R. W. Vawdrey, in a paper read recently before the Concrete Institute, drew attention to some of these evils. In the first place, the concrete specialist, like a good many other victims of the tendering system, is expected to do a great deal of work for nothing. He, like the general contractor, is often set to work on the elaboration of estimates which he knows have but one chance in twenty, perhaps, of being accepted; and it is not particularly consoling to him to know that nearly a score of other experts are simultaneously figuring fruitlessly on the same job. It is a shocking waste of effort, and the federated master builders are considering how best they may oppose the wasteful system of tendering without quantities. Of course the reinforced concrete specialist is in a somewhat different position. He must perforce do a great deal of independent calculation; and, under present conditions, he is expected to do it without fee or reward in case his tender is unsuccessful. This is manifestly unfair, whether we regard the result as a dead loss to the specialist, or as a sort of "carry-over" to the next successful tender. In either case it is an unfair transference of obligation to bear an expense that is uneconomically created and is therefore irksome and abhorrent, but is apparently, at the present stage of progress, unavoidable.

Waste of Effort.

What, however, can and should be resisted is the increasing tendency on the part of clients to assume that the specialist must himself obtain at his own expense all the data as to site, foundations, etc., which obviously ought to be supplied to him by the architect or engineer in charge of the work. This would not matter very much if the specialist were sure of getting the work; but when he is tendering competitively, and when perhaps a score of other specialists are required to go to the same trouble, the iniquity is multiplied to nauseation, and, following the example of the federated general builders, the concrete specialists should cast about for some effectual method of dealing with the evil.

Competitive Designs.

Another evil which is creeping in is that of inviting competitive designs for reinforced concrete structures. As the matter of competitive quantities follows the false analogy of the general building trade, so that of inviting competitive designs is a kind of perversion of custom with respect to architects, who, as a rule, as Mr. Vawdrey observes, are only expected to compete for large and important public buildings; whereas the designer in reinforced concrete is evidently faced with a rather irritating and undesirable extension of this

practice, which, in the case of a private owner, obviously offers none of the compensating advantages of recognised architectural competitions. Mr. Vawdrey suggests that only one firm should be asked to prepare, as a basis for tendering, preliminary designs and an estimate of cost, on the understanding that, these preliminaries being approved, the same firm should be employed to prepare, for a definite stated fee, complete working drawings, from which the work may be executed by the successful tenderer in the ensuing competition. It is further suggested that, where competitive designs are invited, the more meritorious of the unsuccessful designs should be premiated, as is the custom in architectural competitions.

Specialists in Design.

The proposal to have preliminary designs and working drawings prepared on commission is at first sight admirable. But, when it is more closely examined, rather serious objections to it may be confidently anticipated. Would the selected firm be allowed to compete for the work? If not, would it be worth the while of specialists to undertake to get out designs, estimates, and working drawings? In course of time, when the details and formulæ of reinforced concrete construction became completely standardised, it might be possible to specialise in the preparation of such schemes as those suggested; but, failing the creation of a special class of designers and estimators, who would not expect to execute the work, it might be difficult to persuade the ordinary contracting specialists that the mere preparation of designs and estimates is sufficiently remunerative; also difficulties might arise from the natural preference of the firm executing the work to prepare their own working drawings. If, again, the firm commissioned to get out the designs and estimates were allowed to compete for the work, they would apparently enjoy an immense advantage in knowing very much more about the job than could be known by the other competitors.

Reckless Tendering.

This very knowledge, however, might in some instances cause them to make their tender higher than that of a firm having less familiarity with the details than that which arises from the minute knowledge acquired in preparing them. In that case, the winning tender might be lower than would be consistent either with fair profits or with that high standard of construction which we all desire to maintain, and from which, indeed, it is in the highest degree imprudent to depart. It should not be possible to say, as Mr. Vawdrey does, "that the condition of the industry at the present time was very far from being such that the best work in design was the most successful, or the most remunerative"; but it is to be feared that, for the reasons we have given, the suggestion for improvement would only result in aggravating the mischief. Nevertheless, Mr. Vawdrey did well to call attention to the growth of the evil, and to protest as vigorously as he did against any tendency "to put a premium on slovenly or reckless

work as compared with conscientious, careful, and well-thought-out designing." It is a tendency that must be firmly resisted and checked in every instance, in the interests not only of the profession, but of the client and of the system of construction. In any form of construction, mere cheapness is always bought too dear; in reinforced concrete construction it becomes, so to speak, reckless prodigality. This, however, is a point on which urgent insistency might only too easily be misconstrued. Yet there can be no question that we must be absolutely frank about it; although a certain amount of tact may be required in coupling the assurance that, given reasonable conditions, reinforced concrete construction is absolutely safe, with the somewhat disquieting reminder to a timorous and parsimonious public that the system is one to which the application of niggardly methods is fraught with particular peril.

Discoloration in surface of concrete work

Concrete Work. generally disappears upon weathering.

It has no deleterious influence, and if required to be removed it can be rubbed off with a wire brush and water, or painted with a liquid mixture of cement and water. It is, nevertheless, exceedingly annoying, as it temporarily renders the building unsightly, and often gives rise to groundless alarm on the part of the client, and thus is apt to create an unfair initial prejudice which is apt to last longer than the cause thereof. The following observations may be useful as tending to prevent or allay such misgivings. An efflorescence in concrete work is sometimes due to the soluble portions of the cement coming to the surface during the drying of the concrete, and a good proportion of soluble constituents is generally looked upon as an indication of good hardening qualities in both cements and aggregates. The leaching out of certain lime compounds in both cements and aggregates and their disposition on the surfaces of concrete works are frequently the cause of the varying colour of such surfaces. This discolouration is generally found to be primarily due to variations in the amount of water in the mortar of which the cement is composed. It will be readily understood that where any excess of water is used, segregation of the coarse and fine particles will take place with a resulting difference in colour. The amount of water in a concrete, the face of which is to be exposed, should be neither too small nor too large, but such a concrete should certainly not be dry, or the exposed face will be honey-combed. Where the greatest care is used as to the amount of water added to the mortar, and to prevent its loss, and where the separation of the mortar from the broken stone is carefully avoided in depositing the concrete and in ramming it, the exposed surface after the removal of the moulds is fairly uniform in colour. A more uniform colour will always be obtained where some puzzolanic material is ground with the cement, such as slag or trass. Exactitude in the amount of water used in the concrete, and the addition of some substance containing silica in an active form, are the two steps to be taken to produce a concrete surface of uniform colour.

A REINFORCED CONCRETE TANK. BY FREDK. RINGS.

REINFORCED CONCRETE CISTERNS
AND TANKS.

One of the most remarkable characteristics of reinforced concrete is its wide range of service—its ready adaptability to very varied requirements. Cisterns and tanks of every description are peculiarly adapted to construction in reinforced concrete; and whenever sand and gravel are found on or near the site, the work can be carried out cheaply and rapidly. For the purpose of waterproofing, it is customary to plaster the internal surfaces with a rich cement mortar mixed 1 to 1, or a thin layer of asphalt may be sandwiched in the concrete. A coating of tar, or some similar substance, is often used, but this requires renewing from time to time. If the tank is sunk, an asphalt coating is used externally to separate the structure from the ground. The bottom slab is frequently made of ordinary concrete, reinforcement being introduced where the foundations are bad or at all doubtful. Tanks for the storage of acids are coated with a mixture of glycerine and red lead, or any of the many patent compositions on the market. Another good finish for such a tank is a lining of closely fitted glass slabs. With respect to shape, circular tanks are more reliable than square ones; the latter are liable to become defective at the corners, and heavy reinforcements, to prevent bending or the bulging out of side walling, become necessary. The accompanying drawings show a design for a tank of this latter type. The additional amount of materials required necessarily adds to the cost. As the stresses increase toward the bottom of the tank, it becomes imperative to build in extra reinforcements for the lower portions of the sides, or, by equal distances, to increase the sectional area of the rods. Vertical rods are principally employed in order to keep the main rods in proper positions during concreting. The walling is made, as a rule, 4 inches thick at the top, increasing to 5 or 6 inches at the bottom. In the case of large areas, expansion joints must be provided. Particular attention, as in all reinforced concrete work, must be given to workmanship, and special care taken that the concrete has a uniform density, and that the various batches, as used, have a uniform quantity of water, so as to ensure setting and even drying-out.

LONG-SPAN CONCRETE ROOF
ARCHES.

The Garnisonskirche, at Ulm, Germany, is a large church in which the structural members are built of concrete, the most striking feature being the roof arches, which enabled the body of the church, 73.8 ft. wide and 111.5 ft. long in the clear, to be built without the use of obstructing columns. The structure is carried on concrete piles about 30 ft. long placed in groups under the skewback piers and under the main foundations at the ends. The arches might be described as curved beams, the curve above the apparent springing line being quite flat. They were, however, designed as arches with a span of 89.5 ft. between centres of skewbacks. The arch ribs are 24.6 ft. apart on centres, rise 59 ft. from skewbacks to the centre point at the crown, are 1 ft. $7\frac{1}{2}$ in. wide, $6\frac{1}{4}$ ft. deep at the crown and $14\frac{3}{4}$ ft. deep at the skewback. The ribs are pierced by openings for the side aisles just above the skewbacks. Between the ribs are concrete beams for carrying the masonry curtain walls. The ceiling is a concrete beam and slab system supported by the arches; and since both arches and beams are exposed, the arches were built to curves designed for pleasing effect, and the bottoms of arches and beams were treated with embedded tiles.

The horizontal thrust is taken by means of ties composed of pairs of steel channels anchored in the skewbacks by means of angles riveted to them. The roof is carried by steel trusses, investigation showing that such construction would be more satisfactory than the designs in reinforced concrete. In order to carry these trusses flat beds were moulded on the haunches of the arches, and since these beds were practically over the skewbacks the arch loading comes almost entirely from the weight of the arches themselves and the ceiling. One end of the steel trusses is fixed and the other carried on rollers. The arches were figured for dead load alone, and dead load plus wind load on each side separately. The maximum stress allowed in the concrete was 568 lb. per square inch, both in arches and in beams and girders, and 14,220 lb. per square inch in the steel. The building was detailed and built by the Dyckerhoff and Widmann Company, of Karlsruhe.

REINFORCED CONCRETE SLABS.

A separate-unit type of reinforced concrete wall construction has been used in building the power house of a small hydro-electric plant at Newton Falls, Ohio. The pilasters are of monolithic concrete, while the walls between them are hollow and are built of inside and outside thin concrete slabs, which were set before the pilasters were poured, so as to be keyed into them. The slabs were reinforced with No. 28 gauge expanded metal, and were made in sizes that could be handled conveniently. Their outer surfaces were corrugated by laying $\frac{5}{8}$ -in. round rods in parallel lines on the surface of the fresh concrete when the slabs were cast, and pulling them out after the mixture had taken its initial set. These corrugations were designed to give a good bonding surface for the plaster coat which was applied to the walls after they had been erected. The slabs were allowed to cure, and were then placed on edge in proper position. Vertical form boards were placed for the pilasters, extending beyond the surface for the monolithic work, so that the slabs rested against them. The inside faces of the pilasters were moulded against form-boards placed in the air space between the wall slabs, and were wired to the outside forms after the pilaster reinforcement had been placed. The inside boards also acted as spacers to keep the slabs the proper distance apart. This distance varied somewhat, but 8 in. was the minimum. It is possible that this and similar systems may suggest themselves as being applicable to the new ideas on school construction.

Reinforced Concrete in Hydraulic Works.

The Permanent International Association of Navigation Congresses, which will hold its twelfth meeting at Philadelphia, in the spring of 1912, has appointed Mr. R. W. Vawdrey, B.A., A.M.Inst.C.E., to prepare a report upon the work which has recently been carried out in the United Kingdom in reinforced concrete as applied to hydraulic works. Communications on this subject from engineers who have used this form of construction in this direction should be sent to Mr. Vawdrey, Queen Anne's Chambers, Westminster, who will be glad to incorporate these particulars in his report.

COMPETITIVE DESIGNS AND TENDERS.

BY R. W. VAWDREY, B.A., A.M.Inst.C.E., M.C.I.

The following is an abstract of a paper under the above title which was read by Mr. R. W. Vawdrey at the fourteenth ordinary general meeting of the Concrete Institute, held on February 2nd, 1911, at 8 p.m., at Denison House, 296, Vauxhall Bridge Road, Westminster, Mr. Alexander Ross, M.Inst.C.E. (vice-president) in the chair.

It was, said the author, continually being forced upon the notice of all those engaged in designing in reinforced concrete that the conditions of the industry at the present time were very far from being such that the best work in design was the most successful or the most remunerative; in fact, he went so far as to say that a very considerable premium was placed on slovenly or reckless work as compared with conscientious, careful,

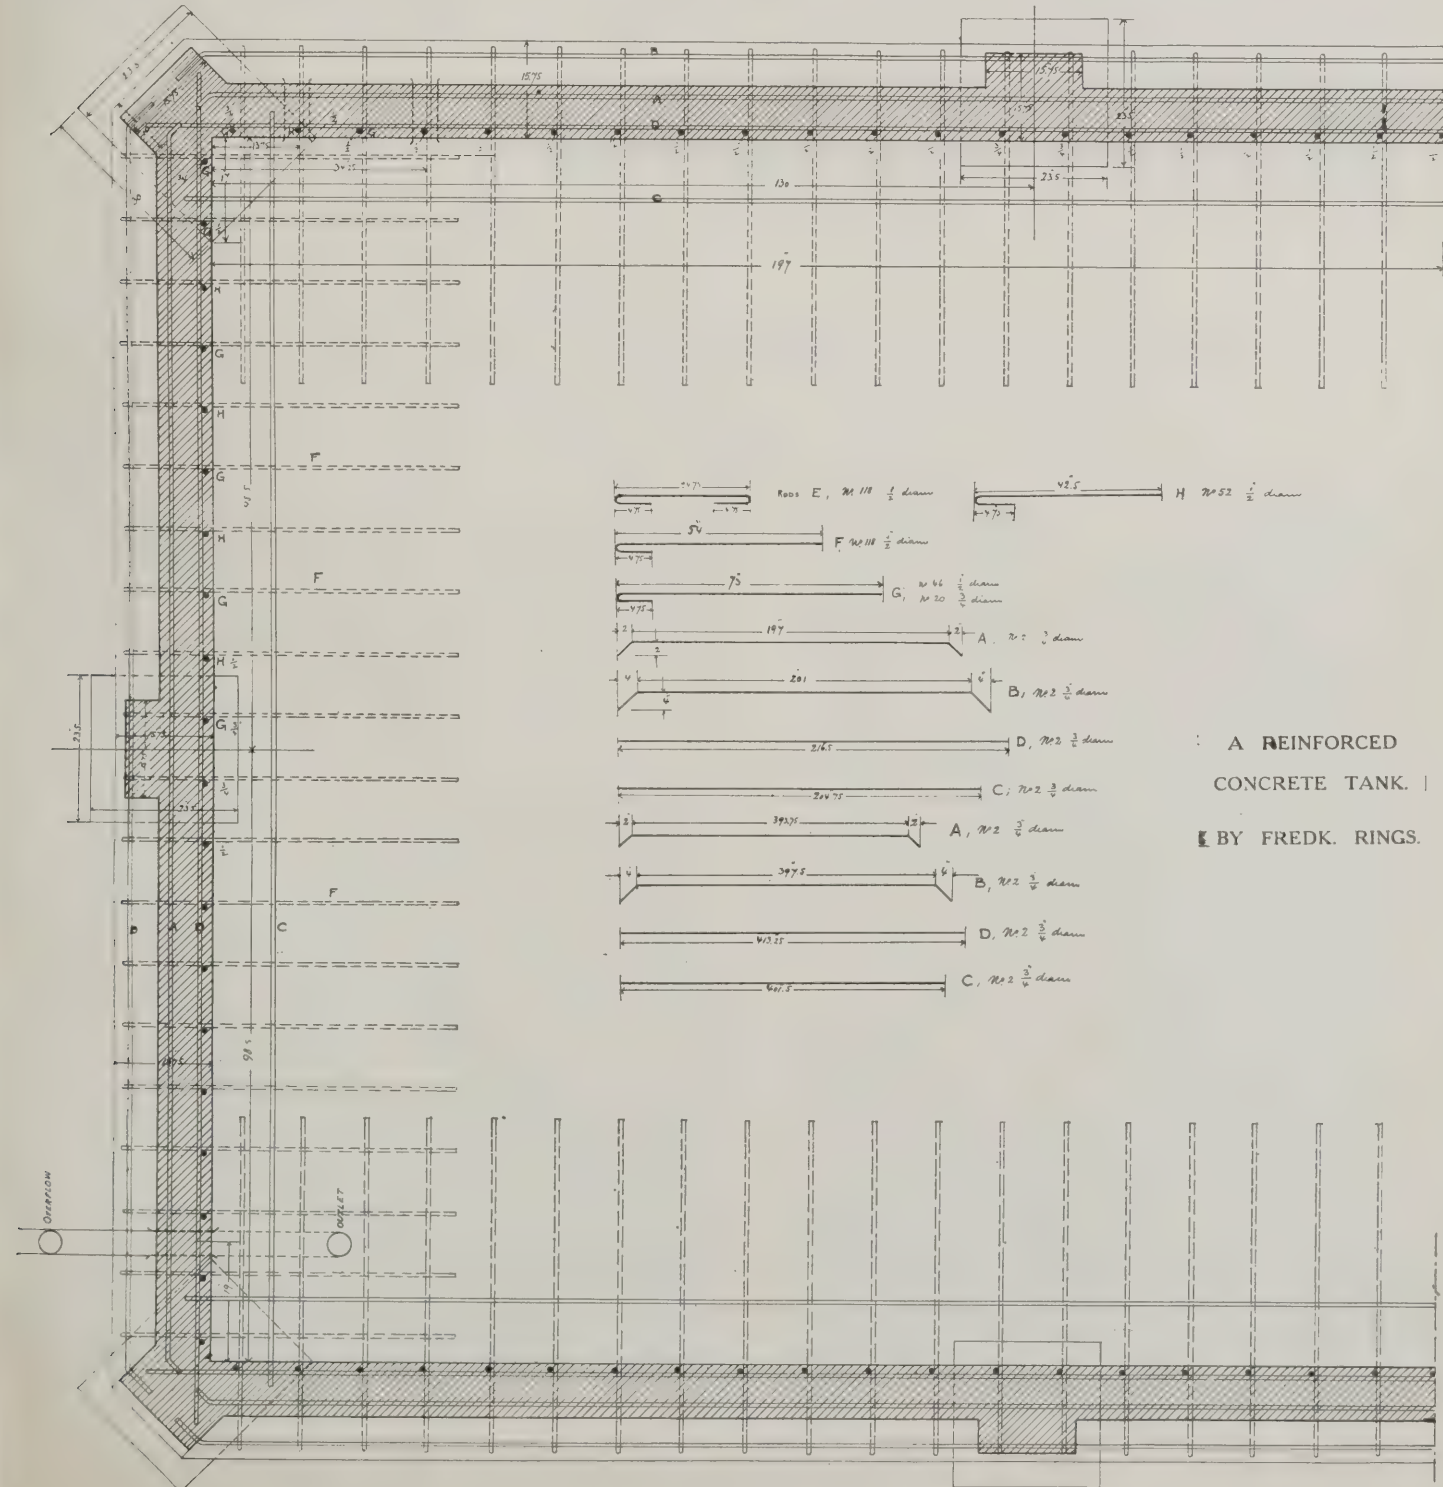

and well-thought-out designing. He proposed, therefore, to deal with the subject in the following order:—(1) the description of the existing conditions; (2) the causes which have led up to them; (3) what he believed to be the remedy.

He commenced by giving a few typical examples of what he considered unsatisfactory competition. From these it was seen that the specialist had usually to undertake the following work free of charge, and, moreover, to do it at the same time that a large number of his competitors were doing exactly the same thing. (1) To prepare preliminary designs for the structure in accordance with the general conditions required by the engineer or architect in charge of the work. This often necessitated the specialist's obtaining information as to the site, nature of foundations, etc., at his own expense. (2) To prepare lists of quantities upon which contractors can tender, and to be financially responsible for the accuracy of these quantities, i.e., be pre-

pared to pay the value of any omissions which may occur. He had also to accept financial responsibility for the stability of the structure.

To the first of these items in itself there was, of course, no objection, as it is the work for which a specialist exists, though all the necessary information as to the site, etc., ought clearly to be supplied by the engineer or architect. The grievance lay in the fact that the specialist should be asked to do it for nothing, and at the same time that a large number of his competitors were doing the same thing. Given certain conditions, any number of equally competent and experienced designers would generally arrive at more or less the same result. The design, therefore, frequently gained very little by such competition, while the designers lost a great deal.

The second requirement, however—i.e., the preparation and guaranteeing of quantities at a preliminary stage of the work—was most objectionable, and was

No doubt there might be many ways of obtaining the desired results, but the procedure which the author advocated was as follows:—When it was decided that a particular structure should be carried out in reinforced concrete, in all ordinary cases one reliable specialist firm, and one only, should be asked to prepare preliminary designs and an estimate of cost, on the understanding that if that appeared satisfactory that firm should be employed to prepare complete working drawings for a definite fee, previously arranged, just

Discussion ensued, in which the following took part:—Mr. C. F. Marsh, M.Inst.C.E., Mr. G. C. Workman, Mr. C. H. Colson, M.Inst.C.E., Mr. G. Corderoy, F.S.I., Mr. W. A. Haskins, Mr. L. Serrailier, Mr. T. B. Shore, Mr. E. F. Etchells, Mr. E. P. Wells, J.P., and Mr. Alexander Ross, M.Inst.C.E.

REINFORCED CONCRETE
BATH POND FOR JARROW
CORPORATION.

The adoption and satisfactory completion of the reinforced concrete swimming pond at Jarrow adds yet another example of this type of construction to the already long list of such structures. The work under notice was carried out for the Borough Council of Jarrow from the designs of Mr. J. H. Morton, F.R.I.B.A., of Newcastle-on-Tyne and South Shields, on a loan sanctioned by the Local Government Board. The pond, which is of the open subway type is 75 ft. long by 28 ft. 6 in. wide, and varies in depth from 4 ft. 9 in. at the shallow end to 8 ft. 3 in. at about 10 ft. from the deep end, and the subway extends all round the pond. The construction is substantially similar to the pond in the public baths at South Shields, which was built to the designs of the same architect.

As will be seen from the detailed drawing, the floor around the bath is constructed in the form of a gallery; it is generally 4 in. in thickness, reinforced with No. 8 3-in diamond mesh expanded steel, and is carried on beams reinforced with expanded steel bars—the beams being continued down behind the pond walls to act as buttresses.

The pond walls are 8 in. in thickness, reinforced with No. 6 3-in. diamond mesh expanded steel. Owing to the soft nature of the ground, the bottom was made 12 in. thick, reinforced with expanded steel.

The inside of the pond is lined with bitumen sheeting, and interlocking glazed bricks.

The details of the reinforced concrete construction were prepared by the Expanded Metal Co., Ltd., of West-

minster, who also carried out the work through the general contractors for the buildings, Messrs. Stephen Sherriff and Sons, of South Shields.

It is interesting to note that the Expanded Metal Company, Limited, have

carried out a considerable number of swimming ponds on their system; for example, two ponds at Chelsea, two at Hammersmith, one at Shotley Point for H.M. Admiralty, three at Salford, and one at South Shields.

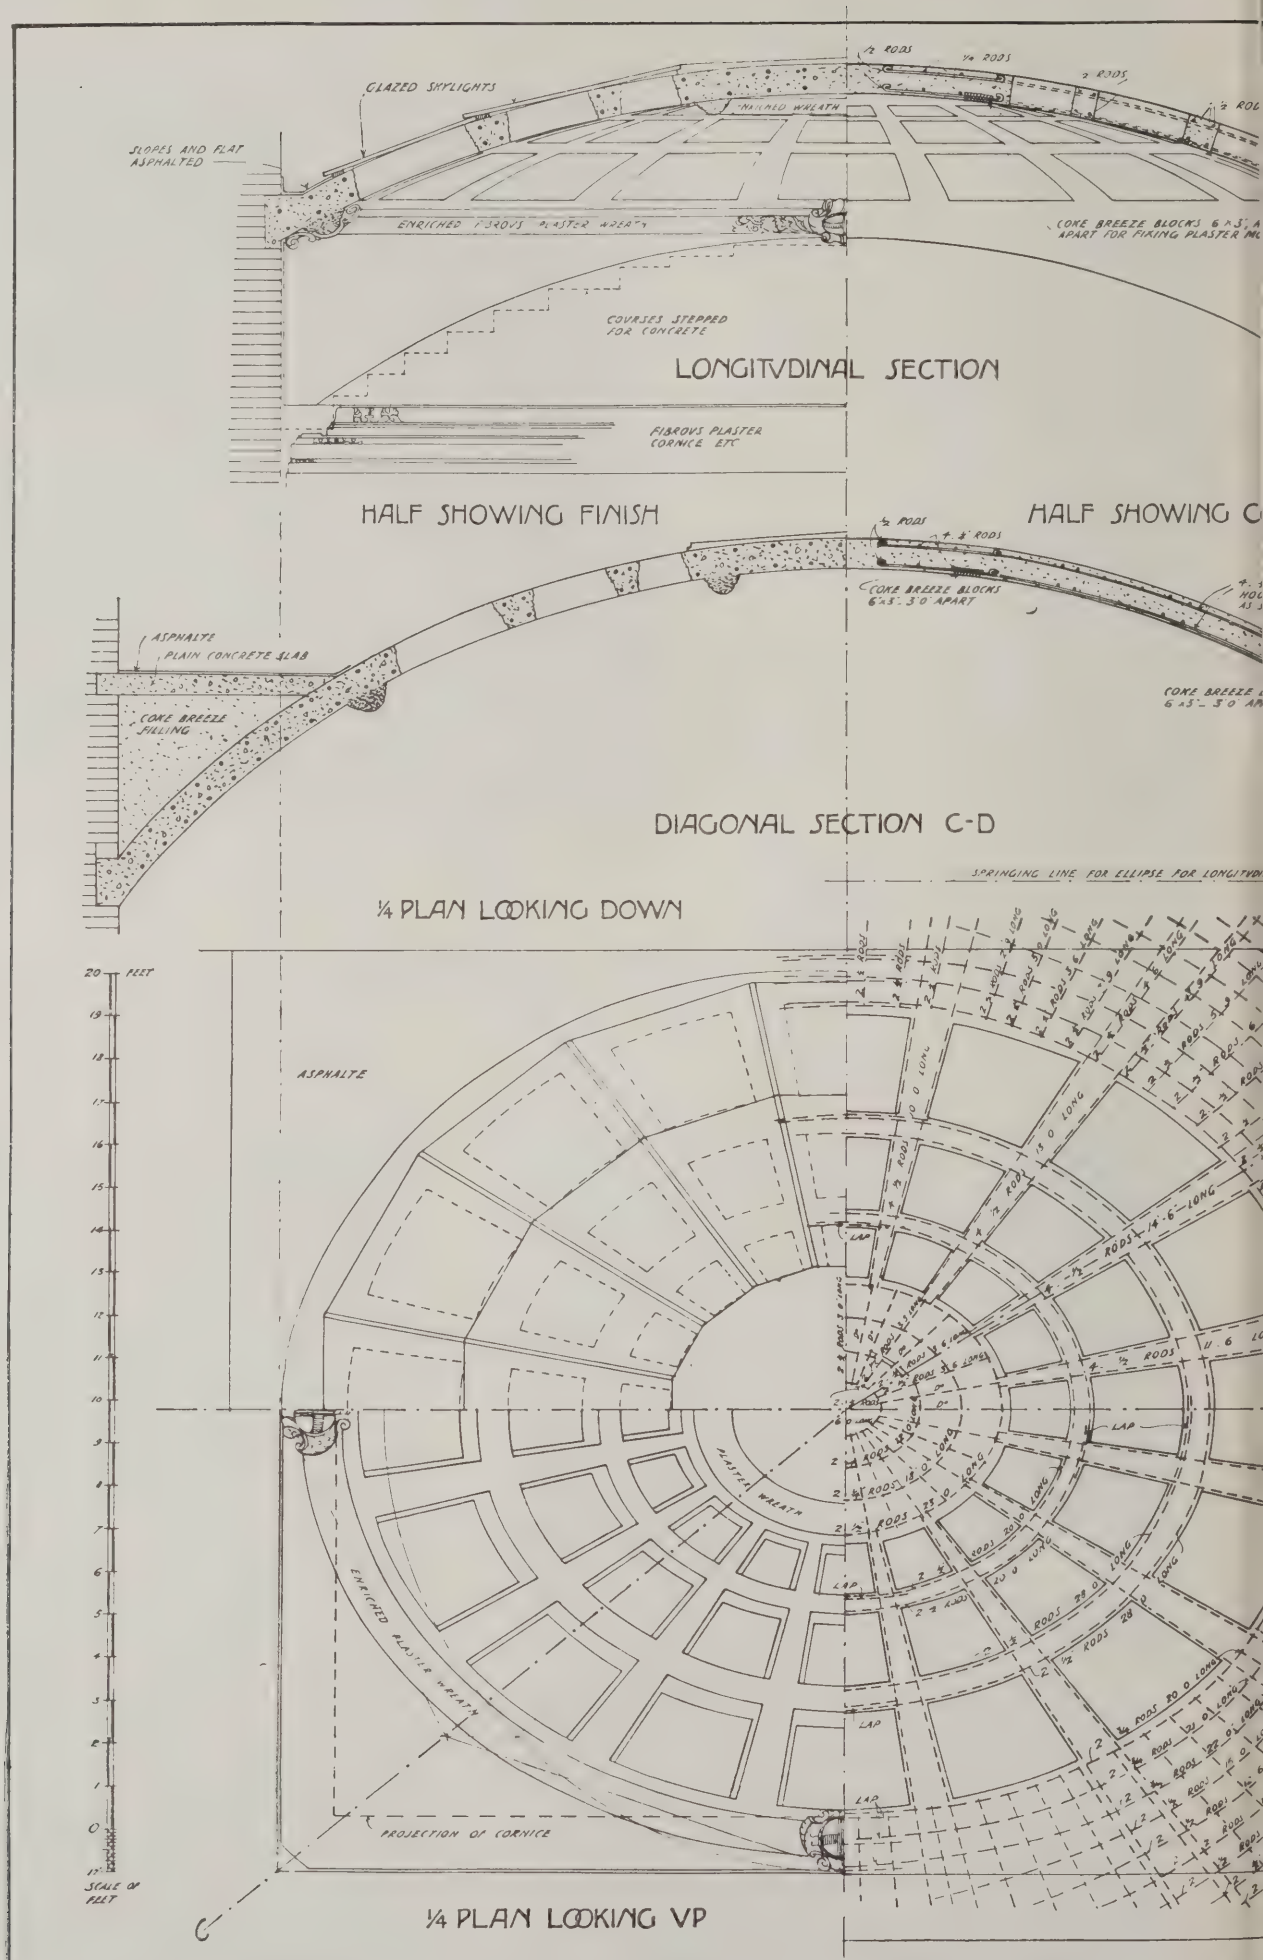

PUBLIC BATHS, JARROW: VIEW SHOWING CONSTRUCTION OF SWIMMING POND WITH EXPANDED METAL.

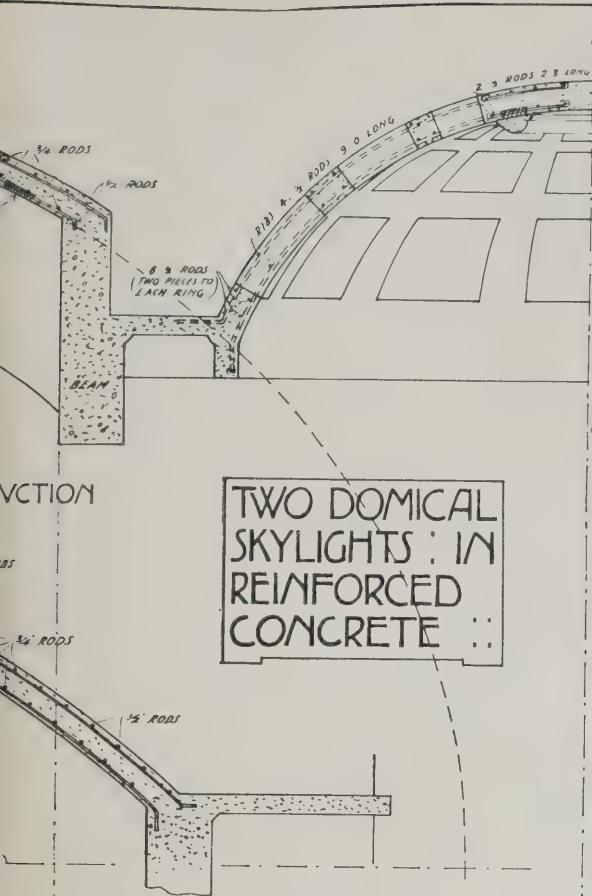

View of swimming pond in course of construction (showing glazed bricks laid over bitumen).

The swimming pond completed.

These dome lights are over the banking-hall of the Union of London and Smith's Bank at Hull. As will be apparent from the drawings, a form hoops over which transverse rods are hooked where shown. Externally polygonal skylights cover the coffering, and it is worthy of note that the drawing represents a domed interior at such short range without unpleasant distortion in the foreground, and photography also intensifies the contrast as an indication of the actual work. The domes were cons

ffered dome of ribs without panels is first formed of concrete reinforced with plain rods, the horizontal reinforcements being lapped to curved glazing is necessary—an important saving both in first cost and maintenance. It is unfortunately impossible to photographically the glazed coffer and the ribs, which in the illustration appear unduly prominent. The photograph, therefore, should be taken only the Cubitt Concrete Construction Co., of London, W.C.

R.I.B.A., ARCHITECTS.

MOSS'S REINFORCED CON-
CRETE SYSTEM.

Several examples are here shown of the reinforced concrete system employed by Messrs. William Moss and Sons, Ltd., in which the concrete is bound to the steel by means of looped straps, which at the same time act as shear members (see Figs. 1, 2, and 3). It is claimed that this system of binding the two materials ensures great rigidity, affording effectual resistance to sudden shocks or to such continual vibration as would occur from constant traffic or the working of machinery. This system was practically unknown in this country until it was introduced by Messrs. Moss, but it had already been employed for a long time, and to the almost entire exclusion of all other systems, by the Prussian Government in all public works in Berlin. The system there in use is the Pohlmann system, the sole rights for which in this country are held by Messrs. Moss and Sons. Messrs. Moss, however, hold their own patents for concrete reinforcement; and one of their improvements on the Pohlmann system ensures that the centre of gravity of the steel reinforcement shall occur much lower than it does

in the earlier invention. Moreover, it is important to observe that Moss's patent bars are exclusively rolled in England, in order to ensure that the steel shall always be up to the British Engineering Standards Committee's specification.

The coal bunker shown on p. 235 was recently completed by the firm for Mr. Cecil Walton, at Whitehaven, to carry 1,000 tons of coal: and the water tower illustrated on the same page is now being erected for Sir W. G. Armstrong,

Whitworth and Co., to carry 200,000 gallons of water. The tower is subjected to extraordinarily high pressures. The centre cylinder will carry 65 ft. of water—probably the greatest head of water in any reinforced concrete tank in this country.

The illustration of a concrete bridge that has been erected by this firm, and the plan showing their system of flooring, will, with the other illustrations, afford some indication of the wide range of service to which the system is applicable. The firm

by no means confine their attention to engineering works, but have executed a number of floors and other reinforced concrete structures that are of direct interest to architects.

Messrs. Moss lay stress on the desirability of reinforced concrete work being always designed by the architect, or by the responsible contractor under him, rather than by specialists who are not also contractors. It will be remembered that Messrs. Moss and Sons are the direct contractors to the Office of Works for the whole of the reconstruction work at the National Gallery.

MACHINE FOR COMPRESSION TESTS
OF MORTAR AND CONCRETE.

According to the new German standard specifications for Portland and iron Portland cements, the leading test is no longer that for the tensile, but that for the compressive strength. For this reason the manufacturers of testing machines have endeavoured to build a serviceable, simple and cheap compression testing machine of ample capacity and accuracy.

The requirements for such a machine are stated by Professor Martens as follows: (1) It ought to be constructed for 50 tons greatest capacity. (2) Its accuracy ought to be within 1 per cent. (3) It ought to be used in accordance with that accuracy, making allowance for the error. (4) It ought to be calibrated in a reliable manner. (5) It ought to be provided with two spring gauges with degree dimensions, each fitted with an independent stop valve and a frictionless maximum pointer; it is further advisable to instal at the side of the gauges a simple but reliable pressure recorder, in order to have as a check an automatic record besides the readings.

Testing machines, says Mr. H. Burchartz, in the "Engineering Record," constructed in accordance with these require-

ments are now built by several firms in Germany. The machine built, for example, by Oscar A. Richter, Dresden, is made of cast steel, is only 50cm. (20in.) high, can be easily placed on a table, and consists, as the accompanying illustration shows, of the press cylinder A, and the counter-bearing C screwed into the cylinder by a flat thread. The piston B, fitted with a leather-cup packing, moves easily in the cylinder, while at the head of the counter-bearing a spherical-topped plate D is suspended by means of a weak spiral spring. This plate, forming the upper bearing plate, is during a test forced against its bearing so that the pressure is distributed vertically and equally over the pressure surfaces of the specimen. The specimen E is set between two specially hardened steel plates F, which if necessary can be easily exchanged and faced by grinding.

A screw pump, connected to the press, is screwed into a bronze piece in which two valves are provided as inlets and outlets for the water. The water for the testing machine can be obtained from the city mains. One admission pipe leads from the press to the two control gauges.

SANITARY APPLIANCES.

The General "J" Catalogue issued by Messrs Twyford's, Ltd., sanitary potters, Cliffe Vale Potteries and Enamelled Fireclay Works, Hanley, Stoke-on-Trent, with show-rooms in London (120, Southampton Row), Birmingham, Glasgow, Manchester, Leeds, and agencies in many of the chief cities abroad, comprises 515 large quarto pages (10½ ins. by 12½ ins.), and is finely illustrated and sumptuously printed on art paper, as well as replete with practical information. It begins with a very useful "short description of the clay wares used in Twyford's sanitary appliances," namely—(1) white "C.V." earthenware, (2) "Adamant" fireclay, and (3) "Vitrina" fireclay: (1) consisting of a pure white clay body specially selected for its density and extra-fine texture; (2) a buff ware (which, however, may have a white finish) of great strength; and (3) an absolutely non-absorbent material. The various sections are respectively headed: Baths, Lavatories, Water-closets, Urinals, Sinks, Bidets, Specialities, and Accessories. Under each section there is much in pattern and arrangement that will be found helpful and suggestive; but perhaps the most instructive is that relating to Specialities, in which are included fixtures for hospitals, asylums, and other public buildings, as well as for several more or less special services. But, taking the catalogue as a whole, the architect and the sanitarian must find it invaluable for consultation, whether the dominant object be decorative effect or sheer utility.

GAS LIGHTING AND HEATING.

The current issue of "The Medical Magazine" contains an interesting report of some experiments recently carried out at the Lewisham Infirmary by the Medical Superintendent, Dr. F. S. Toogood, for the purpose (1) of comparing hygienically the relative values of the open fire and the gas radiator as heating agents; (2) of ascertaining whether, and to what extent, the atmosphere of a room is affected by incandescent gas burners and lamps; and (3) of ascertaining the hygienic value of the gas fire. Dr. Toogood's general conclusions are to the effect that "these experiments may be regarded as having proved conclusively":—(1) That in both large and small apartments which have normal means of ventilation, gas consumed in modern incandescent burners can be used for lighting without any detriment to health, being found, in fact, to assist ventilation by the increased circulation of the air. (2) That a gas fire, properly constructed and fixed, not only does not vitiate the air, but is a valuable adjunct to the ventilation of the room. Its advantages in the sick-room—in respect of its reliability, avoidance of noise, freedom from dust-producing propensities, and saving of both work and anxiety—are obvious to every professional man and woman. (3) That in large rooms, adequately ventilated, flueless gas stoves can be used for heating without any hygienic disadvantages, the heated products of combustion (mainly CO₂ and water vapour) ascending quickly above breathing level. This method of heating—by radiation and convection from flueless gas stoves—is economical, but proper ventilation of the buildings in which it is adopted is essential; which, of course, is also the case whatever means of heating be adopted. A ward or other public building in which gas radiators cannot be used with advantage is improperly ventilated.

FEDERATION NEWS.

Manchester, Salford, and District.

The annual dinner of the Manchester, Salford, and District Building Trades Employers' Association was held in the Marble Hall, Albion Hotel, Piccadilly, Manchester, on February 8th, the President (Mr. Harry S. Daniels) in the chair. The company numbered about eighty.

Amongst the guests who had accepted the committee's invitation were: The president (Mr. J. W. White), and past president (Coun. S. Smethurst, J.P.), of the National Federation of Building Trades Employers; Mr. Frank Woods, Bolton (President of the Lancashire, Cheshire, and North Wales Federation); Mr. Percy S. Worthington (President, Manchester Society of Architects), Mr. Henry Price (City Architect), and representatives from the Councils of the City of Manchester and Borough of Salford.

Mr. George Macfarlane, J.P., proposed the toast of the "Manchester Society of Architects," and a résumé of his speech was given in last week's issue of the Journal. This toast was responded to by the President of the Manchester Society of Architects (Mr. P. S. Worthington) and the City Architect.

The toast of the "National Federation of Building Trades Employers" was proposed by Mr. Henry Matthews, J.P., and responded to by Mr. J. W. White, the National President, the latter referring to the far-reaching effects of the Workmen's Compensation Act, and the heavy burden it imposed on employers in the building trades.

Mr. William Tinker proposed the "Lancashire, Cheshire, and North Wales Federation," and Mr. Frank Woods, Bolton, President of the Lancashire, Cheshire, and North Wales Federation, in responding, complained of the difficulties that arose from trade unions allowing their members individual freedom of action, without consideration of any agreements they had entered into with the employers' organisations through their National committees.

The toast of the "Municipalities of Manchester and Salford" was proposed by Mr. T. A. Locan. Ald. J. R. Wilson (chairman of the Improvements Committee for the City of Manchester), and Ald. G. T. Jackson (chairman of the Building and Bridges Committee for the Borough of Salford) responding.—JOHN TOMLISON, Secretary.

COMING EVENTS.

Friday, March 3.

ARCHITECTURAL CRAFTSMEN'S SOCIETY, Glasgow Technical College.—James S. Boyd, Licentiate, R.I.B.A., on "A Study of French Masonry." 8 p.m.
ROYAL SANITARY INSTITUTE, 90, Buckingham Palace Road, S.W.—Prof. H. R. Kenwood, M.B., on "Elementary Statistics." 7 p.m.

LEICESTER AND LEICESTERSHIRE SOCIETY OF ARCHITECTS, 5, St. Martin's East, Leicester.—Arthur Wakerley, F.R.I.B.A., on "The Growth and Development of Leicester." 8 p.m.

Saturday, March 4.

ARCHITECTURAL ASSOCIATION, 18, Tufton Street, Westminster.—Third Spring Visit, Recruiting Station and Stables, Whitehall. Meet at building, 2 p.m.

Monday, March 6.

ROYAL SANITARY INSTITUTE, 90, Buckingham Palace Road, S.W.—Prof. H. R. Kenwood, M.B., on "Water: Composition, Pollution, and Purification." 7 p.m.

ARCHITECTURAL ASSOCIATION, 18, Tufton Street, Westminster.—A. R. Jemmett, F.R.I.B.A., on "The Functional Application of the Orders to Modern Buildings." 7.30 p.m.

LECTURES ON MEDIEVAL ARCHITECTURE, Lecture Theatre, Victoria and Albert Museum.—Banister Fletcher, F.R.I.B.A., on "German Medieval Architecture—the Romanesque Period." 5 p.m.

SOCIETY OF ENGINEERS, 17, Victoria Street, Westminster.—E. Scott-Snell, on "Petrol Air-Gas," at the Institution of Electrical Engineers, Victoria Embankment (near Waterloo Bridge). 7.30 p.m.

Tuesday, March 7.

ROYAL SANITARY INSTITUTE, 90, Buckingham Palace Road, S.W.—E. J. Steegmann, M.B., on "Elementary Science: Physics, Chemistry." 7 p.m.

GUILD OF ARCHITECTS' ASSISTANTS, Prince Henry's Room, 17, Fleet Street, E.C.—E. J. Dixon, A.R.I.B.A., on "The Town Planning Agitation." 7.30 p.m.

LECTURES ON ANCIENT ARCHITECTURE, Lecture Room, British Museum.—Banister Fletcher, F.R.I.B.A., on "Basilican Churches Outside Rome; Baptisteries, Tombs." 4.30 p.m.

Wednesday, March 8.

WORTHFUL COMPANY OF CARPENTERS, Carpenters' Hall, London Wall, E.C.—Noel Heaton, B.Sc., F.C.S., on "The Use of Glass in Building." 7.45 p.m.

ROYAL SANITARY INSTITUTE, 90, Buckingham Palace Road, S.W.—E. J. Steegmann, M.B., on "Elementary Science: Physics, Chemistry." and lecture. 7 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION, 6, Higham Place, Newcastle.—Meeting of Council, 7 p.m. Association Ordinary Meeting, 7.30 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Council Meeting, 4.0. J. H. Sellers on "The Architect's Use of a Library." 6.30.

Thursday, March 9.

SOCIETY OF ARCHITECTS, 28, Bedford Square, W.C.—W. S. Frith on "The Relation of Sculpture and Carved Ornament to Architecture." 8 p.m.

Supplement to THE ARCHITECTS' AND BUILDERS' JOURNAL, Wednesday, March 8th, 1911.

NORTH PAVILION OF SCHEME FOR THE REBUILDING OF REGENT STREET, LONDON, BETWEEN NEW BURLINGTON STREET AND CONDUIT STREET
FRANK T. VERITY, F.R.I.B.A., ARCHITECT.

THE ARCHITECTS' & BUILDERS' JOURNAL.

WEDNESDAY,
MARCH 8th, 1911.

No. 841.

BAY OF CEILING, ELIZABETHAN HOUSE, CROSCOMBE.

(See page 254)

This hall is capable of seating 250 persons, with another 80 in the gallery. The joinery is of fumed oak and the ceiling of fibrous plaster, modelled by Mr. C. H. Mabey, of Westminster, who also carved the caps of the pilasters. The architects were Messrs. Withers and Meredith, F.F.R.I.B.A., of 50, Cannon Street, E.C., and the contractors were Messrs. Somerford and Son, of Clapham.

NEW HALL, QUEENSWOOD SCHOOL, CLAPHAM PARK, LONDON, S.W. WITHERS AND MEREDITH, F.F.R.I.B.A., ARCHITECTS.

THE ARCHITECTS' & BUILDERS' JOURNAL.

The Architectural Development of London.

It was said once by an eminent English novelist, that Paris was a city, and London a collection of large villages. The statement was no doubt somewhat exaggerated, perhaps consciously and with the intention of producing an effect; but in a wide sense there is a great deal of truth in it, and it was brought to our recollection in

reading over the published papers and discussion on the subject in the current issue of the Institute Journal. For it represents exactly the point which the speakers who took part in the discussion totally failed to see. Both the First Commissioner of Works and Professor Pite wandered off into the declaration that London possessed a great many beautiful buildings; perhaps Professor Pite, in his enthusiasm, a little over-stated the case; but we quite agree in the main. As far as the Houses of Parliament are concerned, we should be prepared to go further than either speaker, and to say that it is one of the finest architectural conceptions in the world, ancient or modern, and that it is to be regretted that so few Englishmen seem to be aware of the fact. But all this is not to the purpose. It is no use saying that we have fine existing buildings if (1) we cannot prevent bad ones being erected in important situations, and if (2) we do not know or care how to place the good ones. It is the second which is the more important consideration of the two, and the one least understood. It is the want of understanding it which has led to that difference between Paris and London which is signalled in our novelist's drastic criticism; it is the want of understanding it which led the First Commissioner, if we remember right, to make a remark (not formally reported in the Institute Journal) on the absurdity or unwisdom of people praising foreign cities and discrediting their own. It is because, in some foreign cities, at all events, they see an attention to the placing of buildings and the axiality of streets and squares which they do not see in London; and if Earl Beauchamp cannot appreciate the distinction, he evidently does not understand the essential difference between a "city" and "a collection of villages." Stateliness is the especial quality of a city; picturesqueness that of a country town or a village. That there are other people besides the First Commissioner who cannot understand this is evident enough; the evidence received its climax in the speech of a painter who maintained that the picturesque in cities came about by unforeseen accident, and not by contrivance, and instanced the fine effect of Somerset House rising above the Embankment, which had been made without any preparation for such a building being subsequently erected over it!

Mr. Rickards, we gather from his paper, fully recognises this. He looks at a city as a whole. He remarks how closely related comparatively distant landmarks seem when their surroundings are in harmony; "compare, for example, the apparently close relationship of portions of Paris with what seems undue separation between others in London." Nothing could be better put or more to the point. Paris, as a city, is a whole; London is not. And he makes a comprehensive and far-reach-

ing observation in another direction, in pointing out that, apart from the practical advantages of direct communication, there is no artistic gain in such London developments as Kingsway and its approaches, if the improvement is carried no further than as it exists on paper, "and is confined to one dimension"; a good way of expressing it. He adds: "It may be argued that the general lines are laid down for posterity, to be decorated by works of art of a more enlightened age. That is certainly characteristic of our usual method of half measures, and the British way of missing the spirit of an imported idea in its entirety." It may be added that there is not much space left for the more artistic decoration "in a more enlightened age," if the new street has been to a great extent filled up with buildings of inferior architecture, which will become properties not easily got rid of. This is the dilemma which we called No. 1 above. It is not much use having perhaps one or two really good buildings in a new line of street, if we are unable to prevent the erection of inferior ones on the remaining sites.

But dilemma No. 2, the want of any right perception as to the placing of buildings which are good in themselves, is the more serious of the two, and the one which is least realised. Even Mr. Rickards does not seem quite to realise it, for he refers to the Albert Hall as having provided "a focal point very rightly placed"; but he does not mention the characteristic fact that the Albert Memorial, which is connected both in sentiment and architecturally with the Albert Hall, is perceptibly out of axis with it. How many people in London, we wonder, either know or care about that? Yet in Paris such a blunder would have made the authors of it a public laughing-stock. Take one or two other examples. There is the Constitution Hill Arch, moved from its original monumental position at the bidding of an irrepressible First Commissioner, who, under the influence of zeal without knowledge, made his reign a most mischievous one for London; placed facing towards an irregular space with no architectural form and no architectural centre, cut up by road-lines into a series of shapeless patches of ground; a plan which is that of an estate-agent, not of an architect. Yet this so-called improvement received at the time the unanimous commendation and congratulations of the daily Press; and that it was a mistake people are only just now beginning to find out, some thirty years or more after date. Then there is the even worse failure of what is satirically (one might think) called "the Marble Arch improvement," where the arch is left standing at one side of a piece of roadway not even parallel with it, because that line of the road was supposed to be more convenient for traffic. If the official authorities who control these improvements have not yet learned that there is anything to be considered in them except traffic lines and police control of traffic, they have not yet learned the rudiments of their business. Then there is the small artillery memorial in St. James's Park, closely facing the York column and steps, and yet put deliberately out of axis with them, apparently to save moving a few feet of railing and sidewalk. And now there is the Bill for a new bridge over the Thames, a scheme shown, to use Mr. Rickards's happy expression, "in one dimension only,"

the design of the bridge being entirely evaded, and the roadway planned so as to treat St. Paul's Cathedral not as a central object to lead up to, and govern the whole, but merely as an obstacle to be skirted. All this is what comes of neither the public nor the official authorities having any idea of the importance of axial laying-out in cities.

Mr. Waterhouse's elaborately worked-out scheme for the appointment of an architect for each borough of London, and a central architect with supreme authority, whose special duty should be to secure the best architectural laying out of new streets, and the best architecture in them when laid out, will be startling to many for its boldness and extended scope; but there is nothing to prevent its being carried out except public indifference to the subject. Mr. Waterhouse's proposed provisions—that the architects appointed should be the highest men in the profession; that in order to secure these there should be no limitation of private practice; that they should be appointed only for three years certain, with the appointment renewable or not, according to circumstances; all these are wise suggestions which would go far to ensure the success of such a scheme. But there must be a supreme head, whose duty it would be to supervise schemes of London improvement as a whole, the borough architects looking after the details. To the supposed objection to giving such "awful supremacy" into the hands of one man, Mr. Waterhouse replies, quite truly, that the "awful supremacy" exists, whether or no, and that it is wiser to fill it with a man than to leave it occupied by a vacuum. In short, a great deal is unquestionably going to be done in London before many years are out, in the way of alteration, and what ought to be improvement; is it to be done under proper architectural control or to be left to haphazard? If it is to be done under proper control, the machinery for that control has to be provided.

One curious anomaly in connection with the subject of London improvements is that some of them, owing to reasons of administration, come under another authority, that of the Office of Works, who might decide a problem in a manner quite different from what would be recommended or desired by the proposed municipal controlling architect. The incidents of London improvement which have come under the control of the Office of Works have not been very numerous, but they have occasionally been very important, and they have for the most part been very badly dealt with. This is only the natural result of the system under which the office of First Commissioner of Works is made a political and party appointment. It is, notoriously, a means of finding a place for a junior member of the party in power at the time, and is practically regarded merely as a political halfway house to something considered to be of more importance. Naturally, therefore, the selection to this office is not made with any regard to special knowledge of architectural subjects; and to find an instance of a First Commissioner who had any real power of dealing with architectural problems we must go back half a century, to the days of Sir Benjamin Hall. Anyone who reads the contemporary accounts in connection with the old Foreign Office competition will recognise that Sir Benjamin Hall, who was First Commissioner at the time, was a man of real critical perception in regard to the architectural treatment of Government buildings; and we cannot recall that there has been any First Commissioner since his time of whom this could be said. The fact is that the position of First Commissioner of Works ought not to be a political one at all; the appointment ought to be permanently conferred, without distinction of party, on some one specially qualified for it, who would retain the post independently of any changes in the Government. Until this is made the rule, one cannot be surprised to find that the Office of Works contribute little to the architectural improvement of London. It could hardly be expected to be otherwise under such radically illogical conditions, "illogical" being the mildest word that can be applied to a condition of affairs that obviously ought not to be tolerated by a public having the slightest claim to a sense of fitness.

Decorating London for the Coronation.

IT appears that the Government of New Zealand has applied for permission to erect a triumphal arch on the line of route of the Coronation procession; the probable site for the trophy (if permission is given) would be some position in Whitehall between the Duke of Cambridge statue and Trafalgar Square. With a vivid recollection of the preposterous erection which the Government of Canada was allowed to erect in the same position at the last Coronation, we can only say that we hope a condition will be made that the arch should be designed by an architect, or the design submitted to some competent architectural judgment before its erection is sanctioned. The Colonies seem, as far as we have had any instances in this country, to have not the slightest idea of doing such things in an artistic manner; they never seem to soar any higher than the idea of piling up examples of their industrial and agricultural products in the form of an arch or pyramid *rudis indigestaque moles*—presenting economic facts in a crude form. An arch of the kind ought to be a work of art, or it is better away. But the whole question of the decoration of London for this great occasion ought to be considered and dealt with in a consistent artistic spirit. Sir William Richmond and two or three other artists of note have addressed a letter to the City Council of Westminster urging this view, and offering their services gratuitously in working out a scheme. It is to be hoped that the offer will be accepted and acted upon in the spirit in which it is made; too often, in this country, any such offer is resented as an intrusion. One detail we may suggest in connection with the subject. As it is understood that the way will now be cleared for the use of the processional road from Buckingham Palace into Whitehall, it is surely time that the commonplace electric light standards erected by the City of Westminster along the Victoria Memorial Road should be removed and replaced by something better. That they are only temporary we have several times been told; but they have been temporary for a long time now.

The Structural Problems of Winchester Cathedral.

THE problem of dealing with the south aisle of the nave of Winchester Cathedral is exercising the minds of the Dean and Chapter to a great extent. Although the aisle is shored up with heavy timbers, a constant movement is taking place, and tallies put over the cracks part to such an extent in ten days that an ordinary box-ruler can be inserted edgewise. Closer examination in the nave reveals conditions which are the cause of great anxiety. The whole nave stands on treacherous soil, but running in a northerly direction from the south across the part where are William of Wykeham's chantry, the famous black marble Tournai font, and Jane Austen's grave, there is a broad tract of peculiarly bad conditions, with 5ft. of peat and 3ft. to 5ft. of soft silt. Wykeham's chantry is cracked and crushed, and there are unmistakable indications that the piers on both the north and the south side of the nave are gradually sinking. The result is that the heavy weight of the south aisle vaulting is thrown on the south wall, which is unable to withstand the thrust, and is being pushed outwards. This presents a problem which is exceedingly trying, in view of the fact that it means an increased appeal to the nation. Difficulties are apparent, but they can be overcome, provided ways and means are forthcoming. Underpinning for the south wall is the first necessity, and this has just been begun, but it is impossible to guarantee stability for the structure unless additional means of support are provided.

The removal by Bishop Horne of the ancient Norman cloisters is responsible for much of the weakness of the wall. Mr. T. G. Jackson, R.A., has recommended two methods of strengthening it—one by means of ordinary Perpendicular buttresses in harmony with Wykeham's work against the ancient flat Norman buttresses, and the other by means of a cloister buttress, with a flying buttress above. The latter is the more expensive, but it is regarded as by far the most effective, and

if the series are turned into a proper cloister, mediæval in character, it is suggested that all future monuments shall be placed here. Models of these two designs, in wood and canvas, were placed *in situ* recently against the south wall, and inspected by the Dean and Chapter, but it is understood that Mr. Jackson has been asked to prepare a third scheme. In all probability the piers of the nave will have to be underpinned, as well as the south wall buttressed, and in that case a large sum of money beyond that already asked for will be necessary. While the work on the south transept is approaching completion, and the fencing is being cleared away under the slype, where enormous buttresses have been built, it is by no means certain that the south wall is safe. The wall is roft, thick, and is out of plumb to the extent of half of that amount. On the north side and at the east end the Cathedral is now quite safe; indeed, the measures which have been adopted have proved most effectual, and the building is on a surer foundation now than it has ever been before.

In excavating on the south side of the nave within a few feet of the west front, for the diver to begin operations, the workmen recently came across a very fine specimen of Roman tesserae at a depth of about 9ft. below the surface. It measures $3\frac{1}{2}$ ft. by 2ft., and is of rich design, similar to that found some years ago in Little Minster Street, which is preserved in the City Museum. The fragment, which is in an excellent state of preservation, was lifted out bodily and without disturbance, and has been placed with the collection of relics found during the progress of the work. Among other articles found at the same time were a late Roman lamp in earthenware and a mediæval candleholder.

The Annexe to Westminster Abbey.

WORK has just been started on the annexe to Westminster Abbey, which is to be used in connection with the Coronation of King George. It has been designed by Mr. A. Y. Nutt, of the Office of Works, at Windsor Castle, and will be similar to the temporary building which was erected for the Coronation of Edward the Seventh. The annexe of 1902, which was also designed by Mr. Nutt, so closely resembled in style the west end of the Abbey, which it adjoined, that visitors who were not familiar with the Abbey found it difficult to realise that it was only a temporary addition. The building was composed entirely of plaster and wood and the exterior was skilfully "toned" to resemble the grey stones of the Abbey. There were niches on the west side, in which were placed statues of the seven King Edwards, and some of these will possibly be used again. The annexe will be rectangular, with an entrance hall and retiring rooms on the side facing Westminster Hospital. The interior will present the appearance of a baronial hall, with its timbered roof supported by wooden piers and arched beams, and its walls covered by tapestry and arms. The annexe will be about 112ft. by 60ft., by 24ft. It will be used as a robing room, from which those who are attending the service will pass direct to their seats in the Abbey. The work within the building, including galleries and platforms for spectators, is being carried out by Messrs. John Mowlem and Co., and one of the conditions of the contract is that not a single nail or staple shall be driven into any part of the fabric, and that no braces or beams shall rest on or against the pillars and walls.

The National Town Planning Conference.

THE National Town Planning Conference at Liverpool was largely and rather literally occupied with the groundwork of the subject, a great part of its two days' meetings being taken up with the consideration of problems, some of them suddenly and unexpectedly propounded, relating to peculiar local circumstances, with respect to property in land, and to diverse industrial and other conditions which appear to complicate the issue. Indeed, the delegates seemed so eager

to impart information upon these fundamental matters that the conference must have been as instructive to the experts who convened it as it was to the invited delegates, thereby the more completely vindicating its title of "conference." It is doubtful, however, whether, in assuming this aspect, the proceedings did not take rather an unexpected turn; the Advisory Council having, apparently, had on this occasion but few opportunities of disseminating the knowledge which for some time past they have been steadily accumulating; while some of the numerous questions with which they were bombarded bore a suspicious resemblance to "heckling." The practical outcome of the conference is hardly yet evident. There was but a casting of bread upon the waters; but evidently the Council are prepared to "let Patience have her perfect work," and to go on gladly learning and gladly teaching on a subject that luckily grows in interest, as well as in difficulty, as investigation proceeds. There is, of course, some danger in diffuseness; but there is even greater danger to be apprehended from the narrow sectionalism of which signs are never wanting in any great movement. The architect and the builder, by throwing themselves heartily into the movement, may do much to prevent the excesses of sentimentalism on the one hand, and of cupidity on the other.

The late Herr Von Uhde.

BY the death of Herr Von Uhde, Germany and the world loses a remarkable religious painter, who treated New Testament narrative and New Testament personages in a spirit of his own. His art was a reaction against conventionality in religious painting. In treating scenes from the life of Christ, he thought he could give a new reality to them by depicting the personages grouped round the sacred figure as if they were studied from those seen around him in the daily life of his own day. Rembrandt had done the same, probably without thinking about it, and in a spirit of naïveté; Von Uhde did it on principle, and as the best way of appealing to modern feeling. It was illogical in a sense, no doubt; but his pictures, some of the principal of which were exhibited some years ago in London, were full of genuine pathos and expression. He was a powerful painter in a technical sense, and possessed by a very earnest spirit in his art.

King Edward Memorials: King George's Wish.

IT having been stated by Lord Knollys that King George prefers non-equestrian statues of the late King, Bristol has decided to substitute a statue representing the late King standing in his robes. Sheffield had favoured the idea of an equestrian statue, but the Lord Mayor of that city has stated that the wishes of King George, now that they have been made known, will undoubtedly be respected. These circumstances seem to complicate the Liverpool difficulty, where equestrian statues are of the essence of the scheme for tampering with St. George's Hall. It is to be hoped that the promoters of that scheme will also perceive the necessity of respecting King George's expressed view. The citizens of Sheffield are turning their attention to one or two alluring schemes of town planning in which the late King could be worthily commemorated by the creation of a King Edward Square, or alternately by street improvements near Fitzalan Market.

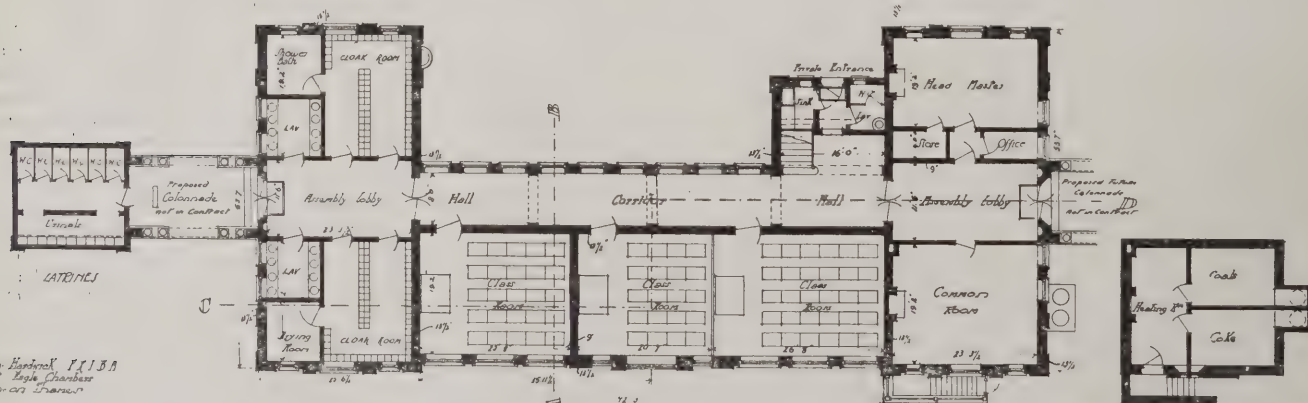

The Access to Conway Castle.

FOR the past four years the Conway Town Council have been considering how best to improve the means of access to the ancient castle of Conway, without detriment to its historic character and aspect. The castle stands on an eminence of limestone rock, the level of its courtyard being perhaps a hundred feet above that of the street from which the present staircase and sloping pathway ascend. The pathway is necessarily steep, and is so narrow, especially at the lower end, that only one person can pass along it at a time. When events take place in the castle which attract

a numerous gathering of people, the very narrow, bottle-neck exit is a source of possible danger. On the opposite side of the Gyffin Road, which skirts the western end of the castle, and at the corner of which the entrance is situated, stands the Guild Hall, the building in which the meetings of the Council are held. It is approached by a flight of steps, and the latest scheme (says the "South Wales Daily News") for a new way into the castle is that the Guild Hall stairway should be made use of, and that an appropriate bridge should be built over the Gyffin Road to connect with the present

pathway to the castle at a point sufficiently far back to allow of the widening of the main road. The Gyffin Road is in a cutting through the rock, so that the land rises on either side, and it would be possible to place the bridge across it either just above the Guild Hall doorway or further from the main road. Mr. Douglas, of Chester, has supplied plans and designs for both these proposals, and he has been asked by the Council to draw out estimates of the cost of both schemes. When these are received a full-sized model (in timber and painted cloth) of the proposed bridge will be put up.

COUNTY BOYS' SCHOOL, MAIDENHEAD. A. JESSOP HARDWICK, F.R.I.B.A., ARCHITECT.

COUNTY BOYS' SCHOOL,
MAIDENHEAD.

This design for the Maidenhead Secondary School for Boys was awarded the first premium in open competition, in which 145 designs were submitted to the assessor, Mr. R. S. Wornum, F.R.I.B.A.

The school has recently been completed. It is erected on a site of four acres, on high ground overlooking the town, and provides accommodation for 150 boys.

The plan is arranged so that extensions could be easily and economically made without disturbing the working of the school or interfering with the general scheme.

The design is of Georgian character, executed in red bricks of varying shades; relieved in its central parts by stone sparingly employed, and the roof is covered with red sand-faced tiles. The school is planned in two storeys, with all departments under one roof. Both floors have through corridors running practically from end to end. On the first floor is a spacious assembly hall, which is also used

as an art room. The corridors are divided in their lengths by a series of arches, and the floors are paved with jointless flooring of a deep red colour, the dadoes being formed of glazed bricks of a light golden green, with two narrow rows of small tiles to match.

The heating and ventilation installation has been carried out by Messrs. Rosser and Russell; the fireproof floors by Messrs. Homan and Rodgers; the gas lighting and fittings by Messrs. Christie's; the stone carving and plaster modelling in the hall, and also the principal rain-water heads, are by the Bromsgrove Guild of Handicraft. The leaded glass work, the entrance gates, and metal work, by Messrs. Humphries, Jackson, and Ambler; the fencing by Messrs. E. C. White, of Basingstoke. The furnishing is by the Educational Supply Co., to designs supplied by the architect, Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames. The contractor was Mr. J. B. Seward, of Wokingham; Mr. R. Squelch being clerk of works.

A REMARKABLE WATER-COLOUR
EXHIBITION.

The exhibition of water-colours at Messrs. Agnew's Gallery, in Bond Street, constitutes a quite remarkable opportunity of comparing and analysing the methods of different schools of water-colour, old and new. Though the collection is not a very large one numerically, almost every style of English water-colour is represented there, from the severely built-up composition of Varley's "Classical Landscape" to the delicate and finished detail of Mrs. Allingham's foreground scenery of cottage, trees, and figures. Varley seems conventional in comparison, but that is partly because of the restricted palette of the old water-colour period, which made anything like realism of colour impossible, and threw back the artist on resources of composition rather than of colour. De Wint had more colour available, but still relied greatly on composition, in which he is almost unequalled. One is able to see in this collection that David Cox, however much we owe to him for laying the foundation of a broad and what we may call a "wet" style in watercolour, occasionally let his breadth become too "blottesque." The central perfection of water-colour style is perhaps to be seen best in the works of the late Thos. Collier, of whom there are one or two splendid specimens. It is instructive to contrast these with the comparatively flashy and artificial effects of Copley Fielding, once regarded as a great light in watercolour, but who looks sadly weak and unreal by the side of Collier and his follower Wimperis. There are a good many examples of the smaller works of Turner, and one exquisite example of the modern landscape-painter who came nearest to Turner, A. W. Hunt, whose "Valley of Dolwyddelen" contains the most remarkable rainbow we have ever seen in water-colour, though its luminous effect was even surpassed in his larger oil-painting of the same subject. The exhibition affords an admirable opportunity for the study of style and effect in water-colour.

COUNTY BOYS' SCHOOL, MAIDENHEAD. GROUND FLOOR CORRIDOR & STAIRCASE.

Enlargement of Hampstead Town Hall.

Hampstead Town Hall is to be enlarged by the erection of a new building and alterations to the existing structure; the total cost of the work being estimated at £12,000. Mr. John Murray, F.R.I.B.A., is the architect.

THE ORDERS AND MODERN BUILDINGS.

BY A. R. JEMMETT, F.R.I.B.A.

In his paper on "The Functional Application of the Orders to Modern Buildings," which was read before the Architectural Association on March 6th, Mr. A. R. Jemmett, F.R.I.B.A., put forward the view that a structural feature may also perform functions that are not essentially structural.

ON thinking over the wording of the title—"The Functional Application of the Orders to Modern Buildings"—it seemed evident to me that the accent should be placed on the word "functional"—the application of the Orders in such a way as to fulfil a function.

A "Fundamental Mistake."

Now, we are all aware that some people may question the legitimacy of the whole proceeding; may contend, with much show of reason, that you cannot rationally apply the Orders to modern buildings—whether functionally or otherwise—particularly in this country, where Classic architecture is only an imported plant. Such people may well hold that the Orders, as perfected by the Greeks, were a natural production of the time and circumstance; that they were suitable to that time and those circumstances only; that they were applied by the Romans indiscriminately and without any real understanding—sometimes rationally, sometimes irrationally; that where they applied them functionally it was as much a matter of accident as of design; that the same remarks apply to the period of the Renaissance, which, as a matter of fact, was a fundamental mistake, turning architecture from the true path of progress and keeping it there ever since.

This is a point of view for which I have the greatest respect, but it is not the subject for discussion this evening. Obviously also, it would be most inconvenient to admit it here, as the admission would bring this inquiry to an abrupt termination. I will merely refer those who hold it to the dictum attributed to M. Duc, Grand Prix de Rome and architect of the Salle de Pas Perdues, of the Palais de Justice at Paris: "There is no architect without the Orders"—just to remind them of another point of view, and leave them to make what they can of it.

It seems necessary for our purpose to consider Classic architecture as much an acclimatised or naturalised citizen as a Lombardy poplar, a French partridge, or a Jersey cow; as much a home product as a Brussels carpet or a French case-ment; and to grant the legitimacy of the application of the Orders, provided they are applied in such a way as to perform a function. What are these functions? And how may the Orders be best applied so as to fulfil them? These seem to be the questions before us to-night.

Feature and Function.

It is, I suppose, the orthodox standpoint that, as architecture is a structural art, the chief function of each individual feature is a structural one. It is, I believe, contended that no feature has a right to exist except in discharge of some structural necessity, and that its value as architecture depends on the degree of success with which it exactly fulfils that function. Far be it from me to deny it, but I venture to suggest it is true only as far as it goes. The truth, perhaps, but not the whole truth.

If we consider for a moment the use of the Orders as elaborated by the Romans, and again by the earlier Italians,

we must admit that they often applied them in a way that was not strictly structural—as, for instance, in the Colosseum, with its concrete structure faced with superimposed tiers of applied Orders in stone—or in any colonnade with its intercolumniation too wide for the depth of its architrave.

Here we get features which are not exactly structural. The architrave, for instance, does not bear as a lintel from column to column as it would have us believe, but either includes the frieze in the same stone to get depth for the bearing, or else is jointed like an arch. When we remember that such features are to be found in most of the buildings since the time of the Greeks, where the Orders have been applied, we realise that, if we are to adopt the standpoint that the function of every feature is structural and structural only—if we take a strict view and refuse to admit any feature that is not an absolute structural necessity—it is evident that our use of the Orders will be extremely limited, and that there is very little scope for their application to modern buildings.

Building as Work of Art.

I would venture, then, to put forward the point of view that, although the chief function of every feature may be structural, yet it may perform other functions equally necessary to the completion of the building as a work of art. For we must remember that the structure of a building has not only to serve a practical purpose, but also to express that purpose in its general appearance. That although this purpose may be—indeed, must be—to some extent expressed in the general lay-out and grouping of its structural masses, yet this expression is not complete. These masses have to be shaped, modelled, and decorated, to draw out, heighten, and complete that expression. For although the general arrangement and structure of the building may, after examination and critical analysis, prove satisfactory to the mind, yet it has to appeal through the heart to those not capable of this analysis; and to those who are capable it has to make its appeal with a swiftness that does not allow time for conscious analysis—an instantaneous, instinctive, emotional appeal which subsequent critical analysis should only confirm.

If this be so, then the features employed in this process of drawing out and accentuating the expression already inherent in the general lay-out and structural grouping, to obtain this instantaneous emotional appeal, are performing a function, not altogether structural perhaps, but none the less necessary. If we use the Orders for this purpose we may, I think, be said to be applying them functionally. It is in this way that they were used by the Romans and the architects of the Renaissance.

Orders Functionally Applied.

If we endeavour to elaborate and illustrate this point of view, we perceive that the Orders may be applied in many ways, all more or less functional; that it is possible for an Order to fulfil a structural

function without necessarily fulfilling an expressive one; or an expressive but not a functional one, or both, or neither, and that their value varies accordingly.

For example, the main entrance to a large public building may need a porch or outside shelter, and for this purpose an open portico with columns and pediment may be erected. Here the Order may be so constructed as to fulfil its structural function, while at the same time the whole portico may serve to express and accentuate the entrance, and this expression may be more exactly obtained by the treatment of the detail and decoration of the Order in harmony with the purpose and character of the building.

In this case the Order seems to serve the functions both of structure and expression, but if the same portico is taken from the entrance and placed at random against some other part of the building, where it serves no practical purpose, the Order, no doubt, may still be so constructed as to serve its structural function of supporting its own roof, but it no longer fulfils the function of expressing the arrangement and purpose of the building. In fact, it has become a misleading feature, confusing the expression, however structurally perfect it might be in itself.

Expressing the Character.

Again, we all know the usual arrangement of a small group of municipal offices: offices on the ground floor with a central entrance, council-chamber on the first floor over the entrance, with smaller committee-rooms on either side. Where the council-chamber committee-rooms are given a height in proportion to their relative sizes, we get a structure which by its arrangement and its general grouping and outline expresses up to a certain point, simply by these means, the character and nature of the building. If, then, it is proposed to intensify and complete this expression by the application of an Order to the council-chamber, and perhaps a secondary one to the two committee-rooms forming the wings, so as to emphasise the fact that these are the important rooms, the Orders seem to perform a function of expression, and therefore to be legitimate, even though they are not required structurally. If, however, the actual columns or pilasters are not just applied to a wall already sufficiently strong, but form part of the wall itself, and are actually necessary for the support of the roof, being so spaced as to take the roof principals, they seem to perform a structural function also, and to have a greater value still as a means of expression, for they tell us more of the nature of the building. Arranged irrespective of the construction, they tell us something, and so have a certain value; arranged to express the construction, they tell us more, and so have a greater value.

But the point I wish to emphasise is that even if they perform no actual structural function, they may be used as means of expression in places where they are not a structural necessity, provided they are used in conformity with the laws of architectural expression.

Emphasising the Wrong Thing.

This seems to be the important point. The first thing necessary is to put the Order in its right place in the composition, where it expresses the right thing. If it is also structurally applied, so much the better, but this is a secondary consideration. An Order performing a structural function applied in the wrong place, where it emphasises the wrong thing, con-

fuses the expression of the building as a whole, and is worse than useless. In such a case its structural application does not interest us much. If on approaching a public museum we see a grand portico with pediment, and, taking this for the main entrance, we mount the flight of steps only to find ourselves confronted with a blank wall, or with a small door marked "Private" leading to the offices, it is no comfort to us to reflect that the Order has been applied to fulfil the structural function of carrying its own roof. As we wander round the building in search of the entrance, we are in no mood to admire its structural perfection. All we feel is that we have been taken in shamefully, and that we want the front door. Later on we may find time to reflect that even structural perfection itself is no good in the wrong place, and that the whole thing is a false idea and just a waste of so much good stone and honest craftsmanship.

The use of the colossal Order rising through two or more floors, a treatment which is just now so popular, is rather a difficult matter to handle. You can look at it in so many ways. As a method of expression it looks utterly false at first glance; but, after all, there is something in it. There are other things to express besides the obvious physical fact that the building is divided into several storeys.

Choice and Necessity.

Suppose you have to supply an acre of accommodation for some commercial purpose, the whole of the accommodation being of the same character throughout; and suppose the most convenient way would be to arrange it all on one floor. If the site is large enough, you would do this; but if it is only a third of an acre you have to divide it into three and place three floors one over the other.

Now, you do not do this because it makes a better or more convenient arrangement; quite the contrary. You do not do it because you want to, but because you have to. It is not the strong point, but the weak point of the design; you therefore do not want to say too much about it. It is a fact to be frankly recognised, but not unduly emphasised; you do not want to make a song about it. If, then, instead of emphasising each floor with a small Order, you include them all in one large one and express the floors with the windows rather subordinate features, you get obvious facts frankly recognised without undue emphasis, while the large Order, by its scale and treatment, seems to convey a truer suggestion of the unit of the building as a whole, and the nature and relative importance of the commercial concern of which it is the expression.

If, however, the three-floor treatment is a vital necessity of arrangement—a characteristic feature of this class of building—it would then be proper duly to emphasise the fact by boldly marking the three floors. To do this with an Order for each floor would perhaps be logical, but as a method of expression it seems rather crude and a needless elaboration of the obvious.

If we use this large Order, let us take care that we mean something by it, that it is suggested by the nature of the building, and not by the present tendency to bigness of scale. Rightly used, it seems to be a most flexible medium by which we can draw out from the building the most subtle shades of expression, wrongly used, nothing can be more misleading or better adapted for confusing expression.

Misleading Effects.

Imagine a building of four storeys all of the same character and importance, where there is no reason for accentuating one rather than another. To treat the ground floor as a basement to an Order rising through the first and second, and then to put the third in the attic, may produce a pleasing but most misleading effect. But if the different floors have each a separate and distinct character—say the different departments of a Government office—and there is something in the nature of the first and second to suggest that they be coupled together and emphasised, there seems no reason why this should not be done with an Order.

There are many other points, such as the expression by means of a large Order of a hall set back from the front and masked by several floors of small rooms, which it would be interesting to examine if the time at our disposal permitted.

As this paper is not intended to be a study in architectural expression, I will content myself with the suggestion that the principal value of the application of the Orders to modern buildings, taken into consideration our rapidly changing methods of construction and complicated practical requirements, is chiefly as a means of artistic expression; that used in this way they fulfil a function.

A Guiding Principle.

The principle that seems to guide us in their application is that they must in all cases obey the laws of architectural expression, and that a right method of expression is the essential thing. If in so doing they can also fulfil a structural function, so much the better, as the expression becomes more complete. They cannot, however, be applied to serve a structural function in defiance of the laws of expression—for the expression, not the construction, is the essential thing.

Perfection of mechanical structure is satisfying only to the mechanic. If it satisfies us, why use the Orders at all? The expression inherent in the structural masses of the building, before the Orders were applied, should be sufficient.

After all, what is it we would be at? We are artists, not mechanicians. Our aim is not perfection of structure, but perfection of expression. We may need one to obtain the other, but if we strive for perfection of structure it is not for its own sake, but simply as a means to perfection of expression.

I am well aware that in recognising the application of the Orders as an added decoration not structurally required, I have laid myself open to the charge of holding the now discredited theory that building and architecture are separate things—the architecture is the decoration you apply to a building, or, as I have lately seen it expressed, construction plus decoration equals architecture.

If I repudiate the suggestion now it is not so much from the desire to forestall criticism as to direct the discussion to more profitable issues.

"Old, Unhappy, Far-off Heresy."

But, after all, there is something in this point of view—there generally is in every point of view—even, I trust, in mine. To me, this old, unhappy, far-off heresy, which is treated to-day with so much contempt by our superior persons, was but a superficial way of expressing a partially comprehended truth.

The artistic expression that is inherent in the lay-out and grouping of the structure not being recognised or understood, it was natural that the whole of the ex-

pression in the finished building should be thought to be entirely due to the shaping or decorating of the structure which takes place when we proceed to intensify and complete an otherwise imperfect expression. The Orders which we may happen to use for this purpose are not in themselves the architecture. They do not create the artistic effect; they only serve to perfect it; and in so doing they seem to me to fulfil a function.

CORRESPONDENCE.

Responsibility for Dry Rot.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Your very valuable article on the above subject in your issue of February 22nd suggests the necessity of some joint action between architects and builders, with the object of arriving at some definite understanding as to what should constitute reasonable responsibility on the part of either architect or builder for the outbreak of dry rot. I am of opinion that "dry rot," like consumption, is largely a preventable disease, and that where proper health conditions exist, pine timbers will last hundreds of years.

The suggestion in your article of the possibility of dry rot being held as a good reason for the architect withholding his final certificate is enough to send a cold shiver down the back of every builder in the country. Builders already suffer enough from the endless amount of reasons adduced for delay in making the last payment. I have in my mind a case of recent occurrence where a house has been occupied more than two years, and over £450 is still owing, the owner urging as a reason for non-payment that the w.c. cistern sometimes overflowed, and the slopstone wastepipe leaked. This sort of complaint, however, can soon be put right. But if "possible dry rot" is going to be brought into the category of excuses for delay in final payment, that, surely will be the straw that breaks the camel's back. Although it would perhaps be injudicious to contradict your statement that "all that is humanly possible may be done to prevent dry rot, and yet it may occur," I know of no instance in which it has occurred where proper precautions have been taken to prevent it. I mean, of course, in a new building. Where, however, a new wing has been added to an old building, I have known the fungi to come through an old brick wall and attack the new floors. I have also known dry rot to occur through the leakage of water-pipes; but these are accidents, and cannot generally be held as arising from the fault of anyone. Usually preventive measures are a question of £ s. d., and frequently risk is run to save the building owner the cost of these.

To start the disease of dry rot, two things are necessary, "the seed" and "the soil," in other words, the germs of fungoid life, and the conditions under which the germs can grow and propagate. The germ is subtle and often difficult to discern, but the conditions under which the germs can breed and thrive are fairly well known. To keep up the medical metaphor, the disease will spread under septic conditions, but will die under antiseptic conditions. Hence the necessity of getting to know from some accepted and reliable authority the antiseptic conditions under which healthy timber can be considered reasonably safe and immune from the attack of dry rot.

Another very important matter raised in your article is the responsibility of the

clerk of works, so far as he represents (which to a certain extent at least he always does) the architect and the owner. He may or may not possess personal authority to give orders on his own initiative; but, unless there are specific instructions to the contrary, builders generally look upon the clerk of works as the mouthpiece of the architect and owner.

Should a builder refuse to take orders from a clerk of works unless these are confirmed in writing by the architect? This refusal would very often lead to much friction, and would tend to make things uncomfortable for the builder during the whole progress of the work; more especially should the clerk of works be a man of strong will and one who magnifies his office. It is really necessary for the security of the architect as well as the builder that in all building contracts the scope and limitation of a clerk of works' duties should be clearly defined, and should he overstep his authority as a servant of the owner, his employer should be just as responsible for him as other employers are responsible for the actions of their servants. As a rule, there is generally no definite understanding as to how much authority the architect or owner delegates to his clerk of works, and unless that is fully known to the builder, his position is to a great extent an untenable one—not knowing when to take or refuse his orders, and not knowing how far he is being inveigled unto unknown responsibility. **GEORGE MACFARLANE.**

Stresses in Angle Cleat Rivets.

SIR,—Having frequently endeavoured to solve the stresses in riveted connections, I find Mr. Andrews's method (p. 123, February 1st) interesting, but by no means convincing. Why does he choose the centre of gravity of the rivets as the point about which the cleat tends to revolve?

In his Fig. 1, p. 123, the force W_3 should, I think, be an upward force, rotating in the direction opposite to the force P ; this makes the resultant R_3 almost zero. The position of this rivet could be slightly altered so that the resultant becomes zero. Being zero, the rivet may be omitted. Omit the rivet, and the centre of gravity of the remaining rivets is moved, considerably altering their stresses. According to Mr. Andrews's theory, the moving of the position of a rivet altering its stress from say .002 of a ton to .001 ton has practically no effect on the other rivets, but if its stress be altered from .001 ton to .000 the remaining rivets suddenly have great alterations in the direction and magnitude of their stresses.

I think Mr. Gillett (p. 193, February 22nd) is correct about the single rivet connection. The bolts are on the supporting girder, and the rivet is on the supported beam, and the tendency to permit "turning" is an advantage, as it offers no resistance to the beam taking its natural deflection. Plurality of rivets introduces moments which are difficult to determine, and which are due to the tendency of the supported beam to deflect, as well as the force P .

D. W. R.

[D.W.R. wishes to know why the centre of the gravity of the rivets is taken as the point about which the cleat tends to revolve in my article on "Stress in Angle-cleat Rivets." The reason is the same as for taking the neutral axis through the centroid in ordinary beams; it follows from the assumptions involved. I did not suggest in the article that the method was invented by myself; the general method is quite old, and will be found in a large number of American books on structural design under the name "Secondary

Stresses." D.W.R. says that he thinks Mr. Gillett right about the single rivet connection; so he is as far as he goes. One large rivet would do theoretically, and would be the best connection, but practice condemns it. I am sorry that, as D.W.R. suggests, there is a draughtsman's error in Fig. 1 of my article. W_3 should be upward, or else F_3 downward.—**EWART S. ANDREWS.**]

Lighting for Small Country Houses.

SIR,—I was much interested in your article appearing in this week's issue on "Lighting for Small Country Houses," by Clyde Young, F.R.I.B.A., but I find that your contributor's data on acetylene are not quite correct, and I should like to trespass on your space to point out what I consider a discrepancy.

Mr. Young states that "acetylene costs 11d. per 1,000 c.p. hours." How he arrives at this I do not know. For instance, calcium carbide at present works out at a cost of 1½d. per lb., or 14s. per cwt. delivered. The British Acetylene Association stipulates in its regulations that carbide sold commercially must yield a minimum of 4.8 cubic feet per lb., and 1.50 c.p. burner consumes approximately 1 ft. per hour. Therefore, if 50 c.p. consumes 1 ft. per hour, 1,000 c.p. will consume 20 ft. or about 4½ lbs. of carbide, which equals 6½d. per 1,000 c.p. hours.

Also with regard to piping, Mr. Young states that piping of small dimensions can be used for both air gas and acetylene, but on enquiry he will find that air gas takes much larger piping than acetylene.

Beckenham. **GEO. H. BENNETT**

[I do not doubt your correspondent's statement that acetylene gas can be produced at 6½d. per 1,000 c.p. hours. The installation of which I have personal experience, however, works out to within a fraction of the figure given. Since reading his letter I have turned up some makers' catalogues, but have not found any quotation as low as the one he gives; probably he has not taken into consideration 4 or 5 miles' cartage, which is frequent for the country. With reference to his remarks on piping I cannot agree with him that large pipes are necessary for air gas. As a matter of fact some systems of petrol gas lighting use 3 to 5 mm. pipes.—**CLYDE YOUNG.**]

THE PRESERVATION OF ANCIENT BUILDINGS.

On March 1st, at the Manchester Society of Architects, Mr. W. A. Forsyth, F.R.I.B.A., read a paper entitled "Notes on the Preservation of Ancient Buildings." The lecturer opened by remarking that the preservation and restoration of old buildings is an important subject for the attention of architects. When the opportunity occurs, architects may not always be ready or skilled in the treatment of the problem. Conservative methods are at all times necessary; imported material is always unhappy, and native material invariably satisfying.

The principles that should be observed in the renovation of an average village church or manor house were detailed. Restoration should have enduring qualities. All works should be given ample time in execution. Accurate drawings of the building should be made, showing all the irregularities; and he advocated the use of freehand drawings. A ruled plan cannot be accurate. The specification should be complete in every detail, and photographic records are valuable. Tenders should be avoided. He knew of no more satisfactory method than a 10 per cent. profit arrangement.

Coming to the actual operations, Mr. Forsyth dealt in turn with each part of the work. Rubble walls, he said, are largely misunderstood to-day. It is usual to point them, but as a rule no pointing is required, except in the dire extremity of the solid materials having become loose. The difficulty of making either plastering or pointing adhere to rubble is not realised. There are three distinct schools in the preservation of stonework to-day. The first might be called the "Limewashers." There is strong sentiment amongst them, against attempting to repair in the actual form and material of the original; if a stone mullion is crumbling, it is repaired with brick or tiles, and the place smeared over with mortar. They are anxious that their patching should reveal itself for all time. To a certain extent this school is justified by the glaring results of the second, the "Replacers," whose entire creed is to "cut out and replace with new to match." The third school is that of the "Fakers," whose delight is to deceive, and to remove all evidence of renovation. It is difficult to say which process is the most desirable. Mr. Forsyth proceeded to give instances of each method. At Westminster, a great work of "Limewashing" is being carried out, the decay of the stone being arrested by the application of limewash; some colouring is utilised to assimilate the applied material to its environment.

The use of the same methods of construction as obtained in the original building was advocated, such as the cutting of the mouldings on groin ribs in situ. After dealing exhaustively with the use of wrought-iron tie-rods, Mr. Forsyth spoke of the treatment of roofs. Machine-made tiles should be entirely excluded. English oak, he said, is the only timber. In repairing old roofs, all work should be done in position, to avoid the taking down of old rafters, tie-beams, and purlins. Old seasoned material should always be employed. **J.T.H.**

HYDRAULIC DERRICK CRANE FOR CONTRACTORS.

The hydraulic derrick here shown has been constructed to raise loads of 25 cwt. or three tons (with proportionate consumption of pressure water) through a height of 120 ft., to luff in or out between 50 ft. maximum and 16 ft. minimum rakes, and to slew through about three-quarters of a circle. The working pressure is 700 lbs. per square inch.

The lifting and luffing cylinders are placed vertically in the structure immediately below the crane mast, and the slewing cylinders are placed horizontally at the foot of the mast, the chains coiling in opposite directions around a drum secured to the mast pivot casting.

The lifting, luffing, and slewing cylinders are of the multiplying sheave type, the lifting cylinders having a multiplying power of 6 to 1, and the luffing and slewing cylinders a multiplying power of 2 to 1.

The pressure water consumed is about 100 gallons per operation, lifting the full load of three tons through the full height of 120 ft.; 26 gallons for luffing in through the whole range, and 3½ gallons to slew through three-quarters of a revolution.

The controlling valves are placed in a convenient position on the platform near the foot of the mast, and each is operated by a separate lever, so that the three controlling valves are independent of each other, and the motions can be made separately or together, as required. The makers are the Hydraulic Engineering Company, Chester.

LONDON MASTER-BUILDERS' ASSOCIATION.

Annual General Meeting.

The annual general meeting of the above association was held in the Council Chamber at Koh-i-Noor House, Kingsway, on Monday, February 27th, the President, Mr. L. Horner, occupying the chair,

The minutes of the last general meeting having been read and confirmed, the annual report of the Council was received and adopted.

The accounts and balance sheet for the year ending December 31st, 1910, were received and adopted.

The following officers were elected for the ensuing year:—President, Mr. G. Bird Godson; Senior Vice President, Mr. James S. Holliday; Junior Vice President, Mr. Walter Lawrence; Junior Treasurer, Mr. W. F. Wallis, J.P. The following gentlemen were elected to serve on the Council:—Messrs. W. Downs, T. Hall, J. W. Jerram, E. D. Pratt, H. Smith, F. Thorne and F. J. Walton. Mr. C. F. Kearley was elected Hon Auditor.

The President, having acknowledged the honour conferred upon him, proposed a hearty vote of thanks to Mr. Leonard H. Horner, the retiring President, for the admirable manner in which he had conducted

the business of the Association during the past year.

An interesting discussion took place respecting a universal week's holiday for the trade. The President opened the discussion, remarking that, though he admitted that no hard-and-fast rule could be laid down, as some firms might have urgent work in hand which it would be impossible to leave dormant for a whole week, it was undeniable that business in a builder's office was more or less disorganised through the summer months by one or more members of the staff being away for holidays. Whether it was the chief clerk or the office boy, each added his proportion to the disorganisation. His suggestion for remedying this dislocation of business was to close all works for the first week in August. The majority of works in progress are already closed from mid-day on the Saturday before the Bank Holiday until the following Thursday morning, leaving a total number of only 23 hours to be subsequently worked to complete the week. By closing down for the whole six days, opportunity would be given for half the staff to take their vacation during the last week in July and the first week in August, the other half commencing on the Saturday before Bank Holiday. By this means, where a fortnight's holiday is the rule, the whole of the holidays are

got rid of in three weeks. It was further contended that if this system were adopted it would be greatly welcomed by the merchants, possibly by architects and surveyors, and it would also give an opportunity for the outside staff to obtain a week's rest, which, under the present system, they do not get. The matter having been discussed, it was referred for the Council to deal with.

CUTTING STEELWORK WITH THE OXY-ACETYLENE FLAME.

In the course of the alterations which have been carried out for the Institution of Electrical Engineers in their new home on the Embankment, under the direction of Messrs. H. Percy Adams and Charles Holden, architects, it was found necessary to cut through a girder 6 ft. deep, which operation was accomplished with the oxy-acetylene blow-pipe in two hours. This is stated to be the first application of the process to work of this kind in London. The method, however, is not new in America. A case in point is the Gillender building in New York, where twelve built-up steel stanchions were cut off and other similar work done by an oxy-acetylene flame. The average speed of cutting with this flame is one 24 by $\frac{1}{2}$ -in. plate in one minute, but on heavy solid steel a speed as great as a 4 $\frac{1}{2}$ by 4 $\frac{1}{2}$ -in. section in one minute has been attained. The gas mixture, proportioned 1.28 oxygen to 1 acetylene, is delivered through the nozzle of a special torch, and makes a very slender flame developing 6,300 degrees of heat. The aperture in the nozzle varies with the thickness of the metal to be cut: for the work at the Gillender building it was about 1-64 in. diameter. The flame is applied to the cutting line and when its temperature is raised to a cherry red a pure oxygen jet is applied at the same point through an auxiliary independent nozzle, rapidly oxidising the metal, making a smooth deep cut about $\frac{1}{8}$ -in. wide. The torches are made of brass pipes, and fittings are very light and convenient. They are fitted with five sizes of nozzles provided for a considerable variety of work and enabling very complicated cuts to be made.

GLASGOW INSTITUTE OF ARCHITECTS.

At the annual meeting of this Institute, held on Wednesday last, the 43rd annual report was presented, in moving the adoption of which the president referred to several matters of general interest. Speaking of architectural education, and the old regime of regular apprenticeship, he said the problem before them was to associate office requirements with the advantages of a more academic training. He himself was a strong believer in the usefulness of the regular office routine of apprenticeship, and was somewhat sceptical as to the advantage of testing youths in the design of a palace before they even knew the common width of a door or the height of a stair step, but he was also fully aware that much could be done, and should be done, to improve on the existing system.

On the subject of competitions the president said there had been a wide range of selection during the year, from such as the Usher Hall and Queen's College, with excellently arranged conditions, down to the other end of the scale—or rather, beyond any scale at all—such as New Cumnock Church. To secure a better state of things, however, it was necessary for the improvement to come from architects them-

HYDRAULIC DERRICK CRANE.

selves rather than by bringing pressure to bear on competition promoters, for so long as there were architects who offered designs under the most unreasonable conditions, so long would committees and other unknowing people take the profession at its own estimate.

CENTRAL RECRUITING DEPOT.

The Architectural Association third spring visit to the Central London Recruiting Depot and Stables, Great Scotland Yard, took place on Saturday last. The buildings have been erected to replace St. George's Barracks and Stables, belonging to a private owner, both of which are shortly to be pulled down to allow for extension and fire protection in connection with the National Gallery.

In constructing the building, concrete piers have been sunk to a distance of about 20 ft. below the level of Great Scotland Yard. The design is of Georgian character, quiet and dignified. The colour of the exterior is particularly pleasing, purple grey Crowborough stocks being used for the facings, a salt glazed brick plinth, gauged red brick arches, aprons and quoins, and Portland stone cornice key-stones, etc. The ground floor windows have bold Portland stone architraves. Westmorland green slates are used for the roof; window sashes are painted white, doors green.

The plan of the Depot is a square, with a centre court from the ground floor upwards. The court on the ground floor, used for assembling recruits, is covered with a roof of wired glass. The building is of fire-resisting construction, floors formed of steel joists encased in breeze concrete. The interior is of the simplest character, glazed brickwork being used to a great extent for wall faces. Skirtings for the greater portion of the building are dispensed with. Cubicle and dressing-room floors are covered with "Eubœolith," on account of its non-conductive properties, laid direct on to concrete without a screeded face. Maple blocks are used for most other floors throughout the building.

The building is heated by radiators supplemented by coal fires. The radiators are fixed to brackets in wall, keeping them off floor for sweeping purposes. In the basement 10 bath cubicles are provided for recruits; water is turned on with a key from corridor outside, thus checking the supply. Barber's shop, great-coat store, disinfecting chamber, boiler house, and lavatories occupy the portion of basement used by Recruiting Depot. Accommodation is also provided for a reserve force of the Metropolitan Police, and a large store is set apart for the use of H.M. Office of Works.

On the ground floor on the right and left of the main entrance are the recreation and coffee rooms, in front the court having kitchen on the left. The kitchen walls are of glazed bricks. A Warren Army pattern cooker takes up very little space, but cooks for 145 men. A large scullery adjoins, with larder and store.

On the right of the court is the guard room, with prisoners' cell, and across the court, with a frontage to Craigs Court, are the inspection room, preliminary examination room with dressing boxes, and dentist's room.

On the first floor are the attestation room, sergeants' mess, and cubicles for recruits. Second floor, commanding officer and staff, and more cubicles.

On the third floor are the quarters of the sergeant-major, pay clerk, staff-sergeant, and canteen-sergeant. The quarters comprise

four separate flats, that of the sergeant-major being slightly better than the others. The flats have kitchen, scullery and offices, living room and two bedrooms—three in the sergeant-major's.

The rooms are well lighted and of good size, looking out on a balcony running round a central court. Cubicles are provided on the remainder of this floor and fourth floor. The flat portions of roof are formed of concrete covered with asphalt. A rifle range will probably be provided on the roofs.

The stables adjoining are built of similar material, and have been designed to harmonise with the Recruiting Depot. Owing to the limitations of the site, horses are accommodated on the first floor, which is reached by a sloping way 7 feet wide leading on to a rubber paved gallery. Seven stalls and 14 loose boxes are provided; stable floors are paved with adamantine paving clinkers. Caretakers' quarters, mess room, kitchen for grooms and head coachman's quarters occupy the second floor, and on the third floor are the cubicles for grooms, bathrooms, lavatory, cleaning rooms, and head groom's bedroom.

The ground-floor accommodation comprises coach-house, harness and steel rooms, loose box, and covered washing space. The fittings are of the most modern type.

The architect is Sir Henry Tanner, and the builder Mr. J. Dorey.

The party was conducted by Mr. D. N. Dyke, A.R.I.B.A., of H.M. Office of Works, who has had charge of the building.

A NOTTINGHAM IMPROVEMENT SCHEME.

The plan reproduced below shows the alterations which are now being carried out in Carrington Street and Grey Friar Gate, Nottingham—alterations that have been under discussion for some years. When they are completed the city will be in possession of two fairly broad streets instead of two narrow and inconvenient ones. Carrington Street is one of the busiest thoroughfares in Nottingham, being the approach to the Midland Railway Station, as well as to the large district in the south, including West Bridgford, and to Trent Bridge. It has been inconveniently crowded for years past, and several serious accidents have occurred in consequence. The cost of

the scheme will be at least £37,000. Not only will the two streets be widened, but some very poor property will be cleared away and replaced by buildings of a better character, so that the ratable value of the city will be increased; while its appearance will be much improved. Carrington Street will be made 70 ft. wide instead of 50 ft., as at present, and Grey Friar Gate will be widened from 35 ft. to 60 ft. On the accompanying plan the additional areas to be included are shown dotted.

THE LATE MR. FREDERICK SHIELDS.

We regret to record the death, in his 77th year, of Mr. Frederick Shields, who was an Associate of the Royal Water-colour Society, but was known rather as a decorative artist than as a water-colourist, and had the good fortune to carry out, at the chapel built by Mrs. Russell Gurney at Hyde Park Place, the largest piece of interior wall decoration that has been executed in London since Barry, in the eighteenth century, painted the walls of the meeting-room of the Society of Arts in the Adelphi. The erection of this chapel, with its quiet Romanesque façade standing back a little from the Bayswater Road, and contrasting so strongly with the noise and traffic of the road, was a beautiful idea; and the commission to an artist to paint the interior with sacred pictures, which should speak to the souls of those who sought repose within the building, was an undertaking with which one must feel a sincere sympathy. The task was a great one, on which Shields seems to have spared no pains; indeed, the mere extent of wall-space covered is remarkable as the work of one man. One can hardly say, it is true, that the work is of the first importance from an artistic point of view; Shields was not a Puvion de Chavannes; but it is sincere work done with a sincere aim, and will appeal to many to whom the representation of sacred scenes, and their symbolical significance is of more interest than questions of colour or of decorative style. One can only wish that such an experiment were oftener undertaken in London.

OUR PLATE.

The photograph reproduced as a centre plate in this issue shows the north pavilion forming a section of the completed scheme approved by the Office of Woods for the rebuilding of the portion of Regent Street between New Burlington Street and Conduit Street. The architect is Mr. Frank T. Verity, F.R.I.B.A., and the contractors are Messrs. Allen and Co., of Westminster. The carving work has been carried out by Messrs. E. J. and A. T. Bradford, and the cast-iron window frames by Messrs. Walter Macfarlane and Co., of Glasgow.

A New F.S.A.

Mr. Sydney D. Kitson, M.A., F.R.I.B.A., of Leeds, has been elected a Fellow of the Society of Antiquaries.

Memorial to G. F. Watts.

In the cemetery at the village of Comp-ton, in Surrey, Mrs. G. F. Watts, widow of the famous Royal Academician, unveiled last week a memorial to her husband. It takes the form of a cloister 9 ft. long by 7 ft. wide, carried out with interlacing arches of brickwork. In the centre is a recumbent figure of Mr. Watts, the work of Mr. Thomas Wren, of Comp-ton.

IN PARLIAMENT.

(By our own Gallery Representative)

Mineral Rights Duty.

Mr. Hobhouse has informed Mr. Younger that mineral rights duty is charged upon royalties received in respect of granite and whinstone, but not upon royalties received in respect of freestone. As to the grounds of distinction, freestone falls within the exemption conferred by Section 20 (5) of the Finance Act, 1910, while granite and whinstone do not.

Amendment of Housing and Town Planning Act.

Mr. William Bull asked the President of the Local Government Board whether he would state how many local authorities had now represented to the Board the expediency of amending the Housing and Town Planning Act 1909 by substituting a judicial tribunal under the Act, and whether certain bodies had expressed their dissatisfaction with the appeal procedure of the Board.

Mr. John Burns, in a printed answer, stated:—"Representations to the effect mentioned have been received by the Local Government Board from 32 local authorities out of over 1,800 such authorities in England and Wales. I am aware that the 32 local authorities referred to include the nine Metropolitan borough councils named and also the borough council of Greenwich, and that the Camberwell Borough Council have also expressed some dissatisfaction in regard to the method of procedure adopted in connection with appeals to the Board under the Act of 1909. Out of the 32 local authorities who have made representations, not one has had any experience of the Board's inquiries into appeals under the Act of 1909, nor do I find that these authorities have any special claim to be heard in this matter, based on action taken by them under the Housing Acts. According to the returns furnished to the Board, under Section 44 of the Housing of the Working Classes Act, 1890, for the years ended 31st March, 1909, and 31st March, 1910, no closing orders were made by the 10 metropolitan borough councils mentioned in either of those years, and only three of that number report any action under Part II. of the Act of 1890 in the same years. Of the 22 provincial authorities included, eight authorities report no action in either of those years under that Part of the Act of 1890, and only four of the same 22 authorities made, or obtained from the justices, any closing orders during those years."

COAST EROSION.

At an ordinary meeting of the Society of Engineers, the paper read was "Coast-Erosion," by W. T. Douglass, M.Inst.C.E.

It was pointed out that the coasts subject to erosion are mainly those consisting of friable cliffs, and low-lying lands. Where the coast-line is constituted of hard rock the problems connected with erosion do not occur. The erodible shore is to be found, therefore, on the east and south coasts of England, principally between Berwick and the Start Point.

The means for effective coast-protection are sea-walls and groynes, not separately but in combination, though a natural storm-beach is the ideal bulwark. A wall as the sole defence of a friable cliff is invariably undermined. Groynes are effective in proportion to their length. Their spacing must depend on circumstances, but the main consideration which should

govern decision as to the distance apart at which groynes are built is the obliquity of the prevailing impinging wave on the foreshore. Groynes require a sea-wall as an adjunct, since, without it, material accreted by them is liable to be carried around the shoreward ends by an abnormal high tide, when accompanied by a storm of great violence. The total quantity of beach-material travelling on the foreshores is not sufficient for the defence of all of them.

THE LIVERPOOL MEMORIAL TO
KING EDWARD.

The discussion over the above memorial still continues. A petition is being presented to the Lord Mayor and Corporation urging that St. George's Hall, "which in its present condition is recognised as a complete and perfect example of its type of architecture," should not have its main lines in any way altered, by the introduction of steps or otherwise, in order to provide a site for the memorial to the late King.

Professor Reilly, in view of the rumour that the Finance and Memorial Committees intend to persist in their proposal, restates below the points which have most clearly emerged from the controversy:—

1. The podium wall as it stands was erected after the deaths of both Elmes and Cockerell.

2. It was built after a number of schemes and experiments for providing a mode of access from St. John's Lane to the south front had been suggested. One of these schemes was actually carried out, but discarded by Cockerell in 1860, three years before his death. A drawing for the podium as it now exists was made by him in that year, and is practically identical with Elmes's first intention.

3. It is not known who actually constructed the present podium wall—prob-

ably the city surveyor at the time—but the important point is that in doing so he carried out what was to all intents and purposes Elmes's first arrangement and Cockerell's drawing of 1860.

4. Elmes designed the podium as an unbroken wall for two reasons—first, because a great flight of steps was rendered impossible by the nature of the site; second, the position of the Criminal Court immediately behind the south door made the use of the latter as a main entrance impossible. In these circumstances, the effect aimed at was one of remoteness, similar to that achieved by the placing of the Parthenon on the sheer cliff of the Acropolis.

Since the south elevation as we now see it represents Elmes's first inspiration, and as all attempts to overcome the difficulty of providing a south approach have proved aesthetically unsatisfactory, can we now reasonably venture to engage in similar experiments with the certainty of failure before us?

DESIGN FOR A TALL CHIMNEY
SHAFT.

The accompanying drawings were awarded the second prize in a competition for a chimney shaft 120 ft. high, held at the Municipal School of Art, Leicester, some time ago. The design, which is by Mr. A. R. Widdowson, A.R.I.B.A., represents an attempt at the more architectural treatment of the tall chimney without in any way sacrificing anything of its essentially utilitarian character. The circular plan has wisely been adopted as affording the most practical solution of the constructional difficulty of resistance to wind pressure. The drawings, being self-explanatory, call for no detailed description. The smaller drawing illustrates the bonding of the brickwork courses.

DESIGN FOR A CHIMNEY SHAFT 120 FT. HIGH: DIAGRAM SHOWING BONDING OF BRICKWORK COURSES.

COST OF SCHOOL BUILDINGS.

DEPARTMENTAL COMMITTEE'S REPORT.

As a considerable stimulus to school-building is likely to ensue on the report of the Departmental Committee, the following extracts from that report should possess much practical value and interest.

IN February, 1910, a Committee was appointed by the President of the Board of Education to enquire "(a) Whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability, be reduced by the use of materials or methods of construction different from those ordinarily employed at present; and, if so (b) what steps should be taken to facilitate the adoption of such materials or methods and whether any alteration in the law is required for the purpose." The Committee was constituted as follows:—Mr. L. A. Selby-Bigge, C.B., Principal Assistant Secretary of the Elementary Education Branch of the Board of Education (chairman); Mr. N. T. Kershaw, C.B., Assistant Secretary of the Local Government Board; Mr. F. Clay, Architect of the Board of Education. Mr. J. G. Milne, Senior Examiner of the Board of Education, acted as secretary. The report was issued on February 22nd, and a résumé of its recommendations was given at p. 225 of last week's Journal.

The Committee held sixteen meetings and examined thirty witnesses. They also visited buildings at Anerley, Ipswich, Bordon Camp, Harrow, Borstal, and Windsor, to investigate novel methods of construction. They communicated with the councils of the R.I.B.A., the Royal Sanitary Institute, the Land Agents' Society, the Surveyors' Institution, the Quantity Surveyors' Association, the Institute of Civil Engineers, the Association of Municipal Corporations, and the County Councils Association; and also with the War Office, Admiralty, and Home Office. Enquiries were addressed to 141 Education Committees, of whom fifty-five had the grace to reply.

The "Useful Life" of School Buildings.

The problem involved in the enquiry is thus stated:—

So far as the cost of school buildings depends on their solidity of construction and the standard of durability which the architect adopts, it is proper in the first place to consider what is the expectation of "useful life" for which an architect should allow in designing them, and how far it is possible to make their "structural" coincide with their "useful" life. It is, of course, obvious that the standards of ventilation, lighting, heating, sanitation, and general comfort have risen very greatly during the last 25 years. It is also well understood by all experts that methods of instruction, classification, and staffing have undergone a process of development which amounts to little less than a revolution, and that, generally speaking, the way in which the buildings of a good school are used, and the purposes which they serve, are altogether different from those which were in vogue not many years ago. Comparatively modern buildings have thus become old-fashioned, and it is a matter of common remark, and indeed of complaint, that buildings erected not long ago, which are still quite sound structurally, have to be extensively altered or completely remodelled, in order to adapt them to the organisation of an up-to-date school. Although it may be expected that the changes in school organisation and in the standard of school hygiene and comfort

will not be so extensive and rapid in the future as in the past, it would be rash to suppose that the process of hygienic and educational development has nearly reached its limit, or that this process will not continue to modify the planning of school buildings. In designing school buildings, therefore, the architect cannot afford to overlook the possibility of their being remodelled or even abandoned at some future date which will involve some waste or sterilisation of capital expenditure. He will therefore plan his buildings on the simplest possible lines, so as to facilitate alteration of the internal arrangements. He will also recognise that the degree of durability and immunity from repairs at which he may legitimately aim is limited, that it is not good practice either from an educational or from an economical point of view to make school buildings as solid or durable as warehouses or churches, and that so long as his building will be warm, weather proof, and inexpensive to maintain during the period of its useful life, he is at liberty to make some sacrifice of durability to saving in first cost.

In localities where, owing to the nature of the ground, it is practically impossible to secure a stable foundation, or where (e.g., by the extension of mining operations) the support of the buildings may be withdrawn, it is essential not only to reduce the weight of the building to a minimum and to modify its construction, but also to avoid any unnecessary expense in erecting it, since it may be rendered uninhabitable at a comparatively early date.

Where, moreover, the population is of a shifting or exceptional character, and it is uncertain whether any school or so large a school will be required in the locality after a limited period of, say, 15 or 20 years, something between a permanent and a temporary building is wanted. The demand for such a building arises not only in mining and other industrial districts, but also in towns where the working class population is gradually moving out to the suburbs, but where, pending the completion of the process, there is urgent need for new school buildings in the older and central districts. The ingenuity of school architects may well be directed to find a satisfactory type of semi-permanent school building which shall be cheap to erect, inexpensive to maintain, cool in summer, and warm and dry in winter. There is reason to believe that there are a good many cases in which it would be prudent for the Local Education Authority to propose and legitimate for the Board of Education to approve the erection of such buildings in which durability is treated as a matter of secondary importance.

The purely temporary school building is almost invariably, from an educational point of view, much superior to any permanent building designed for other purposes which is pressed into the service of education. It is, however, at best an expensive and unsatisfactory device, only justifiable in cases of emergency or to meet a sudden growth of population, and the scope for the use of it appears to be diminishing as Local Education Authorities catch up with the arrears of school supply which confronted them after 1902.

In this Report, therefore, the suitability of various methods and materials submitted was considered from the point of view of the "useful life" which may be assigned to permanent or semi-permanent school buildings.

Circumstances Affecting the Cost of Elementary School Buildings.

It is generally admitted that there has been a very material increase in the cost of erection of school buildings in recent years. Evidence on this point was submitted by architects who have been continuously engaged in the work of planning schools, in some cases for nearly 40 years; and it would appear that while in the period immediately following the Elementary Education Act of 1870 it was found to be possible to provide schools in most localities at a cost of £5 or £6 per place, the cost of a modern permanent school erected under favourable circumstances according to ordinary modern practice cannot be put much under £10, and a reasonable estimate for an ordinary building designed with due regard to economy would range from that figure up to £13 10s. per head, according to the provision made for halls and instruction in domestic subjects and manual work.

This increase of cost is due, to a very large extent, to conditions which are not under the direct control of the Local Education Authorities. Reference has been made to the rise in standards of comfort and hygiene, and the development of educational methods, on which the Board of Education in their report for the year 1908-9 have laid considerable stress. A few of the ways in which this advance has most obviously involved greater expenditure are instanced. In 1870 it was regarded as sufficient if 8 square feet of floor space was provided for each child; the minimum requirement now is 10 square feet for children over about 8 years of age and 9 square feet for those under that age, while in the latter case a further provision of free space for exercises has to be made: so that the mere superficial area to be covered has been increased by practically a quarter. The earlier type of school building, which survived in some places, with or without modification, for some time after 1870, was virtually a single room, where all teachers (the average of whose qualifications was low) and classes could be under the eye of the head teacher at the same time: it is now regarded as a matter of the first importance that every class should be taught in effective separation from its neighbours, and consequently the interior of the school must be subdivided into classrooms, and the position of a classroom for every class has become the rule in all new schools. Since the introduction of the classroom system, there has been a progressive movement in favour of a reduction in the size of classes, which involves still further subdivision of the building and multiplication of the areas of floor space not occupied by desks but required for the teacher, the blackboard, etc. At the same time, while classes have been segregated into separate rooms for teaching purposes, it has been found highly desirable to have a large room where all the scholars or several combined classes may be assembled; and so, when the single schoolroom disappeared in favour of class-rooms, additional provision had to be made in the shape of a "hall," the need for which has been more and more felt as the importance of physical training and exercises has been realised. Amongst more recent developments are noticed the wider recognition which is now given to the value of domestic and manual training, subjects

for which is required a certain amount of extra space and equipment beyond that sufficient for the purposes of the old elementary curriculum.

In general, local education authorities and their architects have kept well in advance of the minimum requirements of the Board of Education, and the arrangements necessary in order to meet the stricter requirements of the present standard of school hygiene have been even more readily adopted. The provision for heating, ventilation, and lighting of schools is in many cases almost double that which was regarded as sufficient thirty years ago; but every witness who has touched on these points has deprecated strongly any attempt to reduce capital expenditure by cutting down or omitting items which tend to secure more healthy conditions for the children under instruction.

A cause of increase in cost which is clearly beyond the control of the local education authorities lies in the general rise of building prices. To a large extent this increase is due to a permanent rise in the cost of labour, but in other respects the cost of building is liable to fluctuation; at the present time there are slackness and severe competition in the building trade which have materially reduced the cost of school buildings.

It must be admitted, however, that local education authorities do not all or always practise in fact those reasonable economies which are really in their own power, or exercise sufficient self-control or self-restraint in the matter of the style and general character of school buildings. It may be admitted also that the liking for florid and pretentious elevations is less prevalent, and that the general improvement of the public taste is reflected in a greater appreciation of simple, dignified, and appropriate exteriors, from which decorative "trimmings" are absent. It still, however, is the case that local patriotism sometimes confuses modesty and simplicity with meanness, and demands a school building which shall not only not clash with neighbouring buildings, but shall form a striking feature of the district or by mere costliness enhance in popular opinion the dignity of the locality; and where district committees are allowed much influence in the selection of plans their influence is not infrequently conducive to extravagance.

In other cases local authorities or their committees are influenced by the laudable desire to have the best school building which money can buy, and submit to the Board of Education plans and specifications in which no item is conspicuously extravagant, but the highest possible standard is adopted in every respect; the result being a very spacious, durable, finely finished, and completely equipped building, costing a very large sum per scholar accommodated.

The Committee say that they have received no evidence which indicates that a local education authority is justified in adopting any such sum as £20 per head of accommodation as the standard by which to estimate the cost of ordinary school buildings which do not contain a large number of special or supplementary rooms.

The cost of school buildings largely depends on the number and character of the special rooms which are provided over and above the essential minimum of classrooms, cloakrooms, offices, etc.—such as "halls," rooms for instruction in wood and metal work, domestic subjects (cooking, laundry, and housewifery), drawing and elementary science, dining-rooms (for use by children who bring their own dinners or for meals provided under the Provision

of Meals Act), bathrooms, medical inspection rooms, and school libraries. It is obvious that from an economical point of view the question whether they can, or will, be used fully and continuously or only occasionally and spasmodically is one of the first importance. For instance, if the hall is so designed that it cannot be used for singing, physical exercises, etc., without disturbing the work of the classes in the classrooms (as is the case where classrooms are grouped round and open directly out of the hall), it is less likely that full use of the hall will be made for its proper purposes than if it is isolated or "insulated." It is still more obviously wasteful to provide a hall for special purposes and subsequently to fill it with desks and use it as an overflow room for the ordinary work of classes. Where, however, the hall is made the chief architectural feature of a block of buildings and is built with high thick walls and an expensive roof, the relation between expenditure and educational value which everyone desires to preserve becomes still more distant. As regards rooms for manual and domestic instruction, there is, the Committee believe, a tendency in the case of large schools to provide them in, or in close connection with, the school buildings, but there is also a tendency (which from the financial point of view must be welcomed) to make one special room serve several special purposes and to make the ordinary rooms also serve special purposes. Generally speaking, the tendency to provide an extra room for each special branch of work is less marked than it was a few years ago, and this is particularly the case with rooms for Art and Science. The Committee note with satisfaction the ingenuity with which many school architects are contriving to get the utmost possible service out of school buildings, and taking every opportunity of providing facilities for special branches of school work or for improving the health and physical condition of school children without appreciably increasing the total cost of the buildings.

The evidence indicates that the most economical buildings, considered in relation to their efficiency for educational purposes, have been provided by architects who have made a special study of school planning, either as the official architects of local education authorities or in the course of private practice. Good results have been obtained both where the permanent staff of a local education authority have designed schools and supervised their erection, and also where the work has been entrusted to an unofficial architect. On the other hand there are cases in which the employment of a local official whose principal duties are not those of an architect has led to results just as unsatisfactory as arise from the employment of an independent architect who has made no special study of schools. The Committee fully concur in the doctrine that the work of designing school buildings is, in fact, a highly specialised branch of the architectural profession, and that real economy can only be secured by a thorough acquaintance with the actual needs of schools in practice and the constant comparison of various expedients adopted to meet these needs, both in this country and abroad. On the other hand, so far as ordinary elementary school buildings are concerned, the evidence which has been received leaves the impression that competitions are as a rule a waste of time and money. It is claimed by their supporters that they not only give new men a chance, but promote progress and the introduction of new ideas. Unfortunately experience in this respect is paradoxical. Apart from personal and

other considerations which affect the number and quality of the competitors, it seems that originality is not conducive to success in competitions, even where the conditions of the competition allow of it, and that they result in the perpetuation rather than in the improvement of well-established models. Competitions also preclude discussion between the architect and his client while the plans are in a preliminary stage (a matter of special importance in the case of schools), and also render the subsequent modification of the successful and finished plans a difficult and sometimes an embarrassing matter.

In one respect the employment of a local architectural staff, or at any rate of an architect with local knowledge, may effect substantial economy. In certain cases, the specifications for school buildings have contained directions for the use of materials which had to be brought from a distance, when equally satisfactory materials could be obtained at a cheaper rate in the immediate neighbourhood of the site. It is obvious that, especially in respect of knowledge of local materials, as well as in connection with the special customs and tastes which prevail in many parts of the country, there are considerable advantages on the side of employing the man who has had practical experience of local conditions.

Detailed examination of the items in cases where thoroughly satisfactory school buildings have been provided at a cost below the average shows that *the reduction in expenditure has been obtained, not by any remarkable devices, but by a careful attention to small savings on numerous items.*

Actual Cost of Elementary School Buildings.

Not only is there a wide divergence in the actual cost of school buildings in different parts of the country, but the cubical content per unit of accommodation also varies considerably with different plans. As the floor space and height of classrooms are practically determined by the regulations of the Board of Education, this variation arises from and represents economy or waste of space in corridors, roofs, halls, and so forth. An examination of a number of typical plans shows that, while it is possible to design schools including central halls at a rate of 400 to 450 cubic feet per head of accommodation, it is by no means uncommon to find the amount running up to 500 or even 600 cubic feet per head. A school without a hall will contain from 300 to 350 cubic feet per head, according to the width of the corridors. Probably the difference in the cubical contents of buildings per head of accommodation is one of the most important factors in the wide difference in cost; and reference to this factor affords the best check on the planning and design of the building.

It appears that, in counties where bricks are cheap, such as Staffordshire, Derbyshire, Lancashire, etc., the main building can be reckoned at 4½d. to 5d. per cubic foot, to which about 1d. would have to be added to cover the cost of playground, offices, etc. A school, therefore, economically planned and erected, in a district where building is cheap, including a hall, out-buildings, playgrounds, etc., would cost, according to ordinary practice, from £10 (at, say 6d. for 400 feet) to £11 a head.

It may be taken that a school building with a suitable and sufficient provision of hall accommodation (say, a common hall for boys and girls and a smaller one for infants), but without any special rooms, should cost from 33s. 4d. to 37s. 6d. per head for every penny per cubic foot that a building of the school type may reasonably be expected to cost in the district, in-

cluding all work to make school and playground ready for occupation; thus:

Building at	per cubic foot	at 33/4	at 37/6
		£ s. d.	£ s. d.
6d.	=	10 0 0	11 5 0
7d.	=	11 13 4	13 2 6
8d.	=	13 6 8	15 0 0

These figures assume that there is nothing in the site or locality which would entail extraordinary expenditure, and, though they allow for halls, do not allow for rooms appropriated exclusively to special instruction.

In the case of a school to accommodate very small numbers, there is naturally a much wider range of cost, since a very slight increase or saving will make a great difference in the cost per head; but, as these small schools do not usually have halls, and the walls and roof can be kept low, it will be found that under favourable circumstances they can be built for a much lower figure than that given above, cases of schools recently built for £7 a head having been brought to notice.

The cost per head may be analysed more or less roughly in the following proportions. Taking a school for 320 "mixed" and 320 infants, erected in one storey and costing £10 17s. 9d. per head, it was found that the main structure accounts for £8 19s. 7d. per head at 4½d. per foot cube; offices and drainages 14s. 10d.; asphalted playground 10s. 8d.; and boundary walls 12s. 6d. Another case of a school for 156 costing £9 8s. 4d. per head gave £6 19s. 2d. for the main building at 5d. per cubic foot, 17s. for offices, £1 1s. 6d. for boundary walls, and 10s. 8d. for asphalted.

The cost of furnishing does not vary greatly, and can generally be reckoned at something between 10s. and 12s. per head. The cost of sites is naturally of too variable a nature to allow of any figures that would be much guide, on account of the wide divergence both in the local price of land and in the size of the playground.

Appendices to the report give the actual or estimated cost of a large number of schools recently erected or in process of erection in different parts of the country.

Novel Materials and Methods.

In the course of their inquiry into the use of novel materials and methods, the Committee found some difficulty in obtaining satisfactory evidence with regard to actual experiments in construction, as hardly any school architects have used any materials other than brick or stone, except for purely temporary buildings. So far as concerns school buildings, this has been ascribed by some witnesses to the fact that local by-laws do not as a rule admit of the use of other materials. In a large part of the country, however, there are no building by-laws, and in some of the areas which have by-laws provision is made for the use of other materials. The Building Regulations of the Board of Education allow a fair amount of latitude, but, by laying down definite rules for the thickness of walls, etc., they have no doubt contributed to the absence of experiment. Some, however, of the materials and methods described below might certainly have been proposed—one or two have in fact, been proposed to and accepted by the Board—for the erection of schools.

The evidence received is not sufficient to justify the recommendation of any particular materials or system of construction for general adoption, especially as local conditions would play an important part in determining whether economy could be effected in an individual case: but it seems highly desirable that local education authorities should make careful inquiries as to the methods best adapted to meet the needs of their own districts, and, if they can find

any scheme which appears to them to provide a satisfactory and economical school building for their own purposes, should submit it to the Board of Education.

The methods which have been proposed to the Committee may be roughly classified as follows:— (i) Steel Frame Buildings: (a) with thin solid curtain walls of concrete; (b) with hollow curtain walls of concrete slabs; (c) with curtain walls of brick, hollow or solid; (d) with curtain walls of patent materials; (e) with hollow curtain walls of expanded metal faced with cement and plaster. (ii) Reinforced brickwork. (iii) Ferro-concrete buildings. (iv) Brick buildings with solid 9-inch walls. (v) Brick buildings with thin hollow walls. (vi) Timber frame buildings with slab casing. (vii) Wooden buildings.

This classification is only adopted for convenience in dealing with this subject, and it will, of course, be understood that the various methods described are capable of combination in many ways.

Of the various forms of patented blocks used for forming the curtain walls of a steel or wooden framed structure, the Committee investigated one known as "Frazzi," which has been widely used. Particulars of two hospitals erected with this material at Windsor and Benenden, were furnished by Mr. William West, the architect, and the Committee visited the first-named under the guidance of a director of the Frazzi Company. In these cases the material is used to fill in a steel-framed structure, and is rough-cast on the outside. The building appeared to be satisfactory and was well spoken of by the occupants. The open-air school at Thackley built by the Bradford Corporation, of which Mr.

Kirkby, the borough surveyor, supplied particulars, is also erected in this material, being rough-cast on the outside and left plain on the inside, the surface of the block showing. The same material has been used for churches and private houses. An equally satisfactory building for school purposes could probably be obtained by the use of other hollow blocks or by means of hollow walls of brick or concrete. It would depend on local conditions which material would prove most economical. Mr. Fisher informed the Committee that he had obtained alternative estimates for a building in reinforced brickwork and in steel with Frazzi filling, and found the former slightly cheaper in the particular case, as bricks were cheap in the locality; but he would expect the difference to be on the other side and in favour of Frazzi where bricks were not readily obtainable. The director of the Frazzi Company supplied estimates from which it appears that, for the walls of an ordinary building, he claims that his system would effect a saving of about 40 per cent. as compared with brickwork.

Another patent slab known as the "Fram" is described in an account of the Harrow Sanatorium, and there seems to be no reason why others of the numerous forms of slabs used for internal partitions should not be used for external walling, if suitably treated to render them waterproof; but, unless the slab is itself hollow, it is desirable to have a double wall in order to secure an airspace.

A proposal has been submitted to the Board of Education for the erection of a school at Nacton, in East Suffolk, on a method which has been extensively employed for cottages on Captain Pretymann's

THE MARKET CROSS, CROSCOMBE.

estate. A steel framework is constructed, strengthened by cross-wiring, and this frame is filled in with expanded metal lathing on both sides; the outer side is faced with a layer of cement and rough-cast $1\frac{1}{2}$ ins. thick, and the interior with $\frac{3}{4}$ -in. of plaster, a cavity $6\frac{1}{2}$ ins. wide being left between the two sides; the lower part of the wall is built in brick up to the plinth level, or, in the case of a school, to the under side of the window sills. Cottages designed on this system have been visited, and the result appears to be satisfactory, and there is no reason to suppose that it would be unsuitable for schools.

In regard to steel frame construction generally, whatever form of filling may be adopted, attention has already been drawn to the fact that considerable economy would be effected in the space occupied by a school building, owing to the diminished thickness of the walls; Mr. Riley estimated the saving in area at 8 per cent. A further advantage common to all forms of steel framework, is the economy in foundations rendered possible by the lighter building; and on an insecure foundation a wall contained in a steel frame is certainly safer than a plain brick wall. On the other hand, all the forms of filling proposed require to be made weather-proof by a facing of cement rough-cast or a similar material; and Mr. Jacques suggested that there are objections to the use of rough-cast in a smoky atmosphere. It is obvious also that this method of construction calls for a special treatment of the elevations.

The general conclusions of the Committee were summarised at p. 225 of last week's issue.

CROSCOMBE.

The old-world village of Croscombe lies hidden away in a narrow valley which widens out towards the western side in the direction of Wells and Glastonbury. It consists of one long rambling street, with two turnings leading off northwards, between which stands the church.

This district of Somerset is rich in domestic remains, more especially those in the fifteenth century, and specimens more or less perfect are to be found in most of the towns and outlying villages. Croscombe has numerous examples, prominent amongst them being the old village inn, a fine and well-preserved specimen, with its picturesque stone bay window and carved stone ceiling. A very interesting old stone cross stands in the middle of the village, close to the "Rose and Crown," forming a conspicuous feature with its cavalry of three steps, sur-base and tapering shaft, all octagonal on plan, the total height being about 13 ft.

The village church is built of stone quarried in the neighbourhood, and consists of nave, chancel and side aisles. It was erected either in the reign of Henry VI. or early in that of Edward IV., although the south porch, north door and chancel arch are remains of a more ancient building. The interior is altogether pleasing and beautiful. The aisles extend beyond the sides of the chancel, forming two chantry chapels, the one on the south side being the De Paulton Chapel, and that on the north the Chapel of St. George. The latter was constructed in the early part of the sixteenth century. A lofty pointed arch divides the nave and chancel, under which is a very richly carved oak screen surmounted by the Royal Arms. The pulpit, too, is a fine piece of woodwork. It bears the arms of Bishop Lake, and is of the same date as the chancel screen—1616.

NATIONAL TOWN-PLANNING CONFERENCE.

As briefly recorded in last week's journal, a national conference on details of practical town-planning administration was held on February 23rd and 24th, at St. George's Hall, Liverpool. Between 600 and 700 delegates were present, and nearly 300 local authorities were represented.

The Lord Mayor (Mr. S. Mason Hutchinson), in welcoming the delegates, said that the old days of narrow streets and congested thoroughfares were gone, and the next generation would witness magnificent strides in civic progress of this kind.

Alderman W. Thompson, who presided at the conference, acknowledged the good work that had been done in Liverpool—whose excellent local Act was in itself almost a town-planning Act—especially the steady, unselfish work in dealing with the problem of rehousing the poorest of the poor. Another reason why they were glad to be in Liverpool was because it was the pioneer city in providing a Chair at the University to deal with the

fundamental questions of town-planning: in which respect they had set an object-lesson to the country. On the purely architectural and site-planning or village-planning side, numerous experiments carried out entirely by private enterprise have, Mr. Thompson points out, already afforded useful object lessons. These schemes include: Harborne, 53 acres; Ealing Tenants, 61 acres; Leicester (Anchor Tenants), 61 acres; Hull, 90 acres; Earswick Village, 120 acres; Woodlands Village, 127 acres; Wavertree Garden Suburb, 185 acres; Hampstead Garden Suburb, 240 acres; Glyn Cory (Cardiff) Village, 300 acres; Port Sunlight, 350 acres; Falling's Park, 450 acres; Gidea Park, Romford, 500 acres; West Hyde, Herts, 500 acres; Bournville Village, 525 acres; and Knebworth Village, 1,000 acres. There is also the remarkable Garden City experiment, on 3,818 acres, at Letchworth. With respect to municipal schemes, the town planning scheme at Ruislip-Northwood seems to cover all the ground, so far as anything practical has been done under the Housing and Town Planning Act at present. It discloses a general municipal plan for about 6,000

ELIZABETHAN HOUSE, CROSCOMBE.

acres, and a detailed owner's plan for 1,300 acres in the very centre of the area of the local authority, thus constituting by far the largest scheme so far attempted under the Act. King's College, Cambridge, the owner of the Ruislip Manor Estate of 1,300 acres, have entrusted the development of this estate to Ruislip Manor, Limited, a company which has been formed for this purpose. The Birmingham City Council has scheduled 2,320 acres of land, chiefly agricultural, belonging to forty different owners, in the parishes of Quinton (838 acres), Harborne (1,301 acres), Edgbaston (134 acres), and Northfield (47 acres), all within the city boundaries and having a population of 7,691 and a rateable value of £29,762. A second area has been scheduled at East Birmingham, comprising 1,477 acres, and in connection with this it is proposed to purchase a farm containing 82 acres, at the price of about £11,000, for various public uses, among which allotments, new roads, a school site, and playing fields have been suggested. In Scotland a garden city to be dedicated to golf is contemplated at Barassie, near Troon. The Dundee City Council has in contemplation schemes to preserve the amenity of the residential parts of the city. Edinburgh is moving with regard to certain city lands, but finds high prices a difficulty. Both Greenock and Gourock are considering schemes in view of the large influx of English workmen transferred by the Admiralty from Woolwich. The great Dunfermline Rosyth scheme has got to the stage of the local authority promoting a provisional order to extend the boundaries of the Royal Burgh right down to the Firth of Forth, so as to include the Admiralty's estate at Rosyth. A scheme which promises to be the most important piece of town planning in the country is being suggested for the district of which Doncaster is the centre. A conference of coalowners, landowners, and local authorities was held at Doncaster in January to consider the question and take further action. There it is not a question of one local authority preparing a town plan, but of a combination of local authorities in the formation of a joint board, for the purpose of planning a large area, and the problem before them is how best to deal with a very rapid development of the South Yorkshire coalfield. Within a ten miles radius of Doncaster a big city is growing up, and there will be a population of a quarter of a million within a very short time. The preparation of a town plan here is so urgent as to warrant special Government action. It is an instance where the town planning procedure of Mr. Burns's Act will hardly meet the case, because it cannot be put into operation quickly enough. There is need for some simple expeditious method which, without making a complete and final town plan, will protect the area by some general allocation of open space, limitation of houses per acre, and settlement of the main lines of traffic—all of which can be ultimately done under the powers of the Act. Proceeding, the Chairman said that the Town Planning Act was sufficiently good to do more than justify the trouble that was taken to get it on the statute-book. He suggested that premiums should be offered in different districts to architects for laying out their localities on town-planning lines. The basis of town planning was co-operation between owners and local authorities. It had not cost £500 for the promoters of the Ruislip scheme to protect nine square miles of land from jerry planning and

CROSCOMBE CHURCH.

from the growth of insanitary districts within the area.

Mr. F. M. Elgood and Mr. E. R. Abbott having detailed their experience at Northwood-Ruislip, questions were invited and answered, and the meeting adjourned.

At the resumption of the conference, on February 24th, Mr. Harper, of Cardiff, briefly reported the proceedings at an interview obtained by several members of the advisory committee with a representative of the Local Government Board. The great point which the deputation had attempted to drive home was the desirability of simplifying and condensing the Board's regulations. It was pointed out by the official, however, that the regulations now in force can only be abolished by means of an amending Act, but that in the meantime they would be applied in a liberal spirit.

A memorandum which had been prepared on the subject for discussion was analysed by the chairman. It was explained that for the purposes of a town-planning scheme, power was given to local authorities under the new Act (Section 55, Sub-section 2) to relax or alter conditions relating to width of roads and methods of road construction. Those entrusted with the task of preparing town plans would without doubt carefully consider such points as the extent to which roads might be sub-divided for the purpose of separate treatment: (a) main arterial roads, (b) secondary roads, and (c) residential roads. Regarding main arterial roads, there was little doubt it would be necessary to provide in most town-planning schemes for roads of a greater width than was prescribed under existing by-laws. In June, 1907, figures were placed before the Association of

Municipal Corporations showing that the approximate expenditure out of loans by two-thirds of the great towns and municipalities on street improvements and street widenings during the past ten years had been on an average nearly one million pounds per annum. The planning of secondary roads under a town-planning scheme must meet both the need for the amenity of those dwelling in the houses, and the need of proper through communication; while in regard to residential roads, the first consideration was that of amenity—the pleasantness and agreeableness of situation.

Mr. Raymond Unwin said if they reduced the number of houses to the acre they were approximating to the conditions of the country districts, and there seemed no reason why they should not approximate the treatment of their roads to the treatment which was found satisfactory in the country districts. He had worked out the figures for two schemes on 20 acres of land laid out on the basis in one case of ten houses to the acre and in the other case of 12.3 and 12.4 per acre, and he found they could reduce the cost per house and land and roads together, assuming in both cases the land was worth £300 an acre, from £71 per house to £62 6s. by the concession of one road. That small concession made the same difference to the landlord as if they allowed him to put 140 more houses on the 20 acres. As to the character of the roads, he said there was no comparison between the value to the community of a fully macadamised road and a lighter road. He estimated that instead of fully macadamised roads costing £7 10s. per lineal yard, lighter roads could be constructed of £5 10s. and £3 per lineal yard. In reply to a remark by Mr. Edwards, of Merthyr Tydvil, that the borough surveyor there had submitted a scheme for concrete houses to cost £100 each, Mr. Unwin said that he had built such houses at £200 each.

Alderman Bennett, of Warrington, doubted whether the ideal conditions that were being put forward by town planners were applicable to industrial towns, where a great many of the workers received no more than 20s. or 24s. a week.

Alderman Griffiths, of Southport, suggested that special areas might be set apart for working-class populations, where there might be fewer roads, and consequently reduced expense. He doubted the wisdom of advocating narrower roads.

In reply to further objections, Mr. Unwin suggested the consideration that some of the arguments applied with more force to defects in the present land system than they did to faults in the Town Planning Act.

A delegate, speaking of the Woodlands Colliery Village, Doncaster, pointed out that in his district a 36ft. ordinary bylaw road cost about £2 10s. per yard, and a 50ft. road on the same proportion would be about £3 15s. per yard. The cost was about half that of an industrial road in a town.

The Chairman said he was assured that a garden city type of road had been found to work satisfactorily in an industrial district.

Professor Adshead said that in regard to the possibility of having amenable dwellings with large open spaces around them in an industrial area, they were rather losing sight of the fact that town planning was not quite such a local matter

as had been the application of bylaws. If there was one thing more unfortunate than another, it was the question of communication. What they had to consider in the first instance in town planning was the question of arterial communication. They must bear in mind that with the bylaws they had been merely dispensers of the law, but with this town planning they had to raise their level and put a little imagination into it, for now they were going to be legislators.

At the opening of the afternoon session, the Chairman drew attention to the fact that Section 10 of the Town Planning Act had been put into operation with regard to Chertsey, where, upon the representations of four parishioners, the Local Government Board had, for the first time on record, ordered the local authority to provide suitable working-class dwellings.

Mr. H. R. Aldridge, secretary of the National Housing and Town Planning Council, opened the afternoon discussion on the standards as to limitation of the number of houses per acre. Under existing bylaws, more than forty cottages per acre might be built. At Port Sunlight and Bournville the number was seven to the acre, at Letchworth twelve, at Hampstead Garden Suburb ten and a quarter, at Earswick (Yorks) nine and a half, while in the Cottage Exhibition Estates of the Sheffield, Newcastle-on-Tyne, and Swansea Corporations, arranged by the National Housing and Town Planning Council, the standard was twelve houses per gross acre.

A delegate from an industrial centre said that the average in his district was thirty houses to the acre, and he suggested that if the limitation was to be twenty, the ground rent would increase by fifty per cent.

Councillor Johnson, of Manchester, thought that the Act should have prescribed the number of houses to the acre, instead of leaving it to the local authority.

The Chairman said that, in nine cases out of ten, as a general principle, the Town Planning Act would apply to new areas. Mr. Unwin's mention of £300 per acre as the probable cost of land for town-planning schemes brought comments from various delegates, who severally estimated that in South Wales the cost per acre would be more than £600; in Fleetwood, £800; and in Little Hulton, £1,800. The Chairman observed that apparently the price of the land would be a very serious obstacle; and another would arise from the low wages, which necessitated low rents.

The exhibition arranged by Professor Adshead comprised many fine schemes of town planning, including the replanning of Bolton as proposed by Mr. Thomas Mawson, Hon. A.R.I.B.A., jointly with Mr. Robert Atkinson, A.R.I.B.A., in a splendid series of drawings; and Mr. Sydney Kelly's proposed Liverpool-Southport-Preston high road. The awards in the competition for the prizes offered by the Co-partnership Tenants, Ltd., to students in the Liverpool School of Civic Design, for the planning of the estate at Chidwell, Liverpool, were made by Mr. Raymond Unwin, the assessor, as follows:—1, £25, G. N. Dixon; 2, £10, J. Mawson; 3, £5, R. H. Mattocks. Mr. Henry Vivian, who presented the prizes, announced that his Board, in recognition of the high merit of all the designs submitted, desired to offer a further £5 to be spent in books to be shared among the eight competitors.

THE ARCHITECTURE OF SICILY.

At a meeting of the Manchester Society of Architects on February 23rd Mr. Ronald P. Jones gave a lecture on "Sicily." The two great architectural epochs of Sicily, that of the Dorian civilisation of the fifth century B.C., and the Norman of the twelfth century A.D. were illustrated with slides, and in the course of his remarks the lecturer said that the Sicilian colonists represented the more adventurous and vigorous members of the mother community, and founded cities far more populous and magnificent than those of their birth. The Temple of Segesta forms a good introduction to the study of Sicilian architecture. Its splendid isolation among the limestone hills, its restrained and reposeful style, provide an extraordinary instance of a weight of effect obtained by simple means. Here we find imposing scale and sombre magnificence, where all the refinements of detail are absent. It has come down to us as it left the hands of the builders, perfectly preserved, but still unfinished, for the building operations were interrupted by invasion in 409 B.C. This being so, it forms one of the most lucid illustrations of Greek methods of building. The peristyle was built before the cella, and the flutes were added after the erection of the drums. The rough local limestone of which the Sicilian temples were built was faced with a film of marble stucco, in which the mouldings and refinements were worked. This fine surface was polished and coloured. The Greeks had not the modern appreciation for the beauty of material in itself, just as they had not our love of natural landscape. To them, Pentelic marble was the best building material available, ensuring the highest possible finish. In Greece and Sicily the blaze of pure white marble is too dazzling, and the subtleties of form and light and shade cannot be appreciated unless the material is toned down with colour. The Greeks aimed at the highest possible finish, and looked upon joints as evils to be concealed by every possible means. Accordingly, in Sicily, by veneering the rough porous material, the difficulty of jointing was eliminated, and a monolithic appearance obtained. In order to understand these Sicilian temples, we must visualise their gay and decorative effect, their veritable blaze of colour, set among luxuriant groves.

The remains at Girgenti are placed in surroundings less tragic and isolated than those of Segesta. One of the largest and most luxurious of the city-states of the ancient world, Girgenti, with its population of 400,000 inhabitants, exceeded even Athens itself in scale and magnificence. The traveller approaching from the sea beheld a group of buildings of almost unparalleled splendour. Seven great temples crown a long narrow ridge of rock $1\frac{1}{2}$ miles in length and 300 ft. above the plain. The Greeks took advantage of the natural site, and did not level the rock, as the Romans would have done. The great building period was from 480 to 410 B.C. In the Temple of Concord we have one of the best preserved of Greek buildings, in that of Zeus, the most colossal and one of the few failures, the scale being beyond the possibility of the style.

Slides were shown of Syracuse, and Taormina with its unrivalled view, and the lecturer then passed on to Palermo and contrasted the internal magnificence of the mixed style of the twelfth century, as seen in the Capella Palatina and Monreale, with the external architecture of the earlier Greek civilisation. The beauty of these mosaics, with their wealth and colour and logical treatment, is unsurpassed.

SOCIETIES MEETINGS.

SHEFFIELD SOCIETY OF ARCHITECTS
AND SURVEYORS.*The Notable Buildings of Warwickshire.*

A meeting of the Sheffield Society of Architects and Surveyors was held at Sheffield University on February 23rd, when Mr. J. B. Mitchell-Withers, vice-president, gave a lecture entitled "A Visit in Warwickshire."

The lecturer attended the Congress held last year by the British Archaeological Association in Warwickshire, and the buildings described were almost entirely those visited during the Congress. He referred to the military importance of Warwickshire in ancient times, owing in a large measure to its central position in the country, and to the fact that several old Roman roads, including Watling Street and the Fosse Way, passed through or near its borders. He made a passing reference to a few remains of archaeological interest, and then proceeded to speak of Kenilworth, one of the strongholds held in the Norman period by the De Clinton family. The connection of John of Gaunt with this historic building was mentioned, and the large Hall and other portions erected by him were described, as were also the additions made by the Earl of Leicester, the favourite of Queen Elizabeth.

Other domestic buildings of the county were included, the moated grange of Baddesley Clinton, the charming brick and stone mansion of Compton Wynyates, and Wroxham Abbey, the seat of Lord North, which contains portions of the pre-Reformation structure.

The lecturer then described the ancient cities of Warwick and Coventry, with their interesting churches and other ancient buildings. He dealt particularly with the church of St. Mary, Warwick, which suffered from fire and was largely rebuilt at a time when Gothic architecture was more or less a lost art. The Chancel and Beauchamp Chapel largely escaped damage at the time of the fire, and these, with the beautiful tombs and stained glass contained in them, were described. The churches of Coventry, chief among which St. Michael's, with its magnificent tower and spire, were then dealt with, the lecturer calling particular attention to the connection of St. Michael's Church with the ancient guilds of the city.

Leaving the ecclesiastical buildings, the lecturer described Ford's Hospital, Coventry, and the Leicester Almshouses in Warwick. Part of the latter, he said, dated from 1383, although the present charity was not founded until 1571. The old chapel of St. James, adjoining the latter building and situated over the west gate of the city, led to a description of the east gate and the large and interesting Castle of Warwick, with its remains of feudal splendour. The lecture concluded with a reference to Rugby and its school buildings, including the chapel erected from the designs of the late Mr. Butterfield.

LIVERPOOL ARCHITECTURAL SOCIETY.

What is the use of Architecture?

This was the interrogative title of a lecture delivered by Mr. Edward Rathbone last week under the presidency of Mr. A. Thorneley, to the Liverpool Architectural Society, in their rooms, 13, Harrington Street. Mr. Rathbone answered the question by saying that the use of architecture was to stimulate appropriate feeling. All works of architecture must be social institutions; therefore the feeling to which architecture appealed must be a social feeling. The province of architecture was

to assist in making the home, the city, or the church, or one of the subdivisions of one of these institutions. As it was only by means of the social instincts that society was held together, it was the business of the fine art of architecture to foster these social instincts. Architecture dealt only with social institutions, and social instincts had evolved themselves into habits, conscious and subconscious, during the past ages of humanity. In Egyptian architecture was seen the expression of the desire or pride of power of the Pharaohs. In Greek work was seen the cultured vanity of Athens; in Roman the social affection of the Roman people misled with pride and vanity. In Gothic work veneration clearly proclaimed itself. The perfection of pure benevolence was left for the future, but the nature of that virtue was first clearly seen in the poetry of William Shakespeare, who could sympathetically understand even a Macbeth or Shylock. Whatever might be the institution—whether a lawyer's office, a small-profit-and-quick-return shop, or a street down which people walked—it should have its appropriate tone, and expression, which should give those who used it an agreeable sense of ease with the office performed there.

BRISTOL SOCIETY OF ARCHITECTS.

Mr. E. A. Rickards on Civic Ornamentation.

At a meeting of the Bristol Society of Architects, held last week at the Fine Arts Academy, Queen's Road, Mr. E. A. Rickards, F.R.I.B.A., the architect to the Bristol King Edward Memorial Executive, gave a lecture entitled "Civic Ornamentation," which was illustrated by lantern views.

Mr. Rickards said the English had almost everything to learn in that department of art. By the ornamentation of the city, he included all that might serve as amenities in any form to the life of the people. London was without a public space or square, or even the smallest clearing, that was comparable to the average in any Continental town. Was there a public monument with any of the qualities of design which would justify its assertion of immutability and its claim as the uplifter of the more subtle side of their consciousness? As for the other accessories of their streets, could they by any glow of such enthusiasm be quoted? In making such a sweeping indictment, he was not unmindful of the many attempts at street decoration or the possibilities in the way of execution and craftsmanship already displayed, but they must admit the fact that there was behind all those efforts a certain lack of style. It was true they had an amazing record of effigies, admirable in themselves, but in what isolation they existed! Even the particular setting of those portrait figures had generally nothing which would link them to their surroundings. Some buildings, by their purpose of design, required the reflection of their style in the street accessories of their neighbourhood, and that should secure the employment of the same artist as much as if they formed part of the main structure itself, and thus characterise the immediate surroundings and enhance the object in effect. In that way would many a work of art be provided with a position in advance, which perhaps had never been otherwise called for. With regard to the temporary decorations of the city, it would readily be conceded that unless they were to obscure the design of permanent structures and arrangement they should be subservient to their

lines, or at least respond to the anatomy of the figures they were to adorn. The architect, with his sense of balance and knowledge of the salient forms of the subject to be dressed, should be an invaluable, and, in fact, the chief director. In this most restless age, when individualism was so continually asserting itself for the worst, there was need of direction and constant surveillance. In the course of his lecture Mr. Rickards frequently referred to ornamentation in Continental cities.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

Some Minor Domestic Architecture in Yorkshire.

A general meeting of this Society was held on February 23rd, Mr. Sydney D. Kitson presiding, when Mr. Harold Henderson, of York, read a paper on "Some Minor Domestic Architecture in Yorkshire." Confining his remarks to an analysis of the composition and detail of the buildings of the Dalesmen, Mr. Henderson said that these Yorkshire homesteads bore probably to a greater extent than in any other district in England the impress of the individual, the strenuous and unbending character of a race who lived in a generation of fierce and strict Puritanism. The houses were sturdy and strong, standing four square to the weather, perhaps in some cases grim and stern, testifying to the reserve of their owners in high unbroken walls, yet displaying nevertheless in occasional grotesque or quaint finish a dry wit as a tonic and saving grace. The great majority of the houses were of the seventeenth century owing to the great number of gentry who lived on the produce of the land at that time.

The characteristic features peculiar to these Yorkshire buildings were dealt with in detail in the description of a typical house with single span roof, an occasional gable ornamented by finials, a projecting porch with quaint doorway, and fully illustrated by a series of studies and sketches, by Mr. Henderson.

At the close a hearty vote of thanks was proposed by Mr. C. B. Howdill, A.R.I.B.A., and seconded by Mr. R. W. Thorp, A.R.I.B.A.; briefly responding, Mr. Henderson urged the closer study of the type of building of which he had spoken, to the end of reviving the Yorkshire Domestic Tradition—an influence now unfortunately almost extinct.

GLOUCESTERSHIRE ARCHITECTURAL ASSOCIATION.

Gloucestershire Brick Earths and Brick-making.

The President (Mr. Walter B. Wood) occupied the chair at a meeting of the Gloucestershire Architectural Association held at the Northgate Mansions on Thursday, Feb. 23rd, when Mr. L. Richardson (Hon. Fellow) gave a lecture on "Brick Earths and Brick-making in Gloucestershire." Mr. Richardson, in the course of his lecture, described the various ways in which bricks might be made, either by the slop process, semi-plastic, or plastic processes. The slop process was that which was adopted in the Severn-side brickyards; the semi-plastic at Robinswood Hill; while the plastic was that most generally used in Gloucestershire. He next described the various brick-earths available in the county, and said that a loam was the best natural earth. It, of course, was composed of sand and clay, but very excellent bricks could be made by mixing and grinding together sand and "strong" clay. This was done at the Battledown Works. The sandy beds that crop out in the lower portion of the slopes of the Cotswolds afforded

the best natural brick-earth in East Gloucestershire, and the beds could always be detected by their attendant growth of gorse bushes. The Stonehouse, Robinswood Hill, Pilford, and Aston Magna pits were all in this deposit. The Greet Potteries obtained their raw material from the same beds. Views of the extensive Cattybrook Works were shown on the screen. Here bricks were made of coal-measure shales, as is also the case at Shortwood, near Mangotsfield. At Stoke Gifford the red (Keuper) marls are ground up for brick-making purposes, and it was pointed out that this rock was largely used in the Midlands for this purpose. The lecturer emphasised the necessity of exercising great care in opening a brickyard. Suitable "earth," a site near a railway or proximity to a likely market, were essential desiderata.

ENQUIRIES ANSWERED.

Smoky Chimneys.

R. L. (WEST HARTLEPOOL), writes:—"Kindly give us your opinion as to the best cure for smoky chimneys (apparently caused by down draught), in a farm house constructed in an open part of the country."

—The chimneys apparently smoke owing to insufficient height above ridge, and possibly straightness of flues. An anti-downdraught pot may check the nuisance, which, if the building is new, is likely to abate somewhat as it dries and becomes warmer. G.

Area for Public Hall.

"QUERCUS" writes:—"I should be glad if you could tell me (a) The least area for a hall to seat 400 persons; chairs to be used, the hall being in a country district. Some authorities give 7 ft. super per chair including passages, but this seems rather full as compared with allowance per seat in theatres and music-halls.

(b) What price per foot cube be fair for a simply designed hall as above, in a large seaport town, with easy facilities for transport of materials, and good local bricks, stone, etc."

—(a) The allowance of 7 feet super per chair would be a lavish one. If a minimum spacing is desired, about 5 feet super per chair, inclusive of gangways, would prove sufficient, on a basis of 1 ft. 6 in. by 2 ft. 3 in. net per person, with passages extra. This would give a total area of 2,000 feet super, or say 36 ft. by 54 ft., which, with good planning of exits, should prove a workable size.

—(b) About 5d. per foot cube would be a reasonable basis of cost for preliminary estimates. X.

Pointing Reveals in Exposed Situation.

H. F. writes:—"Please give particulars of a successful way of pointing reveals of windows in a very exposed aspect so as to make them watertight. We have tried fine ground mortar with an admixture of hair, also mortar and cement, cement and sand, white lead and linseed oil putty, red and white lead, and lastly mastic cement and oil; but while one adheres to the wood casing of sash frame, it cracks away from the bricks, and another adheres to the bricks but not to the wood. The last named we have found the best, but even this has cracked from the wood casing sufficiently to allow driving rain to get in and run down, making a damp patch at the end of each sill. We have got galvanised iron water bars

between the wood and terra-cotta sills, and these appear to be successful, as the brickwork is quite dry in the centre of each window."

—If mastic cement has failed to exclude the water, it is probably useless to suggest any alternative material for pointing. It might, however, be worth trying the effect of the following:—Rake out pointing as deeply as possible, and point up to within about half-inch of face with common puddling clay well rammed in hard with a caulking tool. Point joint face with mastic. The theory of this system is similar to the old half-timber work of the Eastern Counties, in which the panels were filled with clay and wattles, plastered on face. Upon wet penetrating the joint (as it always must penetrate any joint between wood and a dissimilar material), the clay swells and prevents further ingress of moisture. Querist does not give any particulars of the form of reveal—if straight, either a metal water bar, or a check fillet of cement or wood would have been the surest means of stopping water penetrating; if recessed, a small molding fixed to frame in the angle of the reveal covering pointing might even now prove effective. G.

Cavity Walls.

W. B. (WHITEHAVEN) writes:—"It is the usual practice when building houses with cavity walls to put, say, 9 in. by 6 in. air gratings, chimneyed through the full thickness of wall; and, in order that no air may get from them into the cavity, to ventilate under the ground floor. Suppose 9 in. by 3 in. vents are placed at the bottom of the cavity, and also at the top for ventilating the cavity. What objection would there be to dispensing with the 9 in. by 3 in. gratings at the bottom of the cavity, and allowing the air from 9 in. by 6 in. vent to enter the cavity as well as to pass under the floor, and to omit air ducts from under the floor? Do you think that the grating at the top of the cavity would tend to draw any stagnant air from under the floors?"

—Though the method described as "usual" is probably the most common one for ventilating the cavity, the alternative proposed is not altogether novel, and various intermediate methods are also practised. The argument in favour of treating the ventilation of cavity and floor space as entirely separate is that moist air is formed in the cavity when the outer wall becomes damp, which tends, by its greater density, to descend into the floor space; and this it is considered desirable to avoid. On the other hand, it is undoubtedly the fact that when the walls are dry and the air in the cavity warm, there is a tendency for it to draw stagnant air from the floor space and so assist the ventilation of the latter. In some parts of the country the practice with regard to ventilating the wall cavity is to put in no external air gratings, but to draw air from the cellar or floor space inside, and to discharge it (also inside) above the attic joists. The chief objection to the intercommunication of the ventilation openings from the outer air to both floor and cavity is an extension of the general objection entertained by some sanitarians to hollow walls; that harbourage for small vermin is provided, leading to decaying animal matter accumulating in inaccessible positions, which by this method connects a supply of foul air to the floor space, whence it is drawn through joints and cracks into

the house. It is for querist to weigh the relative importance of the various advantages and objections.

THE NEW KING'S COLLEGE HOSPITAL.

It is now seven years since it was decided to remove King's College Hospital from its present position at the rear of the Law Courts to a site at Denmark Hill, in the south-east of London. A competition for designs was instituted, and Mr. W. A. Pite, F.R.I.B.A., was appointed architect. In the summer of 1909 his Majesty King Edward laid the foundation-stone, and since that date the building has rapidly proceeded. The Out-Patient and Casualty Department and Bathing Establishment, together with the administration block (shown by the accompanying illustration) are now roofed in and nearly completed; and there remain to be built the chapel, ward blocks, operation theatres, and some other smaller departments.

The total cost of the scheme, exclusive of site, will be £190,000.

In the old hospital there are 220 patients. The committee wish to open the new one with 328; and they desire to preserve the value of every portion of the existing site of King's College Hospital for future endowment. It is proposed to start with twelve wards and two special wards; and as time goes on to increase the accommodation to 600 beds.

On so eminent an authority as Sir David Ferrier, it is stated that the hospital, when completed, will be the best equipped that has yet been erected. The large out-patients' department has a fine central hall, seating more than 500 patients. Arranged round it are the various consulting departments, the plan having been so contrived as to provide that the patients who have seen the consulting staff will not again enter the waiting hall, but leave the building by another route.

The arrangements for dealing with casualty cases of all kinds—both accidents and cases of sudden illness—seem to be most effective. X-ray, dental, and children's departments are also provided, and a large and commodious section is allotted to baths of various kinds. King's College Hospital will, indeed, possess the most complete medical bathing establishment in London.

NEW HOSPITAL BUILDINGS.

Steps are being taken to erect a new general hospital in the Putney district, which will not only provide for the treatment of accidents, but also of patients suffering from general diseases. This has been made possible by the will of the late Mr. H. G. Chester, who left sufficient money to build a hospital accommodating fifty beds.

Mssrs. Young and Hall are the architects for proposed structural alterations to the North Staffs Infirmary.

Plans have been approved for an addition to the Stirling Fever Hospital, providing accommodation for ten beds in five wards, at an estimated cost of £1,600. A feature of the design is that the division walls between the wards are to be of plate glass to assist efficient supervision with a small staff.

Comprehensive extensions to the Chichester Infirmary costing close on £14,000 are anticipated. One of the leading features is a thoroughly up-to-date operating theatre. Mr. Ball is the architect.

Messrs. King and Son, builders, have just completed the new isolation hospital establishment to serve Egham and Old Windsor parishes. Mr. Walter Gray, of Egham, was the architect.

Messrs. Briggs, Wolstenholme, and Thornely submitted to the Select Vestry on February 7th estimates and outlines of a scheme for the proposed epileptic colony at Maghull. It shows accommodation for 300 patients at an approximate total cost of £46,000. It was decided to submit the scheme to the Local Government Board for approval.

Under the superintendence of Messrs. Evans, Williams and Evans, architects, a new cottage hospital has been erected at Pontypridd. Provision is made for sixteen beds, ten for men, three for women, one separation ward, and two children's cots. The contract sum was £3,590.

[Reconstruction of Hospitals in Glasgow.]

For some time past the hospital accommodation in Glasgow has been felt to be inadequate, says the "Lancet." Within the last three years the Maternity Hospital has been rebuilt on a very large scale, the Cancer Hospital has been practically rebuilt, the Royal Samaritan Hospital for Women has been enlarged, and the Western Infirmary has added a new block to its buildings. The Royal Hospital for Sick Children is to be rebuilt immediately on a better site, and with more than double its present accommodation. The Royal Infirmary is also in course of reconstruction; the block at present being built being that for special diseases, together with the third section of the surgical block, which will then be complete and will contain 200 beds. The new pathological block is also nearly completed, and it is the intention of the directors to proceed at an early date with the erection of a portion of the new medical block, which embraces nearly one half of the main frontage upon Cathedral Square, together with the east wing which connects the Cathedral Square block with the central or special diseases block.

THE QUALIFICATION OF ARCHITECTS

At a special meeting of the Edinburgh Architectural Association on February 24th, Mr. James S. Gibson, F.R.I.B.A., London, explained the proposed new scheme for the statutory qualification of architects of Great Britain and the Colonies. He stated that in 1910 the Institute obtained a supplemental charter, by means of which they instituted a new class, called Licentiates, who were either architects of thirty years of age and who had been five years in practice, or assistants of thirty years of age and who had been engaged for ten years in the study of architecture. Already there had been elected to that class more than 700 architects, and over 250 had sent in proposal forms, and were waiting election. It was expected that over 1,000 would be elected within the one year during which the class was to be open, and that period closed on March 23rd of this year. Immediately on the expiry of that period the Royal Institute would proceed to draft a Bill for the statutory qualification of architects, so as to put them on the same plane as doctors and lawyers—in other words, to close the profession to persons other than those qualified by examination. That step would improve architectural education throughout the country, as the only method by which an architect could begin practice would be by becoming a member of the Institute by examination.

ADMINISTRATION BLOCK OF THE NEW KING'S COLLEGE HOSPITAL, DENMARK HILL, LONDON, S.E.
WILLIAM A. PITE, F.R.I.B.A., ARCHITECT.

COMPETITIONS.

New Cumnock United Free Church.

Members and Licentiates of the Royal Institute of British Architects are requested not to take part in the above competition.—By order of the Council,—Ian MacAlister, Secretary, 1st March, 1911.

[The character of this competition is evident from the note at p. 224 of last week's issue.]

Bradford New Infirmary.

At the annual meeting of the authorities of Bradford Royal Infirmary, held on February 28th, Mr. George Priestman, chairman of the Infirmary House Committee, stated that, in response to advertisement, 79 of the best-known architects of the country had applied for ground-plans of the proposed new infirmary, and from the large number of competitive designs that might therefore be reasonably anticipated, "probably three of the selected sets of plans would be exhibited." Why restrict the number to three? It would surely be, on the whole, much more satisfactory to follow the usual practice of exhibiting as many as could be accommodated.

Castle Street Improvement, Swansea.

We understand that the date of this competition has been extended to May 4th. Mr. S. S. Reay, F.R.I.B.A., is the assessor, and there is no question as to the fairness of the conditions, or as to the competition being conducted on right lines: yet the proposed extension of time seems to indicate that the applications for particulars have been somewhat disappointing—probably for no better reason than that such a competition is somewhat of a novelty, this being apparently the first occasion upon which such a course has been taken by a provincial corporation. The corporation, being desirous of effecting a public improvement in Swansea, invite architects to submit designs and estimates in open competition for the elevations of the new buildings to be erected upon a site lying upon the east side of Castle Street, and having an area of approximately 2,496 square yards, with a frontage to Castle Street of 380 ft., and return frontage to Welcome Street and the Postern of 15 ft. and 30 ft. respectively. The architect whose design is adopted may be employed by the corporation to prepare the working drawings, etc., at the rate of 2½ per cent. upon the estimated cost of his design, which must not exceed £10,000, "and under no circumstances will he be entitled to receive more than £250." He will receive £50 upon his appointment, and the remainder on the satisfactory completion of the final working drawings. The corporation will not themselves erect the new buildings, but will let the land on building leases, and will supply the lessees with copies of all the working drawings and details of the adopted design, which the lessees will be entitled to use, employing any architect they choose. A premium of £50 will be awarded to the design placed second.

LIST OF COMPETITIONS OPEN.

MARCH 31. CHURCH, NEW CUMNOCK.—Particulars in our issue of March 1.

[R.I.B.A. request Members and Licentiates not to take part.]

MARCH 31. LIBRARY AND ART GALLERY, MANCHESTER.—The authors of ten selected designs will be invited to final competition. Prof. Reginald Blomfield, A.R.A., will act as assessor, in conjunction with the City Architect. Apply to Thomas Hudson, Town Clerk, Town Hall, Manchester.

APRIL 1. MUNICIPAL OFFICES FOR COUNTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 1. "OWEN JONES" COMPETITION FOR WALL-PAPER DESIGNS, etc. Designs to be submitted to the Board of Education by April 1. The competition is open to students in schools of design. Six prizes are awarded by the Society of Arts, John Street, Adelphi.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

MAY 4. STREET IMPROVEMENT, SWANSEA.—Architects are invited to submit competitive designs and estimates for Castle Street improvement. Block plan and particulars on receipt of one guinea deposit, to be returned to competitors who fulfil the conditions. Premiums: Not exceeding £250, for the architect appointed to prepare the working drawings; £50 to author of design placed second. Mr. S. Reay, F.R.I.B.A., has been appointed assessor. Apply Town Clerk, Guildhall, Swansea. (See note above.)

MAY 15. COURT HOUSE, ETC., CHESTERFIELD.—Derbyshire Standing Joint Committee invite designs from architects practising in Derbyshire, for a new court-house and lock-up, to cost £8,000. Assessor, Mr. Frank Baggallay, F.R.I.B.A. Apply to Mr. George C. Copstick, L.R.I.B.A., County Offices, Derby. Deposit of three guineas for particulars.

AUGUST 21. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

NO DATE. REMODELLING ASSEMBLY ROOMS, INVERNESS.—Particulars, (one guinea) from Thomas G. Henderson, Eastgate House, Inverness.

OBITUARY.

Mr. William Jenkins.

The estate of the late Mr. William Jenkins, architect, of Edgbaston, Birmingham, has been proved at £70,289 gross.

Mr. Benjamin Stocks.

Mr. Ben Stocks, a well-known architect of Huddersfield, died on February 27th, aged 72. He had designed some of the principal elementary schools and chapels in the district, in addition to mill property.

Mr. William Page Watts.

We regret to announce the death of Mr. William Page Watts, at his residence, No. 5, Groombridge Road, South Hackney, aged 91 years and six months. He was for many years a collector for the London and Middlesex Archaeological Society, the Surrey Archaeological Society, and the London Art Union. He attended on Monday, January 30th, a meeting of the Hampstead Antiquarian and Historical Society, and after only three days' illness he died on February 3rd. He was much employed in tracing pedigrees, and had produced "The Book of the Bokenham Family."

LEGAL CASES.

Joint Landowners' Building Rights.

In the Chancery Division of the High Court of Justice, Richard Lakeman sought an injunction to restrain Henry Moat from erecting, at Stocksfield, Northumberland, any building in breach of a deed of mutual covenants.—For the plaintiff, Mr. Ingpen, K.C., stated that defendant had been for many years a member of the committee of the Mutual Covenanters, and, like the plaintiff, was part owner of the building estate in question. Defendant had submitted to the committee plans for buildings which he desired to erect on the estate, but these were disapproved of because it was considered that the proposed buildings would be too near the fence of another owner, and because they did not conform to the style of building approved by the committee. Defendant complied with the request as to style, but declared that he was not bound as to the precise location of his buildings, so long as he did not infringe the building line. The object of plaintiff was simply to maintain the rights of the fifty-three people who owned the estate. It was a very common thing for people in Newcastle to join in this way to buy an estate.

His Lordship: I am very glad to hear it. It seems to me to be a very wise course.

For the defendant, Mr. Bramwell Davis contended that the committee had no power to determine the site.—His Lordship thought that the committee had a right to reject plans in which the position of the buildings appeared to them to be improper. Otherwise the estate might be built upon in a higgledy-piggledy manner. He would, therefore, grant a declaration that, under the covenant, the committee were justified in refusing to pass plans in consequence of the position of the buildings proposed. He would not grant a mandatory injunction ordering defendant to pull down the house he had built in defiance of the committee, but he would order him to pay the costs.

The Cummins System: A Question of Royalties.

On February 16th, in the Chancery Division, the Master of the Rolls concluded the hearing and delivered judgment in the case of Robert J. Cummins, of Pittsburg, U.S.A., v. W. J. Stuart, who is a builder and contractor of Belfast and Dublin. Plaintiff sued the defendant for royalties alleged to be due in connection with reinforced concrete, used according to what was known as the Cummins system, invented and patented by the plaintiff. By an agreement of April, 1907, the defendant was appointed sole licensee for the United Kingdom and European countries of the right to use the plaintiff's patented improvements, and to provide monthly accounts of all contracts entered into by him or his sub-licensees for the use of the patented system. Plaintiff alleged that defendant failed to keep the agreement. He accordingly asked that accounts should be taken. The defendant denied that he failed to observe the terms of the agreement. He further said that only one contract had been executed, and that he had tendered to the plaintiff the amount of the commission due upon it, but it had been refused. He counterclaimed to have the agreement set aside and to have an inquiry as to damages.—The Master of the Rolls decreed that the defendant should pay to plaintiff the amount of his liabilities calculated up to the 1st September, 1909, and the costs of the action. Defendant would also have to pay to plaintiff the royalties down to the issue of the writ.

NEWS ITEMS.

New Consulting Architect to Lincoln Cathedral.

Sir Chas. Nicholson, M.A., F.R.I.B.A., has been appointed consulting architect to the Dean and Chapter of Lincoln Cathedral.

* * *

New Parish Hall for Richmond.

In connection with St. John's Church, Richmond, Surrey, a new parish hall is being built, from designs by Mr. Arthur Grove, architect, of 1, Hare Court, Temple. The building will include a hall 60 ft. by 32 ft., with main entrance in Church Road.

* * *

Works in Reinforced Concrete.

Messrs. Jas. H. Tozer and Son, Ltd. (Lock Woven Mesh System) have secured contracts for erecting a single coal bunker of 300 tons capacity, and a water tank for 50,000 gallons, also walls and floor to the power house for the Skinningrove Ironworks Co., Ltd., Yorks.

* * *

A Valuable City Site.

The New Synagogue, Great St. Helen's, is to be closed and the site offered for sale. The synagogue was built in 1837, and the value of the site is estimated at over £100,000. It is long since so large an area close to the Bank of England and the Stock Exchange has been placed on the market.

* * *

Transactions of the London Town-planning Conference, 1910.

The R.I.B.A. are issuing free to every member of the Town-planning Conference held in London last October a copy of the Transactions. Owing to the numerous applications for additional copies, however, the Council have decided to issue a special edition at the price of 28s., or 21s. net if the order is given by March 13th. The volume comprises 700 pages, with 300 maps, plans, drawings, and photographic illustrations.

* * *

Hull Town Hall Extension.

A proposal to pull down the Hull Town Hall in Lowgate and rebuild it in harmony with the new extension, now approaching completion, is receiving the close attention of the Hull Corporation Property Committee. The scheme is estimated to cost from £20,000 to £25,000, and it is indicated that, in the event of the old building being retained, about £6,000 would have to be spent upon it in repairs.

* * *

Cardiff Exchange Improvements.

The directors of the Cardiff Coal and Shipping Exchange have accepted the tender of Messrs. E. Turner and Sons for the carrying out of the alterations at the Exchange. The amount of the tender is £7,228. Ten firms sent in tenders for the work, which has to be completed within six months from the signing of the contract. The plans for the alterations have been prepared by Mr. E. Seward, F.R.I.B.A.

* * *

Stirling Old Bridge.

Recently a joint committee of representatives from Stirling Town Council and from the Central District Committee of Stirling County Council met at the Old Bridge of Stirling, when a report was submitted by the Burgh Surveyor, along with the County Surveyor, on the condition of the bridge.

From the report it appeared that the outer rings of the arches are spreading gradually towards the top of the arches and that the parapets are also swinging out, this being caused probably by the roadway, which is paved with whin rubble with earth joints, not being impervious to moisture. It was recommended that a joint application be made by the Town Council and the County Council to the Commissioners of Works, asking them to become guardians of the Bridge under the Ancient Monuments Protection Acts, and that, if the Commissioners make a condition of doing so that the Bridge be closed for vehicular traffic, the Town Council and County Council consent to this being done.

* * *

The French Palace at Aldwych.

It is announced that the whole of the capital required—£1,000,000—for the construction of the French Palace of Arts and Industries on the Aldwych site has now been subscribed. The company state that within the next few weeks a stand containing some 6,000 seats for viewing the Coronation procession will be erected on part of the land, and that the exhibition buildings will be commenced towards the end of June.

* * *

The New Quebec Bridge.

For the construction of the new Quebec bridge the tender submitted by the St. Lawrence Bridge Company has been recommended for acceptance. The firm in question is composed of the Dominion Bridge Company and the Canadian Bridge Company, of Walkerville. The tender price is about £2,770,000, and it is stated that if the contract is given to the company, new machinery to the value of some £410,000 will require to be purchased for the work.

* * *

The "Lycidas" Statue.

It will be remembered that in 1905 considerable controversy was aroused by Mr. J. Havard Thomas's life-size statue entitled "Lycidas," which, after having been rejected by the authorities of the Royal Academy, was exhibited at the New Gallery. This statue has been presented to the nation by Mr. and Mrs. M. E. Sadler through the National Art-Collections Fund, and is now exhibited in the Statuary Hall of the National Gallery of British Art (Tate Gallery), Millbank.

* * *

Grecian Marblers (Marmor).

A company under this title was registered on February 15, with a capital of £200,000 in £1 shares, to carry on the business of quarry masters and marble and stone merchants, workers of marble and stones of all kinds, etc.; to acquire the undertaking and assets of Marmor, Ltd., and to adopt an agreement with W. J. Heriot and J. Howden. The signatories are: H. T. Jarman, 158, Mill Lane, N.W.; C. W. Morgan, 37, Homecroft Road, Sydenham, S.E.; B. Young, 58, Fullerton Road, Wandsworth; F. Inder, Emmanuel Cottage, Worcester Park, Surrey; A. E. Mitchell, 30, Grasmere Road, South Norwood, S.E.; H. L. Armstrong, 488, Seven Sisters Road, South Tottenham; W. W. Miller, 9, Belgrave Road, Walthamstow (one share each). Minimum cash subscription, seven shares. The provisional directors are: H. T. Jarman, C. W. Morgan, B. Young, F. Inder, A. E. Mitchell, H. L. Armstrong, and W. W. Miller.

The Coronation Exhibition.

An army of workmen is engaged at Shepherd's Bush in carrying out preparations for the Coronation Exhibition, which opens in May. The nature of the task may be gathered from the fact that the painting and decorating of the buildings alone consumed 150 tons of paint; 30 miles of roads have been put under repair; 160 miles of cable have been relaid, and 40 additional miles laid down; while nearly 4,000,000 electric lamps are being fixed for the illuminations, which this year will surpass anything that has been attempted before at the White City. The gardens are receiving special attention, and nearly half a million plants have been laid out.

* * *

Calculator for Reinforced Beams.

A leaflet issued by Messrs. J. Halden and Co. (Limited) describes the "Twelve-trees" calculator for reinforced concrete beams, which is a mechanical device capable of reproducing in graphical form the conditions obtaining in the beams under load. The calculator measures about 6 in. square, and has white celluloid scales, burnished brass cursor, and pivoted index. At each setting of the instrument an arrangement of its moving parts is effected by one movement of the hand, and a stress diagram then gives the actual stress intensities and other correlative values required by the designer.

* * *

Preservation of Whitgift Hospital.

The Croydon Borough Council was informed last week that in reply to its application for compulsory powers to further widen North End, bringing the new frontage line to within a short distance of the Whitgift Hospital, the Local Government Board had declined to give its sanction until it received a complete scheme from the Council. At the public inquiry, Dr. Martin, for the Whitgift Hospital Preservation Committee, strongly opposed the application of the Council on the ground that its ultimate intentions regarding the old almshouses were not disclosed. On the other hand, the Town Clerk declared that the scheme left the future of the hospital quite an open matter.

* * *

Proposed New Bridge for the Medway.

The Bridge Wardens have decided to reconstruct the bridge over the river Medway at Rochester on account of the insufficient headway for navigation and of the deterioration of the present structure under the heavy tramway, motor, and general traffic that was not contemplated 50 years ago when the bridge was erected. The total length of the present bridge, with approaches, is about 1,075 ft. When reconstructed the bridge will have its centre line coincident with that of the existing bridge, the main arched spans being replaced by steel girders of open braced type. This substitution of girder for arch will give the required increase to the head-room under the bridge. The opening at the Strood end will be spanned by ordinary plate girders. The girders of the main bridge will be spaced at 30 ft. 2 in. centres, giving 26 ft. of clear roadway. Footways 7 ft. wide are carried on extensions of the cross girders beyond the main girders, making 40 ft. in all. The substitution of two girders for eight ribs makes it necessary to provide some method of distributing a load from two points over a foundation designed to carry its load at eight points. This will be effected

at the piers by means of deep trussed girders resting on the existing cast-iron skew-backs, and carrying the girder bearings. There will be a girder for each pair of bearings. At the abutments the load is distributed through a plate girder resting on three grillages. The contract for the reconstruction has been let to Messrs. John Cochrane and Sons, and the work will be completed in about two years' time. The engineers are Messrs. Baker and Hurtzig and Mr. John J. Robson.

Explorations of Roman Britain.

At a recent meeting of the British Academy, Professor Haverfield, Fellow of the Academy, gave a summary of his second annual report on the principal explorations of Roman Britain during the past year. Lord Reay presided, and there was a large attendance of Fellows of the Academy. Professor Haverfield said that the past year constituted in some ways almost an epoch in Romano-British research. Several well-known excavations, continued for many years, had just come to an end. Work had ceased at Silchester in 1909, and at Caerwent and Newstead in 1910; of explorations conducted on an extensive scale, only that of Corbridge was still in full course, and no new undertaking had taken the three vacant places. The scheme for the uncovering of Verulamium, outside St. Alban's, promoted by the Society of Antiquaries, had died still-born, as had been announced in the newspapers. The scheme for the uncovering of Viroconium, Wroxeter, near Shrewsbury, was still in its cradle, though good hopes might be entertained of its future. There had, indeed, been smaller excavations—at Hucclecote, near Gloucester, where many interesting, but as yet imperfectly deciphered tile-inscriptions had come to light; at Holt, where Mr. Acton seemed to have hit on tile-works and pottery works used by the Twentieth Legion, quartered eight miles away, at Chester, and on several smaller sites; but the total of spade-work seemed somewhat small. On the other hand, much had been written.

A West London Improvement.

A street improvement proposal of great importance to West London is to be submitted to the Paddington Borough Council and the London County Council, backed by the support of the leading drapery firms in Queen's Road and Westbourne Grove, Bayswater. It provides for the construction of a large circus—to be known as Westbourne Circus—at the junction of Queen's Road and Westbourne Grove, and the conversion of a comparatively insignificant thoroughfare now known as Pickering Place into a continuation of Queen's Road, leading from the proposed circus. The promoters propose that the London County Council shall be asked to contribute to the heavy cost of the proposed improvement, as it is essentially one of importance and value to the whole of London.

Proposed New School Buildings, Wallsend.

The Northern Architectural Association, 6, Higham Place, Newcastle-upon-Tyne, issued, on March 2nd, the following circular:—"The conditions of this competition have been considered by the Council of the Association, and I am requested to draw your attention to the following: 'The promoters do not state that an architectural assessor will be appointed to make the award, nor is any pledge given that the author of the design placed first will be employed to carry out the work (unless there is some valid ob-

jection to his employment).' In these respects the conditions are a distinct violation of the regulations issued by the R.I.B.A., and I am requested to ask members not to compete unless the conditions are modified.—Charles S. Errington, hon. secretary."

Historic French Chapel in London Closed.

That historical monument of the French Revolution, the French Chapel of St. Louis de France, situated at Little George Street, Portman Square, was closed on Sunday, February 12, and, it is stated in the "Morning Post" that no further services will take place there. The Chapel has a very interesting history, having been established on March 15, 1799, by Monsieur l'Abbé François Emmanuel Bourret, of the Compagnie de St. Sulpice, to meet the needs of the refugees from the French Revolution. Amongst those who attended services within its walls were King Louis XVIII., the Comte d'Artois, the Ducs d'Angoulême et de Berri, the daughter of Louis XVI. and of Marie Antoinette, the Duc de Bourbon, and the Ducs d'Orléans, de Montpensier, et de Beaujolais. The obsequies of Marie-Josephine de Savoie, wife of Louis XVIII., took place in this chapel, the Cardinal de Talleyrand-Périgord, Archbishop of Rheims, officiating, and here, also, were conducted the funeral services of the Duc de Montpensier and the Duc de Beaujolais, brothers of King Louis Philippe. The Comte de Paris made his first communion in the Chapel, it being administered to him by Cardinal Wiseman on July 20, 1850, also the Duc de Chartres in the following year, and the Prince Imperial fulfilled his religious duties here before setting out on his fatal journey to South Africa; and here, on October 27, 1886, the Princess Hélène of Orléans, subsequently Duchesse d'Aosta, was confirmed by Cardinal Manning.

FEDERATION NEWS.

Bath.

The annual dinner of Bath Master Builders' Association was held at Fortt's Restaurant on February 14th, Mr. Stephen Ambrose, president, in the chair. The chief items in the toast-list were as follows (the name of the proposer in each instance coming first):—"The Mayor and Corporation," Mr. W. A. Sheppard, the Mayor of Bath, and the Town Clerk; "The Architects, Engineers, and Surveyors," Mr. A. W. Willis, Mr. C. J. Calvert, and Mr. E. Keene Oliver; "The National and South-Western Federation of Master Builders," Mr. F. J. Blackmore, Mr. W. E. Drew, and Mr. A. G. White, National Secretary; "The Bath Master Builders' Association," the Mayor, and the President of the Association.

Darlington.

After a lapse of 35 years, the Darlington and District Master Builders' and Allied Trades' Association have revived the custom of having an annual dinner. This took place at the King's Head Hotel, on February 23rd, Mr. M. Mackenzie presiding.

Mr. John Guthrie presented a framed portrait group of the association, a gold-mounted umbrella, and a case of pipes to Mr. J. Johnson, the retiring hon. secretary. Mr. Johnson returned thanks, and said that he would like to see Darlington not only federated, but become a centre itself.

The toast of "Our Guests" was proposed by Mr. Thos. Brown, and responded to by Mr. W. H. Hope and Mr. J. Johnson.

Redditch.

The fifth annual dinner of Redditch Master Builders' Association was held at the Unicorn Hotel, Mr. A. E. Edkins, president, in the chair. The chief items in the toast-list were as follows:—"The Redditch Master Builders' Association," Alderman G. W. Hobson, Mr. A. E. Edkins; "The local governing bodies," Mr. J. Gross, Mr. L. F. Lambert; "The visitors," Mr. G. Huxley, Mr. F. W. Amphlett, Mr. R. J. Webb, and Mr. W. Jameson; "The Architects," Mr. F. Newbould, Mr. A. J. Dickinson, Mr. F. F. Baylis; "The President and Vice-Presidents," Mr. Lambert, Mr. A. E. Edkins, Mr. H. Holloway; "The Secretary," Mr. F. C. Huins, Mr. F. Turner; the first name in each case is that of the proposer.

Yorkshire Federation.

The monthly meeting of the Executive Comtee. of the Yorkshire Federation was held at the Builder's Exchange, Cross Burgess Street, Sheffield, on February 16th, 1911. Mr. A. J. Forsdike, president, who occupied the chair, was supported by 51 delegates from the Federated Associations.

The President called attention to the sudden death of Mr. John Pickard, of Leeds, a past President of the Leeds Association, and for many years a delegate of the association to the Yorkshire Federation. A letter of condolence had already been tendered to the family.

The accounts having been passed, the treasurer urged the local associations to make early payments of their subscriptions, in order that the efficiency of the Federation might be maintained.

A letter was read from Mr. J. Vickers Edwards, West Riding Architect, pointing out that as far as possible arrangements were made to have the final payments made in compliance with the contracts entered into, but that a very great deal depends upon the builder himself in sending in accounts, submitting receipts for prime cost items paid by him, etc. The secretary was instructed to make similar representations to Mr. Stewart, the Architect of the West Riding Education Department.

A report was submitted of a conference which was held at the Huddersfield Building Trade Exchange, with Mr. A. J. Sherwell, M.P. for Huddersfield, whose attention was called to the arbitrary manner in which many clerks of works exercised their duties in respect of supervision of Post Office contracts, entailing heavy financial loss on contractors, without any commensurate structural benefits. The secretary of the Federation explained the nature of the experience collated by and through the courtesy of members, and emphasised the points to which the consideration of H.M. Office of Works had been respectfully invited. Mr. Sherwell promised that the matters brought under his notice should receive his most careful consideration and that he would take the earliest opportunity of conferring with the Office of Works, with a view of ascertaining how far the wishes of the Federation could be met.

Attention was drawn to the requirement in certain Corporation contracts (Sheffield and Leeds) for priced bill of quantities to be enclosed with tender. As this is contrary to the strong recommendation of the Federation, special circulars were sent to members requesting them to conform loyally with the recommendation, as it is only in this way that the effectiveness of the Federation to safeguard the interests of members can be adequately maintained, and the imposition of additional causes of complaint and irksome conditions obviated. The loyal and sympathetic co-operation of members is cordially acknowledged and warmly appreciated.

The President reported that full verbatim reports of the case of Wallace v. Douglass were being printed, and that the Federation had ordered 100 copies in order that each local association may have one or two supplied for the guidance and information of federated members.

Attention was drawn to the great desirability of the Local Association in an area in which the Local Authority was seeking to obtain powers for electrical wiring and fitting, to take diplomatic advantage of such application by seeking to obtain clauses for the protection of electrical contractors; providing that the actual work would be carried out by such contractors instead of being executed by a Corporation Electrical Works Department.

A letter was read from the Board of Trade requesting the attention of the Federation to certain particulars with regard to apprenticeship in the various sections in the building trade, and requesting to be favoured with observations thereon. The points to which particular attention was directed are:—(a) How far is a "regular" apprenticeship (i.e., under indentures, or some other formal agreement) the prevailing method of recruiting the various skilled branches of the industry? (b) How are journeymen obtained in any branch, if not by apprenticeship? (c) Can anything more be done to improve the present system for training skilled workpeople?

It was decided to bring the subject forward for discussion at the next meeting, and local associations were requested to forward their views on the phases named.

Messrs. A. J. Forsdike and J. W. Mallinson were appointed to attend the Liverpool Town Planning Conference on February 23 and 24, as representatives of the Federation.

It was resolved that the Federation exercise of the option under the National rules, accept the commuted basis for the current year, and undertake to pay a subscription of £105 6s. 8d. to the National Federation.

Attention was called to a recent legal decision in which emphasis was laid on the importance of insisting that all contracts with local authorities shall be under seal; and reference was also made to the case of Bowers v. Chapel-en-le-Frith R.D.C., in which it was held that where the contract specified the use of a special appliance made by a particular firm, the contractor could not be held responsible for its alleged defects.

Other matters dealt with referred to the official journal, the telephone system, and some unsatisfactory features of policies ensuring against workmen's compensation.

The next meeting will be held in Wakefield on Thursday, March 16th.—J. DAVIDSON, Secretary.

The Crisis of an Acute Controversy.

WE have no intention of inflicting upon our readers a detailed history of the almost incredibly inept affair now so widely known as the St. George's Hall Controversy. From its inception some six months ago, the affair has been marked by a display of municipal obtuseness that ought to be, if unfortunately it perhaps is not, without

parallel. It will be remembered that the notion of cutting into the podium of St. George's Hall, to provide a setting for a large equestrian statue of the late King, originated first with the eminent sculptor, Mr. Goscombe John, who submitted to the Liverpool Corporation Memorial Committee a model showing an arrangement of oblique steps flanking a pyramidal group of sculpture. The members of the Memorial Committee expressed their entire approval of the conception, which was ultimately submitted to the Council for ratification. In face of a storm of professional disapproval, the City Council, at a general meeting, referred the matter back "for further consideration," and it was popularly supposed that nothing more would be heard of it. The Memorial Committee, however, instead of accepting the rebuff as final, and devoting their energies to the discovery of an acceptable site, persevered with the project. A committee of London experts was called in, and Mr. Norman Shaw put forward a model in which Mr. Goscombe John's steps were reversed, and a single pedestal replaced the three originally proposed. In spite of the fact that Sir Aston Webb and Professor Reginald Blomfield—both members of the expert committee—strongly opposed the adoption of such a scheme (or, indeed, of any project involving alteration of the fabric of St. George's Hall), the municipal authorities seemed determined to push the matter through. No sooner was this decision rumoured (in February) than the most extraordinary opposition sprang up in all quarters. In spontaneity and completeness the protest was unique of its kind. The most eminent American architects, the architect members of the French Academy of Fine Arts, the Council of the Royal Institute of British Architects, the Presidents of nearly every English provincial society, and innumerable artists and *savants* of distinction, published protests and signed petitions against the execution of any proposal affecting the integrity of the Hall—a masterpiece regarded by the whole cultured world as a cosmopolitan inheritance: Mr. Belcher being the only architect of eminence who could be cited as supporting Mr. Shaw's proposal. Mr. Norman Shaw's scheme had in the first case been passed over the heads of Sir Aston Webb and Professor Blomfield by the votes of the two sculptors on the expert committee, Mr. H. Thorneycroft and Mr. Goscombe John. But a sudden realisation of the nature of their position—consequent upon the universal outburst to which we have alluded—apparently caused the Finance and Memorial Committees to reconsider their programme. An atmosphere of uncertainty, even of misgiving, began to pervade their counsels, and they sought refuge in compromise; but, with the obliquity of mental vision peculiar to civic bodies when confronted by any vital problem in

æsthetics, they attempted to placate their opponents by offering to forego just those things that were of least importance, whilst retaining all that was vitally and essentially objectionable. Perceiving that Mr. Shaw's scheme was likely to bring upon them nothing but odium, the suggestion of a Mr. Cohen, deputy-chairman of the Finance Committee, was eagerly seized upon. This gentleman proposed the adoption of Mr. Shaw's scheme in so far as it related to the steps, but the substitution for the central figure of two flanking equestrian statues, one at each end of the podium. The particular meeting at which this proposal was adopted revealed extraordinary want of knowledge of the history of the Hall. Elmes, for example, was held responsible for a printer's engraving made seven years after his death.

The Memorial Committee, supported by the finance members of the Council, had next to consider the advisability of accepting Mr. Cohen's proposal. Meanwhile, so sensitive had the former body become, under the continued condemnation of the architectural profession, and more especially under the derisive contempt of the local public, that its deliberations were held in private—only a brief and entirely non-committal report being furnished to the Press. It was decided again to consult the expert committee, but the precise manner in which the opinion of the experts was to be obtained was not divulged. Subsequent enquiries showed that, beyond receiving a quite unofficial communication from Mr. Goscombe John, neither Sir Aston Webb nor Professor Blomfield were ever approached in reference to the matter. The attitude of the other selected experts toward the amended version of Mr. Norman Shaw's design was not made public, but ultimately, on February 22nd, the Memorial Committee recommended that an equestrian statue in plaster should be made and erected at the south-east angle of the podium—i.e., on the position advocated by Mr. Cohen.

Unfortunately for the promoters of this new scheme, the Finance Committee would have none of it. On February 24th they rejected the proposal to erect a plaster model, but still adhered to the introduction of the oblique steps. The cost of cutting the two holes into the podium and building the steps was estimated by the city surveyor at £2,600. Why the Corporation should be requested to undertake such work when once the latter is dissociated from the idea of a Royal Memorial, it is not easy to conceive. Perhaps the municipal authorities have an idea of wearying out professional and local opposition by dragging the matter on some months longer, but in this event they will find themselves much mistaken.

At a general meeting of the City Council on March 1st, the question of the steps was raised, but no definite action was taken, though several pointed references were made to the fact that whatever the Finance and Memorial Committees may propose must be ratified by the Council before it can become operative. The most important feature of the proceedings was the presentation of a petition against any tampering with the Hall, signed by eighteen of the most influential merchants in the city. The issue, therefore, has now reached a curious state of confusion. The next step lies with the Memorial Committee, but what line of action they will take it is impossible to foretell. Their dilemma is a double one. In the

first place, their enthusiastic championship of Mr. Shaw's scheme has been completely ignored by the Finance Committee, who mutilated the design in the most drastic fashion. Secondly, their disregard of expert protest being based on a professed reliance on lay approval, the petition of eighteen of the most influential and representative Liverpool citizens removes the last pretext for laying hands on Elmes's work at all. In addition to all this, the indisputable evidence of drawings proving the present design of the podium to have been Elmes's first intention of Cockerell's ultimate conception has been brought home to the Liverpool public in the most convincing fashion through a local Press controversy in which Professor Reilly has given the necessary data with a lucidity fatally damaging to the municipal case for interference with the structure.

For no valid reason, politics appear to have become mixed up with the question, and the voting in the Committees has on more than one occasion been apparently on merely party lines. An unfortunate proposal to remove the Beaconsfield statue has in some obscure way further embittered the controversy.

In short, the real object of the memorial has by now become strangely obscured; the authorities responsible for the ill-advised selection of the site being, apparently, bent on cutting steps in the podium in order to justify the expenditure of time and money already involved. The irony of the situation needs no emphasis.

The New Rooms at the National Gallery.

ON Friday last the new rooms at the National Gallery were thrown open to a large crowd of privileged visitors, admitted by invitation cards. The rooms, which form a very important addition to the interior space, present nothing very remarkable in an architectural sense, the main object being to show off the pictures well, the pictures themselves forming the decoration. The doorways have casings of grey marble, the ceilings are white, with a certain amount of modelled ornament in the shape of wreaths, etc., of a not very remarkable character; we should have preferred to have seen the soffits of the ribs treated in a rather more severe manner instead of the rather ragged-looking foliage ornament in high relief. All this detail, in fact, is somewhat commonplace, and might easily have been otherwise; but it may be said at all events that there is nothing in it to distract attention from the pictures. But all the rooms show the most important merit that a picture-gallery can have, that of an excellent light, obtained through skylights in the rake of the roof; the old heresy of having a flat glass roof with an exterior skylight above, which has made havoc of the lighting in some picture galleries, being now, one may hope, entirely discredited. In the long room at the end of the suite the light is so good that some old favourites, Gainsborough and Wilson landscapes especially, seemed to come out with quite a new effect. The pictures have been most effectively arranged and grouped, and Reynolds's monumental work, "Three Graces adoring the Bust of Hymen," hung so as to appear as the close of the vista through the whole suite of rooms, fills worthily that commanding position.

Architects as Artistic Draughtsmen.

IN the March issue of *The Architectural Review* are two finely illustrated articles concerning the quality of draughtsmanship displayed by the greatest of English architects—Inigo Jones—and by one of the most brilliant architectural professors of modern times—C. R. Cockerell. Four magnificent drawings by the latter are reproduced in the issue. They are all of conjectural restorations of Ancient Rome, and depict respectively the Temple of Capitoline, the Temple of Trajan, the Ulpian Basilica, and the Forum of Nerva. The accompanying letterpress is by Mr. R. Phené Spiers, who says that these drawings, with several others, were found in the vaults of Old Burlington House, where they had probably lain since the property of the Academy was removed

(about 1869) from the National Gallery to their new quarters in Piccadilly. Inigo Jones's great skill is shown by a portrait drawn by himself, and a cartouche with figures around, forming part of the Burlington-Devonshire Collection at the Royal Institute of British Architects. These drawings, as Mr. J. Alfred Gotch points out in an article accompanying the illustrations, exhibit a vigour and incisiveness which few of our best painters could exceed. There are between thirty and forty drawings in the Institute collection which may reasonably be considered as the handiwork of Inigo Jones, and they point the same moral—that he drew best when free from the trammels of architectural instruments. This does not necessarily detract from his fame as an architect, although it is opposed to the thesis that fine architectural draughtsmanship produces fine architecture. Inigo Jones must have had by nature a keen sense for proportion, which he cultivated when he traversed Italy with Palladio's "Architecture" in his hand. It was there that he acquired his style of drawing and his manner of making sketches, which bear a curious resemblance to those of the many Italian architects of the period, great and small. No wonder, with his gifts that way, that he acquired a facility in freehand when wandering through Italy; but that he studied architecture as well is proved by the notes he made in his "Palladio" as he went from one famous building to another.

There are many other attractive features of the March *Review*, among them being an excellent article by Mr. Walter H. Godfrey on Sir Thomas More's house at Chelsea (which offers a most interesting study in Elizabethan planning), and the concluding portion of Mr. Arthur Keen's article on "The Ceilings of the City Churches." Current architecture is well represented by a series of photographs of the new home of the Institution of Electrical Engineers on the Embankment (where some clever work has been done by Messrs. H. Percy Adams and Charles Holden); Royal Exchange Buildings, by Messrs. Ernest George and Yeates; St. Chad's Church, Longsdon, and the organ at the St. Paul's Girls' School, Hammersmith, by Mr. Gerald C. Horsley; and a design for a Church of Humanity, by Professor Reilly; while, occupying the entire Town Planning Supplement, is a fully illustrated article on the Ruislip competition.

Obsolete Phraseology in Specifications.

THE designation of obsolete materials in specifications is a grievance that the builders are evidently "nursing" to keep it warm. Mr. James S. Holliday put forward a powerful plea for reform in the course of his interesting lecture recently delivered before the Institute of Builders. His subject, as will be seen from the extracts given in another part of the present issue, was "Timber: Its Growth, Diseases, Seasoning, and the Principal Uses of its Most Important Kinds," and he found a legitimate occasion for remarking that while specifications should define what timber may be used, and so convey to the mind of the contractor what is wanted, this unfortunately is what many of the clauses do not achieve. Those familiar with the working of the building trade, he said, are aware that the out-of-date phraseology used in many specifications is sadly in need of reform. Disputes and misunderstandings are constantly arising because timber is specified which it is impossible to obtain, while the kinds that very often are most suitable and are easily obtainable are not specified at all. The ports which send us the best sawn carcasing and joiners' timber—Archangel, Petersburg, Soderhamn, Gefle, etc.—are not those from which the logs of timber they have superseded used to come; and whereas in the past the ports of origin were limited to about a dozen, there are now about a hundred places in Russia, Sweden, Norway, and Prussia, from which sound usable fir is exported. Moreover, Mr. Holliday points out that as the timber imported at the present time is not nearly so perfect as in former years, the rigid application of the old standard of quality can no longer be justly applied; hence

THOMAS H. MAWSON, HON. A.R.I.B.A., ARCHITECT.

the many disputes that arise from the sheer impossibility of fulfilling in every respect quite literally such descriptions as "free from sap, shakes, large and loose knots, and other defects." It would seem that the pick of the world's timber supply has been used up, and the proportion of wood that satisfies the demand that it shall be free from defects is so small as to make its cost exceedingly high. All this is quite well known to most architects, who, while adhering to the old inappropriate terms of specification, are willing that they should be reasonably construed. This, however, is an unsatisfactory position, both for the architect and the builder, tempting the one to stringency, and the other to laxity. Of course, in the majority of cases, neither the one nor the other will give way to such temptations; but it might be possible so to revise the common phraseology of specifications as to put the matter on a sounder basis. Conference between accredited representatives of the parties chiefly concerned—the architects, the builders, and the timber merchants—should make short work of the difficulties to which Mr. Holliday has so usefully drawn attention.

Garden Streets Out of London.

UNDER this heading Captain Swinton, of the London County Council, writes to the *Times* to caution Sir John Benn against forming hopes that, in the event of the proposed new main roads out of London being carried out, there will be an extensive recoupment of the outlay from the frontages of these roads. One express purpose of the roads, he points out, will be to carry a great amount of fast long-distance traffic, which must be accompanied by noise and dust, concomitants which will not induce people to rush to live close to the roads. The actual margins of the roads would from this cause be depreciated rather than enhanced in value as building land; people may rush for convenience to live near the road, but not on it. Captain Swinton therefore advocates "Garden Roads," with the building kept back. The idea is a delightful one, and would add a new beauty to

London approach roads; but it would mean an increased expenditure in the purchase of land, possibly without any compensating return; for the gardens, if they were to be regarded as part of the frontage tenancies, would be as much depreciated by the noise and dust as the buildings would have been. However, the idea in itself is a fine one, and worth keeping in mind.

Proposed Improvement Scheme for Bolton.

WE publish the ground plan and a view of a fine improvement scheme for Bolton. The book in which this is described and illustrated, and which is entitled "Bolton: A Study in Town-Planning and Civic Art," is written by Mr. Thomas H. Mawson, Hon. A.R.I.B.A., Lecturer on Landscape Design at the University of Liverpool, who, we presume, is responsible for the general lines and idea of the scheme, which is illustrated by some fine drawings by Mr. Robert Atkinson.

The plan, given above, shows the scheme for transforming what we gather to be an existing park into "a civic composition," by forming a level causeway along the front of the park, as the base of the composition, and forming on the higher ground beyond it a culminating architectural feature in the shape of a large building, on classic lines, to be utilised as a museum and art gallery for the town. The perspective view shows the Causeway and its approach, with the Art Gallery in the distance. The scheme is certainly a fine one.

Other suggestions are illustrated in the handsome volume devoted to the subject; among them a view of a proposed new street axially facing the centre of the town hall, and leading up to it. This also looks well in the drawing, and would be an improvement to the city, though we cannot share the enthusiasm of the writer as to "the noble town hall," that structure being, in fact, a very commonplace piece of conventional classic architecture; but such as it is, it forms naturally a centre for a new arrangement of the site around it. The whole publication is exceedingly creditable to its authors.

DRY ROT PREVENTION AND TIMBER SEASONING.

BY JAMES S. HOLLIDAY.

In the course of a lecture on "Timber: its Growth, Disease, Seasoning, and the Principal Uses of its Most Important Kinds," delivered to the Institute of Builders, Koh-i-Noor House, Kingsway, on March 1st, Mr. James S. Holliday, Senior Vice-President, gave some valuable practical hints on the prevention of dry-rot, and also described a process of seasoning which he has successfully employed.

HAVING summarised the natural history of timber, and the defects and diseases to which it is subject, the author continued: But the woodworker is more interested in those diseases which attack converted timber, and of these the most important is dry rot. The spore of fungi germinates on damp wood, provided some alkali is present—such, for instance, as ammonia fumes in stables—then, under the influence of warm still air—i.e., absence of ventilation—its spawn threads spread, not only in all directions through the wood, forming greyish white cords and flat caked mosses of felt on its surface, but even over damp surfaces of brickwork or soil, and thus to previously unaffected timber. The fungus destroys the surface of the timber, lessening its weight, causing it to warp and crack, until at length it crumbles up when dry into a fine powder, or, absorbing any moisture, becomes a soft cheese-like mass.

Imperfectly seasoned timber is most susceptible to dry rot. The fungus can be spread by its spawn, and we are told that this can be carried by the clothes, or even by means of the workmen's saws, to other wood that is sound, if the diseased timber be left near it.

The Prevention of Dry Rot.

On the other hand, dry timber, kept dry, is proof against dry rot, and exposure to really dry air is fatal to this fungus. (If only the ends of properly seasoned beams, which are inserted in brick walls, were to be previously creosoted or treated with some other antiseptic, it would afford a most effective protection against dry rot.) Probably we hear more about dry rot in newly erected buildings now than in former years. It is a defect which has caused a great deal of trouble, and has given rise to much litigation. The author suggests, as a practical builder, that to a certain extent the greater prevalence of the disease may be due to the altered conditions of building. Formerly a reasonable time was allowed for the erection of buildings, whereas in the present day expedition seems to be the essence of most contracts. This means that before the building has had any time to rid itself of the immense amount of water used in its erection, timber (generally selected by the architect for brightness of colour, and consequently of recent importation) is used for the partitions, floors, roof, etc., the ends of which are fixed in and against the walls. A warm, damp atmosphere surrounding the wood—as for instance, under a floor immediately over the ground—and unventilated cellars are favourable to the spread of the disease. The author suggests that no timber should be fixed in a position so that the moisture in and around it cannot be easily evaporated. No wood slips should be built into the top of the concrete without being creosoted, and no boards should be laid directly on the concrete and afterwards covered with linoleum, etc. All the space under wooden floors should be cleared of vegetable or fungoid growth, and covered with concrete, and this should be left as

long as possible. No wooden pegs communicating with the earth beneath should be left in and through the concrete. Inlets should be formed in walls for the introduction of fresh air underneath all ground floors, and also for cross-currents. The space under floors should be cleared of all shavings and pieces of wood.

Antiseptic Treatment of Timber.

Allusions to various substances employed in preserving timber and other vegetable fibres from decay are frequently met in the writings of the ancients. Tar and pitch were used for painting or smearing wood from periods of the most remote antiquity. Greek and Roman authors narrate that the astringent portions of the oil from olives, and also of that from cedar, larch, and juniper, were used for the preservation of articles from decay, or from the attacks of insects. The magnificent statue of Zeus by Phidias was erected in a grove at Olympus where the atmosphere was damp, and the wooden platform upon which it stood was therefore imbued with oil. The famous statue of Diana at Ephesus was of wood, and Pliny states that it was saturated with oil injected into a number of small orifices bored in the woodwork. The same author remarks that wood well rubbed with oil of cedar is proof against woodworm and decay.

Mr. Boulton, in his work on antiseptic treatment of timber, says that not until the eighteenth century can anything beyond the merest trace be detected of serious research into the causes of decomposition. It is stated that during the struggles of Great Britain with the host of her adversaries the prevalence of dry rot in the timbers of the men-of-war vessels assumed the proportions of a national calamity, and that various experiments were tried of injecting resinous vapours, and the salts of copper, iron, zinc, etc.

But it is since the birth and growth of the railway system that antiseptic treatment of timber may be said to have received its most important development. The original stone blocks and other solid supports at first used on the permanent ways were found to be too rigid, and had to be replaced with a more elastic material. Wood sleepers decayed rapidly, and hence a process of antiseptic treatment for prolonging their life had to be considered.

By the year 1838 several systems of antiseptic treatment were before the public, and competing for the favour of engineers, viz., corrosive sublimate introduced by Mr. Kyan; sulphate of copper, introduced by Mr. Lloyd, and heavy oil of tar (afterwards termed "creosote") introduced by Mr. Bethell.

As early as 1756 attempts were made in England and America to inject into or impregnate timber with vegetable tars or with extracts therefrom, but the practical introduction of the process is due to Mr. John Bethell. His celebrated patent, dated July, 1838, does not mention the words "creosote" or "creosoting." It contains a list of no fewer than eighteen various substances, mixtures, or solutions, and

among them a mixture of coal tar and dead oil distilled from coal tar; which is the origin of the so-called "creosoting" process.

Pure creosote is the product of the destructive distillation of wood. Commercial oil of creosote is a dark brown liquid obtained from coal tar, of which it constitutes from 20 per cent. to 30 per cent. It is produced by distillation, and consists of the light and heavy oils of tar, but its composition is very variable.

There are several patent wood preservatives and antiseptics on the market, among which are carbolineum avenarius and "Solignum," for both of which it is claimed that they preserve wood and protect it against fungus, dry-rot, and the ravages of insects and vermin.

Creosoting.—The benefits of creosoting are of a threefold nature—that is to say, three different actions are set up—(1) Physical action. A very greatly increased solidity is obtained by choking the pores, the wood becoming more or less solid blocks. (2) Physiological action. The smell of creosote imparted to the wood prevents germinal life, which is well known to be destructive to timber, being developed within it. (3) Chemical action. The tar acids in the creosote are antiseptic, and also cause some changes in the wood, which are stated to play an important part in the preservation of timber.

Seasoning, Natural and Artificial.

It is generally thought that natural or air seasoning gives the best results, for which purpose the wood is piled in a seasoning yard, protected so far as possible from sun and rain, but with air circulating freely on all sides of each log. Bad ventilating is sure to cause dry rot; stacking timber vertically or at an angle is inclined to produce unequal drying; the planks should be stacked flat or on edge.

Various processes for the artificial seasoning of wood have been practised since time immemorial; the Romans, for instance, having for this purpose resorted to soaking timber or burying it under corn.

Artificial seasoning systems have been adopted by several contractors in London, the object being to make fresh imported timber usable, instead of having to stack it for the long periods required by natural seasoning. One advantage gained by this method is that valuable space may be utilised that would otherwise be occupied by large piles of timber in the process of natural seasoning, and another that the locking-up of capital is avoided.

The author described a method of patent artificial seasoning adopted by his firm, as follows:—A stoving building is erected about 26 ft. by 8 ft. (inside measurements), built in brick and lined with cement, with a flat fireproof roof of concrete, and a pair of teak doors closely fitted at one end. Three openings, 12 ins. in diameter, form ventilators in the roof, in which there are also two small holes for lowering a registering thermometer through. Trolley lines are laid on the floor, so that the timber can be loaded on to the trolleys outside and run into the stove. Under the floor a chamber is formed with an arrangement for superheated steam, which is conducted from an adjacent boiler through a system of pipes to discharge-pipes which distribute the steam evenly in the main chamber. The timber is carefully stacked on the trolley, allowing space all round same.

The trolley is then drawn into the chamber, the doors are secured and the ventilators closed. Steam is then admitted for a certain number of hours, and subsequently superheated steam for a further

number of hours. During the whole process, the temperature must be constantly tested, and regulated to conform to a tabulated list, which, however, varies according to the thickness, kind, and initial state of the timber, and the atmospheric conditions prevailing, all of which factors have to be taken into consideration.

The required temperature (which it may be necessary to raise to 225 deg. Fahr.) must be arrived at gradually, sudden changes being carefully avoided. The temperature can be regulated in various ways, either by slightly reducing or slightly increasing the amount of steam admitted, by cocks on the superheater, or by slightly opening for short periods one or more of the ventilators. With care the desired temperatures at the required periods can be obtained within three or four degrees. The time of steaming varies between thirty and thirty-six hours, during the whole of which supervision is necessary.

When the proceses of steaming and superheated steaming are completed, the supply of steam is shut off, the ventilators

are fully opened, and the fire under the superheater allowed to die out, so that the temperature in the chamber may gradually cool.

Volumes of vapour are at first emitted, but these rapidly diminish, and cease altogether within about twenty-four hours after steam has been shut off. The temperature is then tested, and if it is within about 15 degrees of normal, the doors are slightly opened to assist in ventilating the chamber. The doors, however, are not fully opened before thirty-six hours after steaming, or until the temperature inside the chamber is within five to ten degrees of that outside.

The timber is then removed into sheds, and providing the treatment throughout has been properly carried out, within about fourteen days' time the timber is equivalent to seasoned wood.

Timber is not diminished in bulk or decreased in strength by this process; in fact, the subjoined particulars of tests carried out by the author go to show that if anything the strength of timber is increased by the process.

The theory of the process is that moisture in the timber is expelled by its conversion into a more fluid state, by opening the pores and ducts of the fibres, and allowing steam and then superheated steam to permeate the material, and the heat in the chamber and the timber will assist in expelling the moisture, etc., after the steam is shut off. We find that resin in soft woods flows to a small extent, but this is not of great importance. Also, any shakes that may be in the timber are slightly increased, but the process does not produce shakes.

As a rule we find that the best results are obtained with freshly cut timber. The author believes this system is similar to the artificial systems of seasoning known as Sturtevant's and Erith's.

DOORWAY IN BUSINESS PREMISES, WIGMORE STREET, LONDON, W.
WALTER CAVE, F.R.I.B.A., ARCHITECT.

THE LEGAL POSITION OF
AN ARCHITECT.

BY A LEGAL CONTRIBUTOR.

The position of an architect in relation to a contract is somewhat peculiar. In a sense he acts as the servant of the employer whose interests he is specially retained to guard. The contractor, who knows this, must not, therefore, be quick to accuse him of bias. A contract by which the plaintiff undertook to construct a dock for the defendant company provided that any dispute between the company and the contractor as to the meaning of any part of the contract, or as to the quality or description of the materials to be used in the works, should be referred to the company's engineer as arbitrator. A dispute arose whether the contract required the interior of a certain embankment to be made of stone, or whether rocky marl was allowable, so that, if the contractor, by the direction of the engineer, used stone, he would be entitled to be paid for it as an extra. A correspondence took place between the contractor and the engineer, in which the engineer stated his view to be that the contract bound the contractor to use stone, and that it was not an extra. The company then referred the dispute to the arbitration of the engineer. After this reference, and on the day for which the first appointment had been made, the engineer wrote to the contractor a letter in which he repeated his former view. The plaintiff brought his action to restrain the company from proceeding further with the arbitration. It was held that, considering the position of the engineer, who, as engineer of the company, must necessarily have already expressed an opinion on the point in dispute, his writing after the commencement of the arbitration a letter repeating the same opinion would not disqualify him from acting as arbitrator, unless, on the fair construction of the letter, it appeared that he had made up his mind so as not to be open to change it on argument.

In an action against Leeds Corporation, 1902, a named arbitrator, who was an official of the Leeds Corporation, wrote a letter in which he said that the claim of the contractors against the Corporation was outrageous. The contractors brought an action against the Corporation, which the corporation applied to have stayed pending the arbitration. The contractors opposed this. It was held that the arbitrator was not disqualified. The following passage from the judgment of Lord Collins (then Master of the Rolls) is not unimportant. Dealing generally with the position of an engineer or architect, he said: "The parties have not agreed—that is the plain English of it—for an impartial arbitrator, because the person they have agreed upon as arbitrator is one who, it may be presupposed, may have formed, to the best of his ability, and with all the information that was at hand, an adverse opinion to one of the parties upon the points in dispute."

The mere fact that an engineer holds shares in the company who is employing a contractor does not affect his position, or expose him to a charge of partiality. Where, however, there is some agreement between the engineer and the employer which is likely to prejudice the contractor, the contractor is entitled to know of it.

If an architect's certificate is a condition precedent to the contractor's right to payment, the contractor, on abandoning the contract, is not entitled to payment for work done without producing a certificate of the architect, unless he can show that

the certificate has been collusively withheld. Dealing with the position of a surveyor, Lord Esher said:—"Where a surveyor is put into the position to give a certificate, I do not say that he is an arbitrator, but he is an independent person. His duty is to give the certificate according to his own conscience and according to what he conceives to be the right and truth as to the work done, and for that purpose he has no right to obey any order or any suggestion by these people who are called his masters. For that purpose they are not his masters. He is to do that on his own conscience wholly independent of them, and to act fairly and honestly as between them and the contractor." Care should be taken to make payment contingent not only on the character of the work, but on the character of the machinery supplied for the purpose of fulfilling the contract.

A manufacturer agreed "to provide a fourteen-horse engine, a sixteen-horse boiler, with fittings and everything complete for £260, and to deliver and erect the same to work." It was a further term of the agreement that payment of the last instalment should be made when the purchaser was "satisfied with the work." It was held that these words related to the work of erecting the engine, and not to the price of the engine itself.

As a general rule, the contract provides that the employer shall only be liable to pay for extras ordered by the architect, and included in his certificate. For instance, a clause is generally inserted to the effect that the contractor shall have no claim for extra payment beyond the contract price in respect of any work done by him for the corporation, unless previous to the execution of the alterations he shall have received a written order from the engineer expressly stating that the work is to be the subject of an extra charge, and then only for the amount which the engineer in his final certificate shall certify to be due to the contractor in respect of such alterations and additions. The advisability of having an express provision on this question will be manifest. It may be mentioned that where an architect gives his final certificate in respect of a contract which includes extra work, the final certificate is conclusive, and neither party can raise the question whether or not there was sufficient order in writing. Where the contract contains no special provision for ordering extras, but states that the contractor shall be paid for all extras at the price fixed by the engineer, it seems that the grant of a final certificate in respect of work that includes extras is conclusive. In such a case the engineer has power impliedly to determine what are extras under the contract, and his decision on the point cannot be called in question. A later decision, however, brings out the difference in this respect between a final and a progress certificate. The contract provided that there should be no extras without the engineer's written order. It also provided that no allegation by the contractors of knowledge of or acquiescence in deviations or additions on the part of the employers should be accepted or available as equivalent to the engineer's certificate, or in any way supersede the necessity of such certificate as the sole warrant for deviations or additions. While the work was proceeding the contractors were allowed to erect girders of a heavier weight. The actual weights were entered from time to time in the progress certificates granted by the engineer. When the work was completed, the contractors claimed a sum in excess of the contract price for the extra weight of metal supplied. It was held

that the progress certificates were not written orders, and that the claim was therefore excluded by the contracts.

PICTURE EXHIBITIONS.

The Fine Art Society.

At the rooms of this Society there is on view a collection of landscapes in oil and water-colour by Mr. R. B. Nisbet, which is of more than average excellence. The water-colours are on the whole the best; the three first in the catalogue—"The Lonely Shore," "Breezy Upland," and "A Day in July"—are very fine works in a broad style, the sky in the second-named being especially good. Nos. 51 and 61 show that the artist can treat sea well also. Among the oil-paintings we may direct attention to "Cumulus Cloud," and "Summer Morning in Eyemouth Bay." The water-colours by Mr. E. Wake Cook, in another room, will very likely prove the more popular collection; but, though they contain a great deal of highly finished and delicate workmanship, they are too "pretty" a style for our taste. In the architectural subjects, however, of which there are several, including a view of St. Mark's, the buildings are very well and carefully treated, both as to drawing and colour.

Messrs. Dowdeswell's Gallery.

At this gallery there is a collection of water-colour drawings of "Old-world Gardens," in which also a good many representations of old buildings are included, by Mr. E. Arthur Rowe. Garden scenery in water-colour has become rather a fashion of late, and Mr. Rowe is an accomplished artist in this class of subject; but exhibitions of this kind tend to have rather a sameness about them. The rather grotesque clipped-tree gardens of Leven Hall, well known in pictures, are well represented, and the standard of execution throughout is excellent; but it is a kind of picture one is getting a little tired of. Mr. Eland's water-colour drawings on vellum of heads of "Beautiful Women," in the corridor of the same Gallery, have much charm and variety of character and expression, and have the merit of deserving their title, which is not always the case in exhibitions of this class.

ENGLISH WOODWORK.

In his lecture at Carpenters' Hall, London Wall, an "Joinery in Old London," Mr. Arthur Keen, F.R.I.B.A., pointed out that there were certain arts in which the English had always excelled, and artistic woodwork was one of them. He described the beautiful workmanship which was found in timber-built houses, the roofs of churches, and in panelling. A great part of the secret of such highly decorative work might be found, he said, in the fact that the men who made the wonderful roofs that were to be seen in Suffolk and Somerset, and in other parts of England, had been taught their business as designers, and not merely as workmen. They worked in a traditional way, and did the things which their fathers had taught them, with such improvement as their own skill and imagination led them to. Carpentry as an artistic craft practically died out with the advent of the English Renaissance, as it was called, under Inigo Jones and Wren, and it was worthy of note that of the many churches built in London by Wren, not one of them had an open timber roof.

Entrance Front.

Garden Front

A HOUSE ON THE SURREY HILLS. HAROLD C. TRIMNELL, A.R.I.B.A., ARCHITECT.

HOUSE AT WOLDINGHAM, SURREY. HAROLD C. TRIMNELL, A.R.I.B.A., ARCHITECT.

SOME SURREY HOUSES.

The accompanying illustrations show three houses in Surrey which have recently been erected from designs by Mr. Harold C. Trimnell, A.R.I.B.A.

The house shown on the preceding page occupies a very fine site more than 800 ft. above sea-level. The facing bricks are of a purplish brown colour, with sand-faced Crowborough stocks. The jointing is raked out for a depth of about $\frac{3}{8}$ -in., and left. The timbered portion of the house has the framing of English oak—adzed-faced and left natural—which has toned to a beautiful silver grey in a very short time. The whole of the external joinery is of English oak. The panels between the framing are of cement and sand, 2 ins. thick, and finished with an uneven sand face to within $\frac{1}{8}$ -in. of the face of the timber, and all distempered a cream colour. The roofs are of a dark brown colour, sand faced, and rough in texture. The valleys are worked circular. Internally most of the joinery is of Kauri pine—stained a dark brown and wax polished. A considerable portion of the walls is panelled. Floors are of wood blocks (maple), stained a dark brown colour and polished. The house was only built about two years ago, but already looks as though it had stood a century. The general contractors were Messrs. H. and E. Waters, of Forest Row, Sussex.

The house at Woldingham, of which two views are given above, also occupies an elevated site, commanding extensive views. Bricks are Sussex brindle stocks, of great variety of colour, from a rich red to a purplish brown. The oak timbers are sawn from Sussex oak, and are for the most part 6 ins. thick, varying in width from 7 ins. to 9 ins., and the panels in between are of cement and sand, finished to an uneven face. All the external joinery is of oak, and the windows are lead-glazed with steel casements. Mr. Wm. Tout, of Hendon, London, was the builder.

The house at Kingswood, illustrated on this page, is of similar construction to the others. The roofing tiles are of a most pleasing colour, in a variety of shades, from a red to a dark brown or black. They are from Sussex, and being exceptionally rough in shape and texture, bear an appropriate resemblance to the old make of tile. All external joinery is of oak. The general contractors were Messrs. A. Peskett and Co., of Crawley, Sussex.

OBITUARY.

The Late Mr. Howard Colls.

The late Mr. J. Howard Colls, joint chairman of Messrs. George Trollope and Sons and Colls and Sons (Ltd.), of London, E.C., left estate which has been proved at £419,797 gross. The testator bequeathed: £500 to the Camberwell Provident Dispensary; £300 to the Camberwell and Dulwich Pension Society; £300 to the Builders' Benevolent Institution; £300 to the Builders' Clerks' Benevolent Institution; £200 to the Church Lads' Brigade, Catherine Street, Strand; £200 to the Evelina Hospital for Sick Children. The following bequests are made to employees or former employees of his business: £200 each to H. T. Challacombe (for many years manager of his Dorking business), E. Brooks, and O. Newling. £100 each to T. J. Collins, H. H. Luetchford, and J. J. Wilson. 750 £10 Ord. shares and 50 £10 Pref. shares of Messrs. George Trollope and Sons and Colls and Sons (Ltd.) to Wallace Elliott, a fellow director. The duties payable on the property will amount to about £54,000.

BOOK NOTICES.

Paints for Steel Structures.

The fifth edition, revised, of this breezy little book finds the author more firmly convinced than ever of the soundness of the hypothesis upon which he has based his investigations. That hypothesis is best stated in his own words: "The theory that oil, or the binder, is the life of paint—that is, the thing that makes it wear—is misleading, and has been the cause of most of the blunders and failures with it in the past. An excess of linseed oil in the paint is as much an adulteration of paint as the introduction of useless or harmful pigment. We work upon the hypothesis that the solids are coefficient with the liquids in producing the best materials, and that the secret, if there be any, lies in the proper adjustment or determination of the amount and kind of each needed to produce a perfect product." Elsewhere he quaintly says that "pigment is the objective element and liquid the subjective element in it. The pigment is the male principle; liquid, the female." The book, while written in a decidedly

HOUSE AT KINGSWOOD, SURREY. HAROLD C. TRIMNELL, A.R.I.B.A., ARCHITECT.

entertaining style, and sometimes verging on epigram, is informed with the practical wisdom accumulated or intensified by forty years' practical study, and is well worthy of the careful attention of all who are interested in its subject. A chapter on rust, in which the electrolytic theory is dealt with, is mainly by a professor of chemistry.

Paints for Steel Structures. By Houston Lowe. Fifth Edition, Revised. New York: John Wiley and Sons. London: Chapman and Hall, Ltd. 115 pages, 7½ins. by 5ins.

Well-boring.

With improved systems of boring available, wells as a source of water supply have assumed during recent years very considerable importance, not only in country districts, but in London, where many large firms have found it profitable and convenient to be independent of the Water Board for the water required in many industrial processes. This book deals almost exclusively with deep boring, the shallow dug wells being so subject to pollution and possessing so many other disadvantages as to render them virtually negligible in a modern treatise. A chapter, however, treating of dug wells, affords a useful introduction to the more important systems, British and foreign, which are described in detail. This, the second edition of a very useful book, contains much new matter, including a chapter dealing more particularly with American oil wells, while tables filling about 260 pages give particulars of many wells that have been sunk in this country.

Well-boring for Water, Brine, and Oil. A Manual of Current Practice. By C. Isler. Second Edition, Revised and Enlarged. London: E. and F. N. Spon, 57, Haymarket. Pages iii.—269, 8½ins. by 5½ins., ros. 6d. net.

The Geology of Building Stones.

The technical equipment of the architect is certainly incomplete unless it includes some degree of knowledge of geology. His view of sites and soils must be at least rather more than superficial, and about building stones it behoves him to know a great deal more than the merchant is likely to tell him, or than can be easily gathered by the "street geologist," as (we think) Kingsley termed the student of stone buildings.

In order to acquire sufficient knowledge for his special purpose, however, it is unnecessary for him to become a complete geologist, and therefore his endeavours to dig out from the too ample quarry of the general treatise the comparatively few materials he requires for the small temple of science which is all that he aspires to rear involve the waste of a great deal of time and energy. He will therefore be grateful to Mr. J. Allen Howe for placing in his hands a book that, while it gives him perhaps rather more matter than he is likely to find absolutely necessary to an adequate understanding of the subject from the point of view of practical utility, is nevertheless divested of most things that are clearly extraneous to this issue. The book, in fact, has been prepared mainly with a view to the requirements of students of architecture, and, of course, special attention has been given throughout to the materials found in the British Isles, although there are occasional references to some of the stones of other countries.

Careful descriptions of the various building stones, with indications not only of whence they came, but of where and how, in particularly noteworthy instances, they have been employed, are followed by useful chapters on "The Decay of Building Stone," and "The Testing of Building Stones," and there are appendices describ-

ing the chief granite quarries and giving classified lists of the larger sandstone and limestone quarries and the chief slate quarries, as well as a brief bibliography of useful books on geology. Many useful tables are included, and the maps and other illustrations have the merit of being distinctly useful.

The Geology of Building Stones. By J. Allen Howe, B.Sc., F.G.S., Member of the Committee on Building Stones and Mortar, International Association for the Testing of Materials. London: Edward Arnold. Pages viii.—455, 7½ins. by 5ins., 7s. 6d. net.

IN PARLIAMENT.

(By our own Gallery Representative.)

Rosyth Garden City.

The Lord Advocate has informed Mr. Ponsonby that the Local Government Board for Scotland would not themselves undertake the planning and erection of the residential portion of the naval base at Rosyth in the event of no satisfactory scheme being submitted for erecting a garden city. So far as the Board were concerned every endeavour was being made to secure that a housing scheme should be undertaken forthwith. He added that he was not aware of land being held up with a view to getting higher feu-duties.

Declining Employment in Slate Quarries.

The President of the Board of Trade, replying to a question by Mr. Ellis Davies, stated that the number of persons employed in slate mines and quarries declined from 17,793 in 1900 to 13,168 in 1909, or by 26 per cent. The figures for 1910 were not yet ready. No annual returns of the numbers employed in the building trades were collected, and they must await the results of the approaching census of population to obtain a figure comparable with that for ten years ago.

Royal College of Art.

Mr. Runciman informed Mr. Grant that the Committee appointed to inquire into the working of the Royal College of Art had not yet reported to the Board of Education, but they might be expected to do so shortly.

A Grievance of Scottish Measurers.

Mr. Watt asked the Secretary of State for War how many schedules for the work at Redford, near Edinburgh, were sent out to Scottish measurers; and how many of these were unutilised and the payments made on application forfeited. He also asked whether the right hon. gentleman was aware that the schedules were arranged according to the English system of measuring, and that this fact made it difficult, if not impossible, for Scottish measurers to utilise these schedules; and that Scottish measurers complained that all new work for his department in Scotland was arranged in this way; and would he take steps to have in future the Scottish work of his Department given out in the language of the country?

Mr. Haldane, in reply, said the form of bills of quantities supplied in connection with the tenders for the erection of the barracks at Redford had for many years been in general use for War Department building contracts without question. Quantities were issued to 24 Scottish firms, one Irish, and four English firms, of whom 11 Scottish and two English firms did not eventually tender. The reasons for their not tendering were unknown except in the case of one Scottish firm who gave the form of the bills of quantities as a reason. A representation on the subject was received some weeks afterwards from the Edinburgh Building Trades Association, and was under consideration.

New Post-Office at Newcastle-under-Lyme.

The Postmaster General has informed Mr. Wedgwood that negotiations on the question of the settlement of the building line of the proposed new Post Office at Newcastle-under-Lyme are still proceeding, and until they are approaching completion no date can be given for beginning the work. A period of about 18 months would be required to erect and finish the building.

A Bournemouth Contract.

Mr. Croft having asked whether the new Telephone Exchange at Bournemouth was being contracted for by a Bournemouth firm, having regard to the slackness of the building trade in the town, was informed by Mr. Dudley Ward that tenders were invited for this work by open competition, and the contract was secured by the lowest suitable tenderer, A. J. Colborne, County Road, Swindon.

OUR PLATES.

Mr. L. Holcombe Bucknell's design for a church tower, of which an elevation and a detail drawing are shown in our centre plates, was submitted in one of the Royal Academy competitions. The only conditions prescribed were the height of the cornice and the width of the nave, which, of course, regulate the dimensions of the tower. The introduction of the tripods above the pediment, the figures at the angles, the adaptation of the order beneath the turret, and the general scheme of ornamentation, show considerable originality of conception.

L.C.C. ART SCHOLARSHIPS AND EXHIBITIONS.

The London County Council are issuing a circular with respect to the scholarships they are prepared to award, in connection with both day and evening classes, to day students and artisans. There are (1) Not more than sixty Art Scholarships for full-time day students, thirty of which scholarships are to be allocated in the first instance to persons engaged in artistic crafts; and (2) Not more than 110 Evening Art Exhibitions open to persons engaged in or intending to engage in artistic crafts, forty of which exhibitions are reserved in the first instance for candidates who are less than 18 years old on July 31st, 1911. Free education, and a maintenance grant in accordance with the circumstances of each candidate, but in no case to exceed £50 a year, are implied in the scholarships, which are tenable for one year, with possible extension to two or three years. Application forms may be had from the Education Officer, L.C.C. Education Offices, Victoria Embankment, W.C.

PROFESSOR BERESFORD PITE ON THE ST. PAUL'S BRIDGE.

At the Carpenters' Hall last week, Professor Beresford Pite said that there was only one site upon which the architecture of a noble causeway could be planned, and that was upon the centre of the axis of the Cathedral. London would then be in a position to offer a vision unequalled by the atrium of St. Peter's at Rome, and, he ventured to suggest, passing even the fondest dream of Wren's great imagination. The opportunity had now come to throw across the river a causeway in a position which would dignify the City, glorify the memories of St. Paul's, and crown London with a great architectural achievement that would be well worthy of the metropolis.

SOME ARCHITECTURAL
ASPECTS OF TOWN PLANNING*

The initial movement of revolt against the slum and the unholy aspect of our streets was successfully urged by John Ruskin, Thomas Carlyle, and the small but enthusiastic band of enlightened spirits led by Charles Kingsley and Frederick Denison Maurice, and, later, as far as its town-planning aspect was concerned, by William Morris, whose artistic instincts were severely shocked by the harshness of the modern town, and who was able by the magnetism of his personality to bring to his standard many varied minds who had imbibed the enthusiasm of his teaching. But still nothing definite was done, and it was not until Mr. Ebenezer Howard drew some circles of a cryptographic character, and carried on a curious type of guerilla newspaper war with them, that town planning in its modern sense could be said to have had any existence. Of course, since then the architectural lantern slides of Greece and Rome and Paris, which were previously exhibited for quite other purposes, are now found of equal value in illustrating town planning.

Even at this stage, the measures passed by our Government, excluding some private Bills, dealt with housing of the working classes and some powers under the Public Health Acts. The corrupt Metropolitan Board of Works did a splendid service for the civic planning of London by the carrying-out of the Thames Embankment, which must find a place in any future scheme, and the clearing of many disreputable slums in the route of Charing Cross Road. The London County Council conceived the Kingsway and other improvements, and other authorities imbibed the notion of preserving open spaces in churchyards and elsewhere. Still, nothing of a definite character in relation to town planning was broached. It is curious to note that architectural societies up to this stage did practically nothing in their own interests or to advance those of the art consigned to their care, but occasionally and perfunctorily stepped in, or attempted to step in, when the spadework was done, instead of being among the prime movers and producing and discussing improvement schemes, which were in most cases left to the civil engineer and the estate agent.

At last the Garden City movement was fully in being, and, although it was at first treated as a mere "will o' the wisp" of a few cranks and philanthropists, it gradually took shape as a serious attempt to solve a difficult problem. Developing in a somewhat erratic manner, it nevertheless eventually succeeded in placing town planning on a substantial footing, and in impressing the philosophers of Westminster with a sense of further possibilities under Government inspiration.

The Town Planning Act at length arrived. We instinctively feel that if town planning is to be really successful architecturally, the profession generally must take a closer interest in it. The Ruislip Town Planning Competitions, so admirably brought about by the persistent efforts of Mr. F. N. Elgood, F.R.I.B.A., will undoubtedly remain a monument in the history of the movement. The Ruislip Competition was thoroughly justified by its results, but the author doubted whether town-planning competitions were likely to become general; for if the architects of a district or a suburb co-operate with the

object of pressing the local council into action, a scheme of some kind should take the field, in order that local problems and their solution may assume a definite practical shape. If this be so, competitors in any town-planning competition that may be launched may be greatly handicapped by a lack of that close knowledge of local conditions that a residence within the area concerned alone can give.

An important element in a town-planning scheme is the spirit of its inception. If it is merely economical in its aspect, and a quick return for the capital expended is the dominant aim, the final result of the scheme will be disappointing to all concerned.

Before a local authority actually prepares a town-planning scheme, it must satisfy the Local Government Board that there is a *prima-facie* case for making a scheme (Sec. 54, 2, and Schedule 5), and after making a formal application, must receive an authorisation for them to prepare one. A like authorisation is required to enable a local authority to adopt a scheme proposed by all or any of the owners of any land which may be the subject of a scheme. The putting into operation of Part II. of the Act depends upon the creation of local opinion as to the necessity thereof, and steady pressure must be brought to bear upon local authorities. It is obviously necessary, therefore, to create voluntary groups for the study of local conditions, and that all architectural bodies should co-operate in the preparation of practical schemes.

An initial obstacle in relation to streets is that of advertisement. The architect is anxious that his designs should be as unfettered as possible by existing structures. The client is equally desirous of exhibiting his wealth or his pre-eminence in relation to his neighbours or of advertising the business his building is to house. The commercial aspect of the question is so strong that to force upon the "business man" the practical consideration of what he has hitherto considered an abstraction is a difficult enterprise. Evidently the best means towards its achievement is, as Professor Beresford Pite has pointed out, that more architects should serve on local authorities.

Doubtful as the reception of the issues of town planning are to the public, still more so are they to our profession. The struggle of the individual against the collective interest was never better illustrated. With the proposals of Mr. Paul Waterhouse in relation to city architecture, reformers will ultimately agree. The freedom of the "artist" in our city architecture has had its day; we see its results and deplore them. We see ourselves practically reduced to the position of assistants to a borough architect in that province of our profession. Design, which we have hitherto regarded as peculiarly our own, in addition to the fetters with which Building Acts and local authorities have loaded us, seems a doleful fate even for the most unimportant acolyte in the Temple of Art. Yet it must be admitted that it is a fate we fully deserve; and, furthermore, it would accomplish much in the direction of better architectural education.

To the commonplace that architecture of the best type was produced in the good old days of uncontrolled practice, we must reply that conditions have changed, and the gradual advent of commercialism, which brought the modern architect in its train, has determined the close of that golden period. Art, in individual buildings under such a régime as Mr. Paul Waterhouse has proposed, may suffer in those few isolated cases where the archi-

tecs may be better artists than their official surveillants; but if matters are properly adjusted, the great artists in architecture should not lack complete and even better opportunities to exhibit their skill, as the inartistic client will have less influence on results.

Opinions on this aspect of town planning are greatly at variance in the profession. The initiators of the movement are for co-operation amongst architects, and there are even cries for a benevolent despot. The impatience of the architect to be untrammelled in the exercise of his art, and the indifference of the building owner to the whole question except as regards his insistence on effective advertisement, evidently point to the conclusion that in this matter, as in all others, a compromise must be arrived at if any proposal is to take practical shape. That compromise must involve some restriction upon architects and co-operation amongst them. A general scheme for the architecture of a street must be laid down by architects in the district, and duly imposed by all available means on the authorities; and the first building of artistic distinction nearest the agreed standard must be duly recognised, and form the main lines upon which the future street should be based. Adjoining structures should harmonise in mass and alignment of main lines, the general treatment and detail being left to the architect immediately concerned.

Gothic architecture has been lectured and written to death popularly. We must now endeavour to popularise modern work, point out its object, its interest, and its beauty to the public who build, and who now have no adequate notion of the difference between good and bad work. This has been successfully done in regard to country houses; why may it not be done for the town house, the shop front, and the warehouse?

The author's proposals, briefly summarised, are—To form voluntary groups of students interested in town planning, each group confining its attention to a definite area, and being dominated by the local architectural society or a parent group. The work of these groups would consist in the study of local conditions, and the preparation of a town plan and its popularisation locally, together with constant pressure upon the local authority within and without. The plan agreed upon to form part of any main scheme that would be considered the best by the local architectural society. The latter to endeavour to secure the local co-operation of architects, and also that of any local non-architectural societies likely to assist.

A Parsimonious Proposal.

Gillingham Education Committee being forced by circumstances to propose an addition to the education rate, it is very natural that some means of economising should be sought. Only one proposal having that object, however, was put forward. A member conceived the brilliant idea of reducing the fee of the Borough Surveyor for professional services from 5 per cent. to 2½ per cent., "seeing that he was already paid £26 as a retaining fee." The economist actually found a seconder, but there his success ended, for his ingenious proposal was defeated. Seeing that the estimate for the Borough Surveyor's fees for the ensuing year is said to be £126, their reduction by one-half would hardly have put the committee in a position of affluence; but they may be very willingly credited with a more dignified reason for rejecting so absurd a proposal.

*Summary of a paper read by E. J. Dixon, F.R.I.B.A. at a meeting of the Guild of Architects' Assistants, on March 7th, 1911.

FIRE PREVENTION NOTES.

Fireproofing School Buildings.

The report of the Departmental Committee on the cost of School Buildings contains fewer specific references to the question of fire prevention than the importance of the point would seem to warrant. The direct references to the subject are sparse and casual; but it may be contended, with some degree of force, that the due consideration of fire risk is implied throughout in the search for cheaper materials which was the Committee's chief concern. Fire-risks, however, are not expressly mentioned, as we think they should have been, in the terms of reference: in which case the Committee would not have treated them so lightly as they do, for instance, when they remark that, "The chief objection to wooden buildings is the risk of fire; but in country schools this risk is practically negligible so far as the safety of the scholars is concerned, if the building is on one floor and suitable means of exit to the open air by windows or otherwise from each room are provided; and as such schools would naturally be isolated from surrounding premises, there would be no general danger to the public. It is also possible to reduce this risk by the use of a non-inflammable wall-lining."

Windows as Exits.

In the above-given quotation, the italics, of course, are ours. If it is seriously intended that school windows are to be regarded as exits, they ought, perhaps, to take the form of supplementary doors with glazed upper panels, or some other modification of the so-called French window. If the Committee had any particular system in

mind, it should have been specified for the guidance of those to whom the expression "suitable means of exit to the open air by windows or otherwise" is likely to prove rather mystifying. Some explanation of this cryptic passage seems to be necessary, since it does not seem feasible to credit the Committee with such loose notions as might easily be read into their observation; which might in this way be interpreted to mean that, the school being upon the ground floor, it would, in case of fire, be easy to bundle the youngsters through the windows, especially through casements! which, after all, is perhaps what is intended. But it looks rather primitive.

"No General Danger."

Exception might reasonably be taken to the somewhat cavalier remark, in this same paragraph 57 of the report, that, "as such schools would naturally be isolated from surrounding premises, there would be no general danger to the public." The assumptions strike us as being quite gratuitous, and at the same time quite characteristic of the light-heartedness with which fire-risks are generally regarded, in spite of the many terrible proofs of the folly of harbouring such lax views, and the danger of fostering either a false sense of security, or of confirming the general habit of "trusting to luck." That country schools are "naturally isolated from surrounding premises" is much too large a generalisation; and, in any case, a wooden school well alight during a strong wind must be indeed isolated to be innocent of danger to other buildings. If wooden schools are to be encouraged, it will be necessary, we urge, in the interests of the children—to

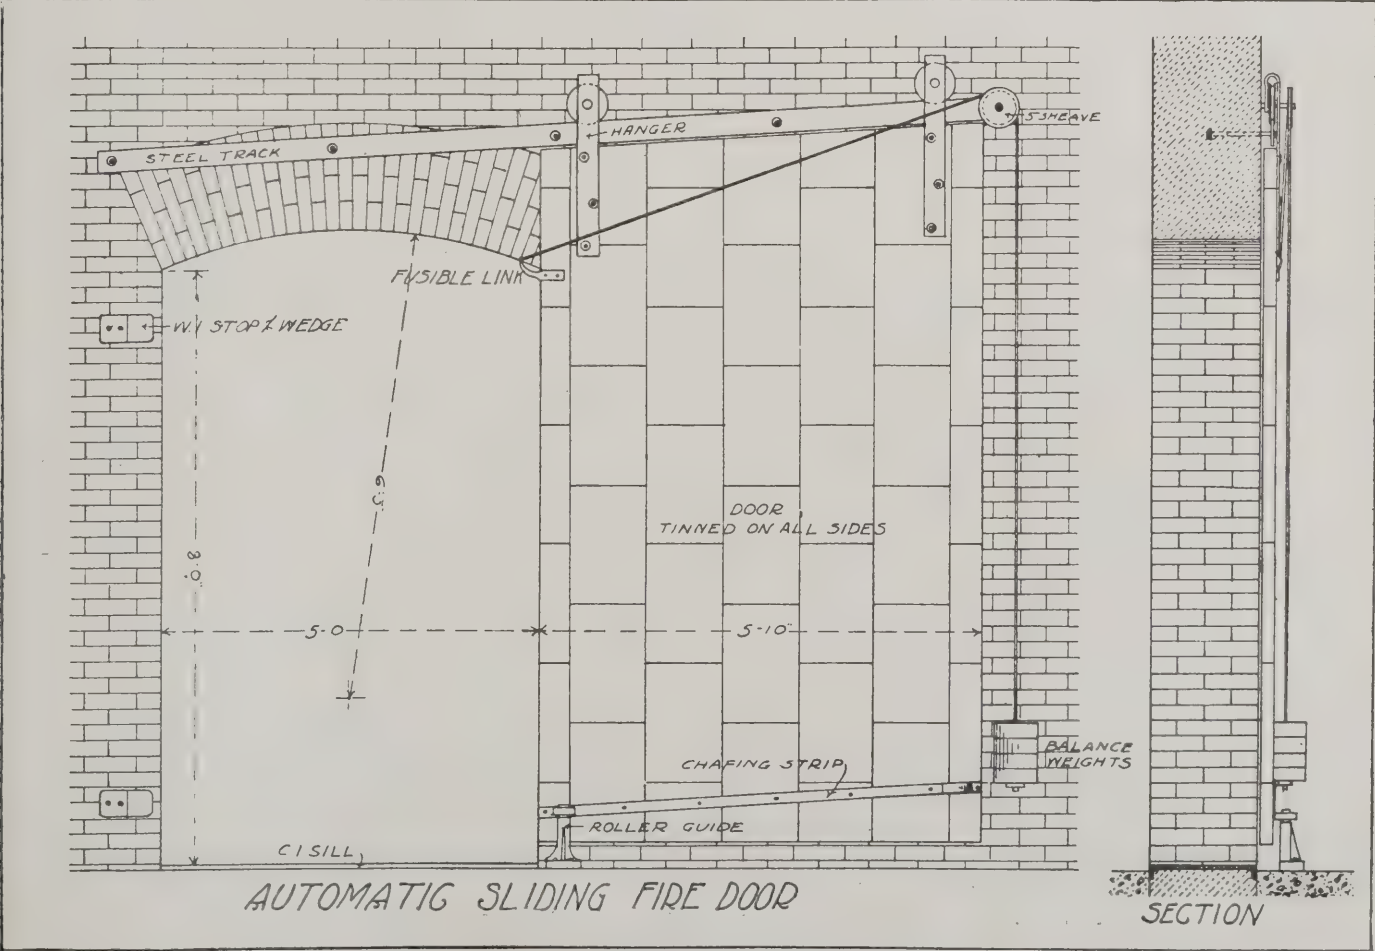

whom we can by no means agree that "this risk is practically negligible"—and of neighbouring properties, that the risks from fire shall be more carefully taken into account than the report encourages any belief that they will be. We commend, however, the (rather half-hearted) suggestion of "a non-inflammable wall-lining."

Casual References.

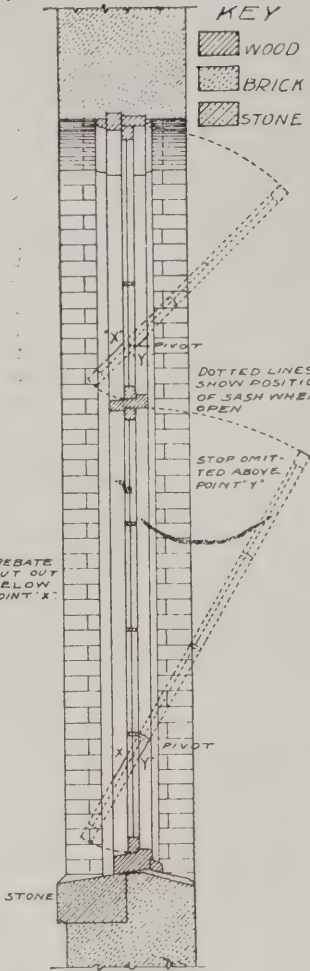

That the witnesses called by the Committee did not manifest greater interest in fireproofing methods than is shown in the report of their evidence is not surprising. Advice as to fire-prevention was not required from them. Consequently the only references they made to the subject were quite casual, vague, and meagre—as that "The corridor would be 10 ft. wide, and of fire-resisting construction," and "There would be no serious risk in case of fire in a small one-storey school so constructed [of timber], as every room could be emptied in a few seconds." Of reinforced concrete slab schools, one witness stated that "Such buildings were accepted by insurance offices as an even safer risk than brick buildings"; another expressed the opinion that in London the precautions against fire in schools had contributed to the increase in the cost of building—from which the inference is only too easy that cheaper schools may mean inadequate precautions against fire.

Some Special Materials.

Mr. W. N. Twelvetrees, in submitting a statement as to the suitability of reinforced concrete for school buildings, claimed that "it is one of the best fire-resisting materials known," and is less susceptible to heat than steel joists; while "for the purpose of staircases there was no saving in the use of reinforced concrete, but the material was better when exposed to fire: it did not

(See "Fire-resisting Doors and Windows for Factories," page 277.)

A STANDARD WAREHOUSE WINDOW.

(See "Fire-resisting Doors and Windows for Factories," page 277.)

splinter and crack like stone, it did not burn like wood, and it did not buckle like steel." It could be wished that there had been many more specific recommendations of special fireproofing materials; but, so far as we are able to see, the only materials of this class that are mentioned are "Expanded Metal," "Fram," "Frazzi," "Hyrib," "Uralite," and "some of the new types of asbestos slating." Too often witnesses had to confess that "they had no knowledge of modern methods and materials"; and the generally conservative character of school builders probably accounts for the shortness of the list of special materials. It could, of course, be greatly extended. There is, indeed, no lack of excellent materials, by the use of which school buildings of light and cheap type can be rendered reasonably immune from attack by fire. It was probably from a knowledge, and perhaps experience, of the extensive use of such materials in other directions, that the President of the Board of Education derived his idea of building cheaper schools. If that is so, there seems good ground for hope that special fireproofing materials will be generally adopted in the construction and protection of the new schools. It only remains for the manufacturers of such special materials to take occasion by the hand by freely bringing them into special prominence.

Picturesque Statistics.

In America they have an alluring way of putting their data picturesquely. Thus it is stated that the total cost of the fires in the United States in 1907 amounted to almost one-half the cost of the new buildings constructed in the country that year; and it is added that "the buildings consumed, if placed on lots of 65 ft. frontage, would line both sides of a street extending from New York to Chicago. A person journeying along this street of desolation would pass in every 1,000 ft. a ruin from which an injured person was taken. At every three-quarters of a mile in this journey he would encounter the charred remains of a human being who had been burned to death." Possibly such appeals may be useful in stimulating persons of sluggish imagination to a sense of the enormity of neglecting their plain duty with regard to the prevention of fires. More to the point from the practical point of view are the dicta on "improved building construction" put forward by Mr. Frank B. Gilbreth, who declares that the lessons from all fires point to these conclusions: No structure of the future should be built of wood. No structure of the future should contain any wood. It has taken, he says, costly lessons to teach us this; but if we have at last learned the lesson, the price we have paid is cheap. This faithful saying may be commended to the very special notice of the Departmental Committee on Cheap Schools.

An Ardent Advocate.

It may be objected, however, that Mr. Gilbreth is an out-and-out advocate of reinforced concrete construction, for which he claims that it affords least cause for fires, least amount of damage to structural parts either by fire or by water, least spread of fire above or around, and that it possesses a number of other virtues which, we fear, would be hotly contested by advocates of other systems. Even Professor Woolson, consulting engineer to the National Board of Fire Underwriters, who is not at all opposed to reinforced concrete construction, said, in discussing Mr. Gil-

breth's paper, that the all-concrete house could not be regarded as "practical from the artistic standpoint"—an unfortunate collocation of terms, which, nevertheless, leaves no doubt as to the meaning. He referred, in particular, to the difficulty of supplying in reinforced concrete the internal decorative features that are possible with woodwork.

The Artistic Interest.

Prof. Woolson measured the woodwork used in a sitting-room and dining-room of a friend's house, which is new and called "fireproof," and was astonished to find that those two rooms contained the equivalent of more than 1,700 sq. ft. of soft, highly inflammable wood. From these measurements it was estimated that the entire ten-storey building contained 16,000 ft. of "kiln-dried, painted and varnished kindling wood." Add the furniture and fittings, and you have the material for a very rapid and very big blaze, from which the inhabitants would be lucky to escape with their lives. No wonder that Prof. Woolson and others are advocating the enacting of laws which will prohibit the erection of such inflammable structures within congested areas. Mr. Gilbreth, replying on the subject of decoration, claimed that concrete decorations could be moulded "rapidly and surely," but did not venture to suggest in what way the undoubted prejudice against them could be removed. It would be an absurd mistake to imitate in concrete the decorative effects that are appropriate to wood-carving. The aim should be to evolve schemes and forms that are entirely suitable to concrete; and this is a subject that as yet has received insufficient study.

Fire-escape Staircases.

A somewhat unusual form of emergency fire-escape was recently under discussion by Richmond Town Council. It was proposed to fix, outside business premises, an iron stairway which would project about 2 ft. 3 ins. over the footway, at some 15 ft. above it. To reach the street level from the stairway, a rope ladder, to be kept always in readiness, would be dropped. The Highway Committee recommended the Council not to raise any objection to the projection of the iron stairway over the public footpath, and the Council consented to the arrangement. Apparently the circumstances are exceptional, as ordinarily it is not necessary for external fire-escape staircases to project over a public footway, but, generally speaking, the design of external fire-escape staircases has not received sufficient attention to redeem them from unsightliness. Surely there is no reason why, being, it is hoped, supremely useful, they should also be supremely hideous, as at least some of them are.

Soot as a Fire Risk.

A recent fire in a London residence was attributed by the firemen to electric-wire fusion, a strained elbow-joint having been found in the steel tubing under the library floor, where the fire had evidently burned fiercely. The joint, however, was probably not strained until the floor gave way during the fire. The builders engaged on the subsequent repairing work have formed a different opinion as to the origin of the outbreak. Removal of the burnt overmantel revealed the existence of several large pockets in which soot could easily accumulate. This would catch fire and smoulder until it reached the oak chimney piece. Several similar cases have come

under the notice of the present writer, who is therefore disposed to believe that, in most cases of fires in dwelling-houses, the flue is the point of origin. The flues may be either badly built or have unsuspectingly fallen into disrepair; or the stove-setter may have ignorantly or carelessly left cavities in which soot accumulates, smoulders, and menaces the safety of the house. A conscientious chimney-sweep will sometimes report the defect; which, however, more often remains undiscovered until, as in the case under notice, the effects of a conflagration reveal it. A lady who has suffered from this cause suggests that, in order to provide against this risk of fire, the prospective tenant should insist on the removal of massive overmantels and new grates, in order that it may be seen that they do not conceal defective work. It is an impossible proceeding; but the fire-brigade authorities, and the insurance corporations, might perhaps press for some efficient method of inspection of this prolific source of outbreaks in dwellings; and perhaps on the use of modern fire-preventing materials in the construction of flues and fireplaces.

FIRE-RESISTING DOORS AND WINDOWS FOR FACTORIES

Typical forms of door and window construction for warehouses, mills, or factories, are shown in the accompanying illustrations. With respect to the horizontally sliding fire-door, it may be mentioned that the approved method of fastening the door-stop to the wall is to run the bolts right through the wall, with a washer and nut at the end. Loosening of the stop by the frequent impact of the door is thus prevented, and the stop therefore retains its function of wedging the closed door tightly to prevent the spread of fire.

The window shown occupies a brick opening 7 ft. 2 ins. by 10 ft. 4½ ins. For a window of the same design for a 6 ft. 2 in. opening, the radius of the arch should be 7 ft. 8 ins., the glass occupying 10 ins. by 17 ins. The necessary details are shown in the illustrations, p. 275, 276.

COMPANY REPORTS.

The 23rd ordinary general meeting of the Patent Victoria Stone Co., Ltd., was held in London on March 4th. The chairman, Mr. W. T. Douglass, M.Inst.C.E., reviewing the business of the company during the past year, said he was glad to be able to report considerable progress, the profit having been £6,168, as against £3,720 for the preceding year. A final dividend of 3½ per cent., making 5½ per cent. for the year, was recommended, and subsequently adopted by the meeting.

The report of Messrs. Stanley Brothers, Ltd., of Nuneaton, brick and tile manufacturers, states, though there was no improvement in the building trades last year, prices remaining at the former low and unprofitable level, the company did very much better than in the previous twelve months, owing to the improved return from its collieries. The trading profit amounted to £25,900, as against £12,900, and although the allowance for depreciation is raised from £12,600 to £15,700, the surplus available is sufficient to cover the debenture interest and leave a balance of £5,600 to be carried forward.

STEEL OFFICE FITTINGS.

On many occasions we have insisted that the grave risks incurred by filling business buildings with woodwork fittings are entirely unnecessary. The modern architect fully realises this danger, but until quite recently he was somewhat at a loss for substitutes for the "kindling wood" which he was compelled, either by the parsimony of his clients or by the deficiency of resources, to adopt, often very regretfully and unwillingly. The latter of these difficulties has been overcome. The architect is no longer under the necessity of specifying woodwork fittings for lack of materials that are much more fire-resisting; nor is his choice confined to the old-fashioned deed-box stamp of article. The deed-box, by the way, may be taken as a somewhat early recognition, by the acute legal mind, of the principle that is only just now beginning to dawn on business men in other directions—that of storing important documents (or, for that matter, any other kind of inflammable goods)—in receptacles that will not easily take fire. The old style of deed-box, however, although it represents a step in the right direction, falls very far short of the high degree of efficiency that has been now attained. For instance, the boxes usually stood on wooden shelves. Within recent years considerable attention has been given to the production of fire-resisting fittings for banks, libraries, and business offices. Several such systems have been described and illustrated in this journal, and we now illustrate the steel-fittings system that has been elaborated, appropriately enough, by Milner's Safe

Co., Ltd., 28, Finsbury Pavement. It is also in accordance with the fitness of things that this system is being widely adopted in insurance offices, as well as in banks, and—where, from the point of view of fire risk, it is even more urgently required—in large drapery and other establishments, for the storage of highly inflammable goods. From the illustrations it is apparent that these fittings are extremely neat, clean, and businesslike. As compared with woodwork fittings, they effect considerable economy in space that, in a place of business, is very valuable, not to say precious, in all three dimensions. The material being, of course, non-absorbent as well as non-inflammable, admits of cleanliness being more easily maintained, and in greater degree than is possible with woodwork; and the advantages of steelwork fittings are altogether so obvious that they are certain to be adopted where business organisation and fire prevention are accredited with their true value and importance.

All kinds of office fittings and furniture are now manufactured in steel by the Milner Safe Co.; cabinets for all purposes, and even office desks and tables being easily adapted to construction in this fire-resisting manner. Pressed sheet steel, 1-16th of an inch thick, is the material employed, either riveted or screwed in an angle-iron frame. The cabinets for garments, examples of which are illustrated, being composed of separate members, ensure the restriction of a fire, should it occur, to a small space, which could easily and rapidly be dealt with. Each cabinet has a series of small ventilation holes in the bottom.

SOCIETIES' MEETINGS.

LIVERPOOL ARCHITECTURAL
SOCIETY.

*Mr. Ernest Newton on Domestic
Architecture.*

"Domestic Architecture" was the subject of an interesting paper read by Mr. Ernest Newton, A.R.A., F.R.I.B.A., at last week's meeting of the Liverpool Architectural Society. Mr. Arnold Thornely presided.

The lecturer said that the past thirty or forty years had seen an extraordinary activity in domestic architecture, more especially in England, but it was impossible, at present, to reduce this manifestation of development to any sort of order, or to be sure where it was leading us. Personal predilection was their only guide. One man was attracted by the stately ordered architecture of the seventeenth and eighteenth centuries; others sought their inspiration from earlier times; some went in for form, others for colour and texture and the skilful or playful manipulation of materials. Again, they had men whose dogma was "straightforward, commonsense building"; and others who threw off the shackles both of old work and commonsense, and deliberately used forms of no known, or even guessed at, parentage. He would be a rash man who would pass judgment on any of these schools. It was all very bewildering; but the lecturer thought there was one clear thread amidst the tangle, and that was—they were all very much in earnest. Everyone was making his contribution in his own way, and so

STEEL LOCKERS, UNION BANK OF SCOTLAND, CORNHILL, LONDON.

long as their work was really their best, and done with real conviction, they could leave the future to straighten out the tangle. It had been remarked more than once that the French system of training architects might be good for the production of monumental architecture, but that the French people could not build country houses. He believed the French could do what they liked, but the set in France was more towards town architecture, and their domestic work in towns was proof enough that their training was as efficient for domestic as for monumental work.

Mr. Newton was warmly thanked for his lecture, on the motion of Mr. Edmund Kirby, seconded by Mr. W. E. Willink, and supported by Mr. T. E. Eccles

R.I.B.A.

Cost of Alterations to Premises: New Fellows.

At the business meeting of the Royal Institute of British Architects held on February 27th, the president (Mr. Leonard Stokes) said that the cost of acquiring, altering, and refitting the Institute premises in Conduit Street, and buying the Architectural Union Company's shares, had amounted in round figures to £30,800. The sale of the Institute investments had realised £21,143, and an overdraft of £7,000 at the bank was desired in consequence. In reply to a question by Mr. Woodward, the president detailed the expenditure as follows:—(1) £10,000 for Messrs. Knight, Frank and Rutley's interest in the premises; (2) £13,000 for buying up the Architectural Union Company's shares; (3) £7,500 for alterations.

At the same meeting Messrs. H. E. Budden (Sydney), A. E. Corbett (Manchester), A. E. Hughes (London), and Reginald G. Kirkby (Huddersfield) were elected Fellows; Messrs. B. C. E. Bayley and J. H. Gray Associates; and Sir Richard Paget an Hon. Associate.

EDINBURGH ARCHITECTURAL ASSOCIATION.

Scotland and the Town Planning Act.

At the meeting of the Edinburgh Architectural Association held on March 1st, Mr. J. A. Williamson, A.R.I.B.A., read a paper entitled, "Notes on the Recent International Town Planning Conference."

London, said Mr. Williamson, had been referred to by Mr. W. E. Riley as furnishing an impressive summary of the evils resulting from an incapacity to appreciate future growth and development in a city. The London County Council, up to December, 1909, had carried out 133 improvements at a cost of 8½ millions sterling. It agreed to contribute £1,455,120 towards the cost of 486 local improvements. The Council's predecessors, between 1855 and 1889, expended more than 11 millions sterling in constructing new and widening old thoroughfares. Notwithstanding these enormous sums, no satisfactory and commensurate results were possible. It was estimated that in 1931 the population of Greater London would almost reach the colossal figure of eleven millions. The Town Planning Act would therefore have accomplished some good if it only forced on the public notice the urgency for development to proceed on rational lines, with due foresight and provision for the inevitable necessities of the future. Two extremes were mentioned which the town development should take. These should be either solid continuous rings, or the growth of numerous detached townlets, spreading from a centre, such as the existing villages

on the outskirts of the town. Developing the city on the principle of grouping the buildings in certain parts, and leaving adequate open spaces around each group, was recommended as the right course. The lecturer contended that the new Act was unfortunately too English in intent and application. Custom had decreed a place for tenements in the economy of Scottish towns, and it was important that the question of their continuance should be debated and determined as a preliminary to any town planning scheme, as not only was the general lay-out of internal areas affected, but the widths also of main and subsidiary roads. Edinburgh, containing nearly 12,000 acres, was said to have 50 per cent. of its area in open spaces and public parks, with an average density of 31 persons to the acre. In this respect Edinburgh might be regarded as approaching the ideal of a garden city were it not for isolated cases, where the actual density ran up to 500 and 600 per acre. The lecturer concluded by emphasising the need for shrewd anticipation of development in the immediate preparation of a town plan.

The members of the Edinburgh Architectural Association paid a visit recently to the General Post Office, Edinburgh, which has been extended. The party were conducted over the building by Mr. A. R. Myres, principal assistant architect, H.M. Office of Works. The extension, which has been carried out under the direction of Mr. W. T. Oldrieve, principal architect, H.M. Office of Works, and will, with furnishing, etc., cost about £65,000.

consists of a seven-storey block erected at the east wing, next Low Calton, and the heightening of the main building. In the new building at Low Calton the basement and first floors will be used as stores for the telegraph engineers, while the upper floors will be occupied as offices for the use of the superintending engineer and staff, parcel and letter sorting-rooms, and retiring-rooms, etc., for the sorters and postmen. The parcel work will be carried on in this building, and as ample accommodation is provided, it will be unnecessary at the Christmas season to utilise the building at Roseburn, which for some years has been made use of to relieve the pressure. In the addition to the main building a large new staff dining-room and kitchen and offices for the accountant and secretary will be provided.

Subsequently a visit was paid to the Edinburgh College of Art, Mr. F. Morley Fletcher, the director, conducting the party over the building. The elementary modelling house, painters' and decorators' section of workshops, and the rooms for modelling, carving, architectural design, and painting from life were visited.

SOCIETY OF ENGINEERS.

Petrol Air-Gas as an Illuminant.

Mr. E. Scott-Snell read, on Monday, March 6th, before the Society of Engineers, a paper on "Petrol Air-gas." Some general remarks on the subject of the paper were followed by a discussion of the most suitable proportions of air and

FIRE-RESISTING STEEL DRAWERS.

FIRE-RESISTING STEEL FITTINGS IN AN INSURANCE OFFICE.

petrol and the constitution of petrols used for lighting purposes. Reference was made to experiments indicating the appropriate mixture necessary for obtaining complete combustion and the limit of combustibility. The laws of evaporation were stated in their relation to the subject, a number of formulæ being given and illustrated by vapour-pressure curves. The author then dealt with the stability of mixtures and the possibility of condensation, and showed that a rich mixture, if not too rich, is free from danger of explosion, giving an experimental proof. The advantages of a self-burning mixture were pointed out. The author showed that a comparison with other illuminants based on "price per cubic feet" must be entirely misleading, a comparison with coal-gas and acetylene being made on the basis of candles per cubic foot of gas. Various types of machines for generating petrol air-gas were described, and reference was made to some difficulties of design. In conclusion, it was pointed out that there was no more satisfactory illuminant than petrol air-gas, but that care should be exercised to select a well-designed plant, which would not need constant attention and readjustment.

JUNIOR INSTITUTION OF ENGINEERS

Mr. S. Bylander on the Royal Automobile Club Building.

At the last meeting of this Institution, held at the Royal United Service Institution, Whitehall, it was announced that the vacancies caused by the death of Mr. Nisbet had been filled by the appointment of Mr. B. E. Dunbar Kilburn as chairman, Mr. Percy L. Young as vice-chair-

man, and Mr. Reginald Krall as member of Council.

The meeting was a combined meeting with the Architectural Association, to assist in the discussion of a paper on the architectural and engineering features of the Royal Automobile Club Building, which was read by Mr. S. Bylander, the engineer (vice-chairman of the Institution).

In the first part of the paper the author dealt with the points of architectural interest in connection with the façade, east and west entrances, and the interior of the building, including entrance hall, elliptical vestibule, east and west corridors, main staircase, etc., passing on to the features appertaining to the first and second floors, and the basement floor, including swimming bath, Turkish bath, etc.

In describing the engineering features of the building, the author pointed out that skeleton framing or cage construction had been adopted as far as was consistent with economy. Preliminary drawings and calculations were made to ascertain the cheapest and best type of construction, consistent with the architectural requirements. Two sets of calculations were made for the steelwork, one approximate, in connection with the skeleton plans, and the other accurate and final for the working drawings. An elaborate system of marking the different steel pieces was adopted for the purpose of speed and accurate erection.

The paper was very fully illustrated by an appendix of twenty-four plates, some of them reductions of the working drawings. The architects for the building are Messrs. Mewès and Davis and Mr. E. Keynes Purchase, referring to whose work the author said that architecturally the club must take an important position among the many fine buildings in Pall Mall.

An interesting discussion followed, in which the Chairman, Mr. Gerald C. Horsley, Vice-President of the Architectural Association, and Messrs. J. H. Pearson, C. G. Gage, P. L. Young, A. G. Young, R. Marshall, W. A. Tookey, and E. J. Daniell took part.

MANCHESTER SOCIETY OF ARCHITECTS.

The Architect's Use of a Library.

At the meeting of the Manchester Society of Architects held on Wednesday last, Mr. J. H. Sellars read a paper on "The Architect's use of a Library." To some people, said Mr. Sellars, a library was dull and uninspiring; to architects it could be a great inspiration and help. There was no better relaxation than to turn from the drawing-board to one's books, which would point out the true, if narrow, path.

It was doubtful whether the old architects understood the history of art as we did to-day. If Wren could have studied the folios of Greek work, we might have seen St. Stephen's, Walbrook, with the mouldings as refined and the ornament as delicate as Greek work. Knowledge of history impressed upon us the fact that great styles were based on reason and logical construction, and that buildings to be considered great must fulfil their purpose. To gain a comprehensive knowledge of the history of architecture it was necessary to be familiar with the history of the people, their religion, and their commerce. Wide reading would bring us to this knowledge, and would aid us in the formation of an artistic character and a power of æsthetic reasoning. Architects should strive after culture in its true

NEWS ITEMS.

Enlargement of Fleet Street Post Office.

It has been decided to rebuild and enlarge the sub-post-office in Fleet Street, opposite Fetter Lane.

* * *

The Mall Archway.

Arrangements are to be made to erect a brick casing wall at the Charing Cross entrance to the Mall when the buildings in Spring Gardens and Charing Cross are demolished.

* * *

A Mission Church.

For the City of London School Mission a church is proposed to be built from designs by Mr. H. P. Burke Downing, F.R.I.B.A., at a cost of about £9,000. Accommodation for 832 worshippers will be provided.

* * *

New Lifeboat House for Peterhead.

At Peterhead a new house for a motor lifeboat is to be built, at a cost of £2,600. The architect is Mr. W. T. Douglas, of Westminster, and the contractors are Messrs. Scott, Marshall and Co., of Edinburgh.

* * *

Doubts About Canonbury Tower.

No tablet is to be placed on Canonbury Tower to commemorate the reputed residence there of Oliver Goldsmith, for the reason that the Local Government Committee doubts the authenticity of the statements of local historians as to such residence.

* * *

Contract for Selby Abbey Reconstruction.

The tender of Messrs. Bowman and Sons, of Stamford, amounting to £8,000, has been accepted for the work in connection with the rebuilding of the south transept of Selby Abbey. Messrs. J. D. Oldrid Scott and Son are the architects.

* * *

Southend Workhouse Extension.

Plans are to be prepared for a new block of forty-eight beds at the workhouse at Southend, half to be built at once, and the rest when occasion demands. The guardians are also to proceed with the building of a new quarter for the nurses. The cost of the proposed scheme is estimated at £10,000.

* * *

Change of Partnership.

Messrs. Rickman and Burr, surveyors, 5, Queen Street, Bloomsbury, W.C., announce that Mr. Rickman has decided to retire from practice, without severing the friendship which has continued during their business connection of the last forty years. The firm will continue to carry on business under the style of E. J. Burr and Son at the above address.

* * *

Proposed Restoration of Linlithgow Palace.

At the recent annual general meeting of the Glasgow Institute of Architects (Mr. John B. Wilson, F.R.I.B.A., presiding), the proposed Scottish National Memorial to King Edward was considered, and a unanimous opinion was given in favour of the restoration of Linlithgow Palace, in preference to any other of the proposed schemes.

* * *

Liverpool Street Arcade.

Liverpool Street is to have an arcade. In connection with the reconstruction of Liverpool Street Underground Station, formerly known as Bishopsgate Street

Station, the old arched roof is being replaced by a steel and concrete floor at a lower level, on which a one-storeyed building, comprising some twenty-five shops in the form of an arcade, from Liverpool Street to Broad Street, together with tea-rooms will be erected. To provide entrances to the arcade, some shops will be demolished in Liverpool Street and Broad Street.

New Buildings for Kingsway.

It is stated that the Government intend to follow the erection of the new building for the Public Trustee's Department in Kingsway by providing accommodation on a site immediately adjoining for the Lunacy Commissioners, who have for long past been inadequately housed in hired offices in Victoria Street. Both buildings will have imposing frontages, and will cover an area of 13,335 ft. super. The Commissioners of Works are to pay for the sites a perpetual rent charge of £3,200 a year.

* * *

A Shock to Aesthetic Paris.

The public mind, or, rather, that portion which concerns itself with the beauty of Paris, is very greatly exercised at present with certain additions which are being made, and others which are threatened, to the justly admired façades in the Rue de Castiglione and the Rue de Rivoli. These streets — planned under the first Napoleon, and carried out on his architects' plans between 1807 and 1835 — preserve an absolute regularity in their arcades, balconies, storeys, architecture, and even in their system of lighting, all of which are preserved by legal decrees. By some oversight, however, these decrees did not extend specifically to the roofs, which, hidden behind a parapet, were considered to be tacitly included. But the needs of certain hotel-keepers who require further bedroom accommodation has caused them to add two or more storeys, and these so disfigure the skyline, and are so likely to be followed by others that æsthetic Parisians are up in arms, and the matter will be brought before the courts, and ultimately before the Legislature.

sense; not artificial or superficial accomplishment, but the natural and inevitable process by which a man came into possession of his own nature, and into a real and fruitful relation with the world about him; not the possession of information, but the absorption of knowledge such as would enable them to reject the untruthful and to pass by the trimmings of styles that are dead. Too many books had been written on taste, "What is Art," and so forth. They were unprofitable and wearisome, and often the work of amateurs who did not practise and were unable to put themselves into the position of the worker, and who read into buildings motives and causes which seldom had any existence.

[GLASGOW TECHNICAL COLLEGE.

French Masonry.

At a meeting of the Glasgow Technical College Architectural Craftsmen's Society, held in the College on March 3rd, Mr. Bowman, president, in the chair, Mr. James S. Boyd, Licentiate R.I.B.A., read a paper entitled "A Study of French Architectural Masonry." At the outset, the lecturer, in explaining why he advocated the study of French masonry, pointed out that the examples of scientific masonry were so numerous in Paris and its vicinity as to encourage anyone to make a comprehensive study. The organisation of the workmen in a first-class mason's yard in Paris was described and compared with similar yards in this country. Over 100 photographic and telephotographic slides showing the construction of domes, vaults, bridges, etc., in Paris, Versailles, and Rouen were exhibited. The speaker stated that boldness in French masonry construction was traditional, just as caution or lack of boldness was traditional in British work. In concluding, the opinion was expressed that architects in this country should be trained to master thoroughly the practical applications of geometry to building work, so that they — as master-craftsmen — may assist the actual workman in the solving of any difficult constructive problem that may occur in the carrying out of the design of the master-mind.

LEICESTER SOCIETY OF ARCHITECTS

The Influence of Tradition and Fashion on Modern Architecture.

At last week's meeting of the Leicester Society of Architects, Mr. Edward Turner gave an address on "The Influence of Tradition and Fashion on Modern Architecture." He said that a great many architects were far more apt to be influenced by both tradition and fashion than to turn out anything that might be called really original. He maintained, however, that this was no detriment, for the study of the architecture of the past was a necessity for modern architects, and was helpful to them. He instanced St. George's Hall, Liverpool, and Westminster Cathedral as two of the finest buildings in the country in which the study of architecture of the past had helped the architect. The only danger lay in copying. What they needed was so to study tradition that they became imbued with its spirit. With regard to fashion, the speaker said people had always been followers of fashion in every age, and the speculative builder took great care to provide houses exactly alike, so that Mrs. "So-and-So" could have the same as her neighbour. Examples of the "beauty" of such a scheme were to be seen in all modern suburbs.

REORGANISATION OF THE L.C.C. ARCHITECT'S DEPARTMENT.

The London County Council decided that, as from January 1st, 1910, the educational architectural work should be placed under the charge of the architect, and that the staff of the Department of the Architect (Education) should be transferred to the Architect's Department. The Establishment Committee has now considered and reported upon proposals for the reorganisation of the amalgamated departments on a permanent basis. The Establishment Committee say that they are satisfied that the complete fusion of the departments is in the best interests of the Council, and that, with further modifications, which time and experience may suggest, the new arrangement will result in an organisation combining efficiency with economy. The main feature of the organisation of the combined departments is the division into three separate branches as follows—(1) administrative division; (2) constructional division, other than schools; and (3) schools division. The necessary reorganisation, though affecting the department as a whole in a considerable degree, necessarily has its greatest effect in connection with the last-named division. When the departments were fused there was a considerable quantity of arrears of educational work, but by unity of administration and correlation of similar work these arrears have been to a large extent overtaken.

There is, however, the Establishment Committee point out, a large amount of current work which constantly tends to increase, and they are satisfied that it is necessary for the fixed staff of the department to be increased in numbers and strengthened in status in order to secure an efficient organisation, not only to deal with a further acceleration of work, but to secure the maintenance of that acceleration in an increased programme.

It is pointed out that in the Architect's Department there is a large and varying number of technical officers who form what is called the unestablished staff. For some time it has been recognised that it is desirable to place on the permanent staff a certain proportion of the unestablished staff, and this Committee are advised that the incorporation of the staff of the Architect's (Education) with the Architect's Department makes it imperative that action in this direction should not be delayed any longer. Out of a total staff of 183 assistants (excluding clerks of works and messengers) engaged on schools work, there are only 61 assistants on the established staff; and taking the whole of the department (excluding clerks of works and messengers) there are 204 established and 281 unestablished assistants. This proportion of unestablished staff is unnecessarily large, and the permanent requirements of the department call for a higher proportion of permanent officers. It was therefore suggested that fifteen unestablished assistants—none of whom had had less than seven years' service, and seven of whom had been employed for more than fifteen years—should be placed on the established staff at salaries approximating to their weekly pay. All these assistants are capable and fully qualified technical men.

It was also proposed that the thirteen positions on the established staff of district clerk of works should be abolished as vacancies occur, and that the work which such clerks of works are called upon to

perform should in future be undertaken by technical officers of first-class rank. Having regard to the nature of the duties entrusted to these officers, which are largely administrative, as opposed to the duties usually performed by clerks of works, the Committee think that the adoption of this course will be in the interests of efficiency. The proposed reorganisation is thus tabulated:—

Proposed positions.	Proposed Salaries.	
	On 1st April, 1911.	Ultimate.
	£ s.	£ s.
1 Chief assistant architect...	900 0	1,000 0
1 Divisional architect for schools ...	800 0	800 0
1 Assistant divisional architect for schools ...	575 0	600 0
7 Assistant architects ...	3,875 0	3,900 0
2 Measuring surveyors ...	1,200 0	1,200 0
9 Principal assistants ...	3,975 0	4,150 0
20 Senior assistants ...	7,000 0	7,400 0
73 1st class assistants ...	18,030 0	21,900 0
69 2nd class assistants ...	11,357 10	13,800 0
9 Minor establishment assistants, class I. ...	1,033 10	1,404 0
21 Minor establishment assistants, class II. ...	1,826 10	2,184 0
6 Non-classified assistants...	1,540 0	1,540 0
12 Clerks of works ...	2,950 0	2,950 0
1 Assistant clerk of works...	150 0	150 0
2 Boiler inspectors ...	300 0	300 0
2 Clerks of works on weekly wages ...	399 2	399 2
1 Jobbing Carpenter on weekly wages ...	109 4	109 4
2 Messengers, class I. ...	208 0	208 0
1 Messenger, class II. ...	78 0	91 0
2 Messenger, class III. ...	127 8	156 0
242	56,434 4	64,241 0

The net result of the staff rearrangements is to add a divisional architect, one assistant divisional architect, one principal assistant, five senior assistants, eight assistants in the first class, four assistants in the second class, and on the other hand to reduce the establishment by one assistant architect, one clerk of works, two non-classified assistants, and one minor establishment assistant.

Mr. J. Briggs, the chief assistant architect, acts for the architect with full responsibility, whenever necessity requires, in supervising both the administrative and constructional work of the department. Owing to the fusion of the departments, additional responsibilities have devolved on Mr. Briggs, and the Committee think that a salary of £1,000 a year is not inappropriate for the second-in-charge of a department of the size and importance of the Architect's Department. This salary for the deputy of a head of a department obtains in several of the large departments in the Council's service, and the architect has spoken in the highest terms of the value of Mr. Briggs's services to the Council. The Committee recommend (1) That the salary (£800) of Mr. J. Briggs, chief assistant architect, be increased to £850 a year as from 1st April, 1910, rising by annual increments of £50 to £1,000 a year.

It was recommended that Mr. R. Robertson, assistant architect, be promoted to be divisional architect for schools, and that his salary (£600) be increased to £800 a year as from April 1st, 1910. It was also suggested that Mr. H. R. Perry, assistant architect (schools) should be styled "assistant divisional architect for schools," at a salary of £550 a year, rising to £600 a year. Further recommendations were the promotion of Mr. W. Hynam (£450), principal assistant, to be assistant architect at a commencing salary of £475 a year, rising a year later to £500; the promotion of Mr. F. H. Peacock and Mr. F. W. Harrison, senior assistants, at £400 a year each, to principal assistants at £400 rising by £25 a year to £450; and a number of minor promotions were recommended.

ENQUIRIES ANSWERED.

Fair Wear and Tear Covenant.

A. G. C. (DEVONSHIRE) writes: "Under a fair wear and tear covenant, is an outgoing tenant liable for ceilings darkened by lamps or gas brackets?"

—This question hardly comes within our scope, but we should have but little hesitation in answering it offhand in the affirmative, a "fair-wear-and-tear" covenant being, as a rule, construed somewhat stringently as against the tenant.

Wanted, a Heat-proof Floor.

THERMOS (LANCS.) is building a two-storey building. The ground floor is to be a bakery, and the first floor is to be used as a public hall. Suggestions (especially from experience) would be appreciated as to the nature, construction, and cost of the floor of the hall to prevent the heat getting through.

Red Spots on Paint.

A (N.W.) writes: "On the front of an old brick building in a sheltered position I have formed panels of Keene's cement and sand and finished with neat Keene's. I have given five coats of paint (white to cream), followed by two of varnish. The first coat of paint was put on two days after the panels were finished, and the second coat of varnish one month after the first coat. Six months later red spots began to appear, and now, ten months from the time of painting, the whole of one panel, 6 ft. by 3 ft., and 1½ in. thick, is covered with red spots about the size of a shilling, and the other panels are following suit. Will you kindly tell me the cause and remedy?"

—Everything appears to point to some vegetable growth which was not removed before the cement was applied, and it would work through the coats of paint in course of time. We suggest that you scrape off a little of the red spots; and place the paint in a bottle of ammoniated alcohol. If the red is of vegetable origin it will decompose; if you add acetic acid the colour will come back. If, however, the red spots should be rust, which we very much doubt, the ammonia will not affect it. You might try touching up the spots with weak ammoniated alcohol, which may have the desired effect, washing off with clean cold water.

A.S.J.

Architect and a Building Contract.

A correspondent writes:—"Upon completion of a certain contract where some extras were involved I rendered a complete account to the architect, but in response the latter has issued a final certificate stating in his opinion the amount due, which sum is far and unreasonably below my claim. I have requested from him a statement in explanation of his certificate showing how he arrives at his decision, but he has refused to grant any such particulars or explanation."

Our correspondent wishes to know whether he has any legal remedy and what steps he ought to take to secure just treatment.

—In response to our request for a copy of the contract, he says the architect is the only person who possesses a copy, and wishes to know whether a copy of the agreement can be demanded from the architect, and whether the builder has legally the right to hold a copy of the agreement as well as the architect.

Our correspondent is recommended to employ a solicitor, who should have his attention called to the case of *R. W. Blackwell and Co. v. the Corporation of*

Derby (in the Court of Appeal) where the contract contained a clause giving the borough engineer every conceivable power and making any award by him final and binding on both parties. In the course of giving judgment Lord Justice Fletcher Moulton expressed the view that any case of this kind must be decided on the facts, and that, where the nature of the dispute arising from the facts which were subsequent to the contract was such that the tribunal (set up by the contract, in this case the borough engineer) was not likely to be able to deal impartially with the dispute, it was open to the Court, and would usually be its duty, to refuse to enforce the arbitration clause. Lord Justice Buckley concurred, and remarked that the matter to be determined was whether the contractual referee was an unreasonable person. The worst possible referee on the question of unreasonable conduct was the person who was accused of being unreasonable. It was not human nature to suppose that he could properly determine whether he himself was an unreasonable person.

Probably a letter from the solicitor informing the architect of the untenable position he has assumed would result in a change of attitude; if it did not, legal proceedings will have to be taken. As regards a copy of the contract, it can hardly be refused, but the builder might be required to pay for the making of it.

It is in matters like this that the advantage of having a printed form of contract such as that issued by the R.I.B.A. at a cost of 1s. becomes apparent, as it is easy to have it signed in counterpart when the contract is signed; and in any case its provisions are perfectly familiar. Attention may also be drawn to the well-known case of *Robins v. Goddard*, where the effect of the decision is that where an arbitration clause exists there is no finality about an architect's certificate even though it purports to be a final one.

Our correspondent should not have any great difficulty in securing a reference to this dispute to an independent arbitrator, but he would probably have succeeded in obtaining redress at the outset if he had been a member of an organised body such as the National Federation of Building Trades Employers.

THE TIMBER OF BRITISH COLUMBIA.

The merchantable woods of British Columbia are Douglas fir, white or silver fir, hemlock or Alaska pine, larch, red cedar, yellow cedar or cypress, Engelmann spruce, Menzies spruce or Sitka spruce, and white pine. A useful description of these timbers is given in "The Timber of British Columbia (Bulletin No. III.), compiled by Mr. C. F. Pretty for "Pretty's Timber Exchange," Vancouver (London agents, British Canadian Securities, Ltd., Pinner's Hall, E.C.).

Douglas Fir.

Fir is the most plentiful wood in the south-western part of the Province of Vancouver. Douglas or yellow fir grows to a great size and height. The tallest Douglas fir of the coast of which there is record was 380 ft., which is also the maximum height recorded for redwood. Trees 15 ft. in diameter have been observed, and some of the largest Douglas firs of the coast forests have scaled as much as 60,000 board feet. Whole forests are found in which the trees average 250 ft. in height and 5 ft. in diameter. Such trees are usually clear for a long way up the stem, since their rapid growth in competition for

light does not permit the formation of large branches, and such small ones as are formed soon die under the shade of the crowns and are broken off; but the average and most cheaply logged areas are those that are covered by timber which runs from three to five feet on the stump and from 75 ft. to 150 ft. to first limb. These trees, if they hold their size evenly, cut enormous quantities of lumber, and many have been seen that would cut 25,000 ft. of merchantable timber. Fir has great strength, and is especially valuable for structural purposes. It is used largely in shipbuilding, bridge work, wharves and railway cars. It finishes and stains well, and has a grain almost equal to oak.

White or Silver Fir.

This wood is much coarser in grain than the Douglas fir, and is not suitable for outside work, but is used for ship-lap, lumber or any inside work where it is not subject to the weather. Although there are some large tracts of silver fir, it is not a very widely distributed wood in British Columbia. The trees, when found, however, are usually tall and clean, and average about three feet on the stump.

Hemlock or Alaska Pine.

This tree grows through the whole Province, usually mixed with other timber. It differs greatly from the Eastern hemlock of the Rockies, growing tall and clear of limbs, and averages about two and a half feet on the stump, although it is possible to find many much larger specimens. The grain is much more compact than the Eastern hemlock, and is very sound, having no shakes as the Eastern hemlock has, and it withstands the elements much better. In dry climates it will outlast many other woods at present in use. In appearance it stands between spruce and yellow pine, and often experts are deceived. It takes a fine, hard finish when dry.

Larch.

This tree, which is very plentiful in the higher altitudes and northern parts of British Columbia, resembles the Eastern balsam, but grows much larger and taller, averaging about two and a half feet on the stump. It resembles British Columbia hemlock in grain, is tough and durable, and can be used for structural purposes, in fact is suitable for almost any kind of building. It stains well, and takes a beautiful finish.

Giant Arbor Vitæ, Red Cedar.

The giant arbor vitæ is next to the Douglas fir in importance in British Columbia, where it attains its greatest size on Vancouver Island, along the coast and along the lower parts of the rivers of the Coast Range. It is rarely found in the dry interior of British Columbia, but it is abundant in the river valleys on the slopes of the Selkirk and Coast ranges. Though seldom found more than 150 ft. in height, in circumference it rivals the Douglas fir, trees of from 8 to 10 ft. in diameter not being rare, and they are occasionally found much larger. It is chiefly used for the manufacture of shingles, for which purpose it is unequalled by any other wood. Formerly the shingles were made by hand, the wood splitting easily, but improved machinery has so lowered the cost of production that comparatively few hand-made shingles are now used, though they are still in demand when a shingle of superior quality is desired. The wood of this tree takes a very brilliant polish, and is well adapted for interior finishing of all kinds. So great is the variety of shading in the colour of the wood that a large house may be finished in it without two rooms being alike. In British Columbia it enters largely

into the manufacture of doors and cabinet work of all kinds. Like all cedars, it lasts well underground, and on this account it is much used in the form of telegraph poles and fence posts.

Yellow Cedar, Yellow Cypress.

The yellow cypress is not nearly so abundant in British Columbia as the arbor vitæ, nor is its circumference so great. Its height is about the same as the arbor vitæ—150 ft.—and its average diameter is about four feet, though occasional trees attain five feet. The yellow cypress is confined to southern parts of British Columbia; it is not found at sea level, the finest trees growing at an altitude of from 1,000 to 2,500 ft. Though valuable for many purposes, the wood of the yellow cypress is not extensively used at present, the cost of transportation to the seaboard being too great. On the Queen Charlotte Islands it descends to the coast. When lower levels have been cleared of other trees, the yellow cypress will be utilised. This wood is very durable, and on account of its pungent odour it is credited with resisting the teredo. Its grain is very close, and as the wood takes a very high polish it is greatly valued for interior finishing and for the manufacture of furniture. It commands a higher price than either Douglas fir or arbor vitæ. On account of its liability to shrink, lengthwise as well as laterally, it requires to be well seasoned before use.

Engelmann Spruce.

This characteristic spruce of the Rocky and Selkirk Mountains is the most useful tree growing in the interior of British Columbia, and is there largely used in bridge and trestle work and for heavy construction work generally. In the valley of the Columbia it is often more than 150 ft. in height and 4 ft. in diameter. The wood is very like that of the black and white spruces, and may be used for the same purposes. This was the chief wood used in the construction of the Canadian Pacific Railway from the Rocky Mountains westward.

Menzies Spruce, Sitka Spruce.

This spruce grows chiefly in the immediate vicinity of the coast, ranging in British Columbia from the International Boundary north to Alaska. Though averaging less in diameter than the Douglas fir, occasional trees of great size are found. Those cut for lumber are, however, seldom more than 5 or 6 ft. in diameter. No other tree on the West Coast is used for such varied purposes, and as it is easily worked up by machinery there is a great demand for it in the manufacture of doors, window sashes, boxes, shelving and interior finishing. The wood is very white, is elastic, and bends with the grain without splitting, so that it is much used in boat-building, staves, etc. It resists decay for a long time, and, like the Douglas fir, is not attacked by insects. The chief value of the Sitka spruce will, however, in the near future, be in the manufacture of pulp. As the shrinkage is usually very great, it is generally kiln-dried before using, or kept stored away until it is thoroughly seasoned.

White Pine.

White pine is not very plentiful in British Columbia. Still there is considerable distributed among other woods, especially in the higher altitudes. It is identical with the Eastern white pine, but grows large and tall, and is sound and clean. It is valuable for any purpose that soft woods can be used for.

While the above-mentioned are the principal woods, there are many others of considerable value.

THE ORDERS AND MODERN BUILDINGS.

"An interesting discussion ensued on the paper read on March 6th before the Architectural Association by Mr. A. R. Jemmett, F.R.I.B.A. (see the Journal of March 5th, page 224), Mr. R. Phene Spiers contributing some valuable notes."

Some Notes by Mr. R. Phene Spiers.

The subject which was suggested to Mr. Jemmett to take up is much too vast to be discussed properly in one evening, and I propose to take up two points only in his paper. First, the dictum attributed to M. Louis Duc: "There is no architect without the Orders." I do not know where he said it, or what the preamble was, but I do not think that the students in England recognise the extent to which the study of the Greek and Roman Orders is pursued in the Ecole des Beaux-Arts. It used to be the custom, when I was studying in Paris in 1860, and it may still be continued, to give once a year what was called the "*Projet de l'Ordre*." This consisted of some subject for design in which one or more of the Classic Orders was to be applied. I say, "or more," because I recollect that the first subject I had to take up was a design for two bays of the courtyard of some Government offices, in which the superposition of the Doric and Ionic Orders with arcades between was to be embodied. Two months were given to work out the design, and I remember that I made myself acquainted with every example known, from the Theatre of Marcellus and the Colosseum to the numerous courtyards in the Italian palaces. The second subject, in the following year, was for an Odéon or Music Hall, with a peristyle round the exterior and a portico on the front to be of the Greek Ionic order. Here, again, I made a profound study of every Greek temple of which diagrams had been published; and as parts of the building rose above the peristyle and portico, these had to be designed in accordance with the style, which necessitated a thorough research into the various accessory buildings of the sacred enclosure, in order to find *motifs* for my design. It was probably to this course of study that M. Duc referred; and his view was, that a student should make himself the master of the Orders instead of remaining their slave.

The other point in Mr. Jemmett's paper is the reference made to the use of the colossal order rising through two or more floors. Generally speaking, the problem is solved by rustication the masonry of the ground storey, so that it makes a solid and suitable base to carry the large order above; if, crowning this, there is either an attic storey, or, as in Somerset House, a lofty balustrade, the relative heights of these three subdivisions give scale one to the other. One of the chief difficulties to be met with in this combination is the undue height of the entablature of the great order, which should be a quarter of the height of the complete scheme—viz., including capital and base. This great height tends to interfere with the lintel of the second or upper floor window and the sill of the attic window, and there are some buildings in London in which the architect has cut through the architrave with a window, and utilised the frieze as the supporting member of the cornice. This is a mistake; the architrave is the correct supporting member, but the frieze is only a decorative feature which might be omitted.

There was no frieze in the Ionic temples of Ionia, but when the Attic Greeks introduced the order into the Erechtheion they omitted the Ionic dentil bed-mould, and in order to get sufficient height for the ceiling beams of the East and North porticoes

were obliged to introduce a frieze, and this was necessarily carried round the whole temple: they omitted the frieze, however, in the entablature of the caryatid portico. The omission of a frieze when a colossal order is employed would lessen by about one-third the depth of the entablature.

There is still another treatment of the subject which was employed by Mr. R. Norman Shaw in the New Zealand Chambers in Leadenhall Street. Now Mr. Norman Shaw is the grand master of fenestration; and when he was called in to design this building, he recognised at once that in this comparatively narrow street more light could be obtained up and down the street than from the side opposite; he therefore applied for permission to project some oriel bow-windows. He was told, however, this was not possible, but if he liked to set back his front then he could project his bow-windows. This his clients objected to, so he asked what proportion of the whole front would have to be in solid brickwork. I think he was told one-third. This he contrived in four great piers and a part of the ground storey, and between these piers and about 2 ft to 2 ft. 6 ins. back—viz., the required projection for his bow-windows—he sketched in these features and took his design again to the Metropolitan Board of Works, and obtained permission, provided the woodwork of the windows was kept $4\frac{1}{2}$ ins. behind the front of the piers. This regulation is now given up, but in 1873, when this building was erected, all window-frames had to be set back $4\frac{1}{2}$ ins. and in recessed jambs, because sometimes when, in a Queen Anne building, where the frames were flush with the wall, if a fire took place they fell out and injured the firemen. These various enquiries led to the design of the New Zealand Chambers, which are not only the best lighted premises in the city, but the grandest and most impressive in design of any of Mr. Norman Shaw's works. These great piers rising from the ground to the main cornice have the same dignified aspect as that which is given by the employment of the colossal order, but at all events in this case, Mr. Jemmett's statement that it results in a "pleasing but most misleading effect," certainly does not apply. I would suggest, therefore, that our students should make a point of going down to Leadenhall Street, now that I have told the story of the conception of these New Zealand Chambers, to see how certain regulations and requirements may sometimes result, in the hands of a master, to an original treatment of the whole subject. As a matter of fact, I believe the bow-windows are not in wood but in iron, so there is no fear of their falling on anybody's head.

Mr. Alan Potter, proposing a vote of thanks, said that in two of the Roman orders, Doric and Ionic, he thought the arch should be included, because the entablature was designed in conjunction with the arch. He hardly agreed with Mr. Jemmett that the application of the orders was necessarily the method for emphasising particular parts of a design. The order, to his mind, was not a structural feature, but simply the clothing of a structural element in a beautiful design. The function of the order was the expression of the structure; and if we confined ourselves to Classic architecture we must retain the order.

Mr. Herbert Hall said Mr. Jemmett had laid particular emphasis on the functional aspect of the order; but the most interesting point was its application to modern buildings. The difference in its modern application was admirably illustrated in the new addition to the British Museum (which might in its character be considered ancient), and another building in Aldwych by the same architect. In this latter building the order was used in what might accurately be termed a modern way. The order was rendered in a diversity of methods; and in a jeweller's shop in Oxford Street it assumed very attenuated proportions. The order, to be used satisfactorily, continued the speaker, should fulfil a useful function combined with a definite expression. It was very satisfying to know that somewhere in a building a real column was acting in organic relationship with the building, and that the pilasters (the indiscriminate use of which the speaker had previously deplored) were simply the expression of a point, or were acting as an architectural chain. Columns also usefully emphasised the entrance to a building, as in the case of Waring's building in Oxford Street. Unless the order could be used in a noble way it had better be left out. Mr. Burnet was showing how one could use the order very well indeed, and Mr. Bolton had used the large scale order very successfully in Ingram House. He saw no objection to the large external order running through several floors; in a sense it was the expression of the lift shooting up the interior.

Mr. Curtis Green said they should be masters of the order—not its slaves. The speaker then referred to the observation attributed to M. Duc, that "there is no architect without the orders." Mr. Jemmett explained that this was a misprint, and should read, "there is no architecture without the orders." Mr. Green replied that he preferred the misprint. Continuing, the speaker said that all the men who were doing good work to-day were masters of the orders. Should we ever have an architectural dictator he should lay it down that no three-quarter columns and no pilasters should be used for ten years.

Mr. A. G. R. Mackenzie advocated the use of large orders in the way they had been so successfully used in Oxford Street. For himself, he thought that the column could be used very effectively as a screen; and the speaker concluded with a reference to the treatment in this manner of one elevation of the Piccadilly Hotel.

Mr. Jones said it seemed to him that the whole subject of town design resolved into a question of fenestration. The grouping of windows with piers between should be the customary means of expression, and the order should be regarded as a very rich and precious member to be reserved for some important part. By the repetition of the order *ad nauseam* they lost the sense of rarity. One façade to the Woods and Forests building, in Whitehall, was designed without introducing the order. The main front contained Ionic columns, obviously for the purpose of carrying on the lines of the Banqueting Hall and the War Office; but he could not help thinking that the design would have been finer had the columns been omitted. Huge columns necessitated the overhanging cornice, and very deeply recessed portions between to get the effects of light and shade. The gigantic column was, he thought, unsuitable to London.

Mr. V. R. Talvalker having spoken,

Mr. Alan L. Snow made some observations upon the original function of the

order, comparing it with its modern use in buildings where the entablature seldom formed the final and finishing member.

Mr. D. A. Forster thought it fallacious to trouble about expression at the expense of soundness of design.

Mr. Arthur Keen said he often wondered what the Greeks would think if they could see how we used the order. The method was not really a sound and creditable one. The screen at Hyde Park Corner was used in a proper way. Mr. Jemmett had treated the order from the æsthetic standpoint; and this was really the only way in which it could be accepted in modern use.

Mr. Jemmett, replying, said that to advocate expression and not structure was perhaps not quite orthodox sentiment. They might put up a structure, but it would not necessarily be architecture. It began to be architecture when it expressed emotion and human feeling. The flutings on columns and the triglyphs in the frieze above, although not in themselves structural, intensified the impression of structural purpose. If expression were not the thing they were aiming at there was no need for architects. He agreed that fenestration was highly important. They did not want elaborate repetition, nor should undue prominence be given to unimportant commercial buildings. The order should be kept for public buildings or for the intersection of street fronts. Concluding, Mr. Jemmett said, with reference to a remark by Mr. Hall, that the introduction of columns as a means of emphasising the entrance to a building was quite legitimate; but to say that an opening was too square or too wide, and to introduce columns merely to make a more pleasant proportion, was quite wrong. The danger he saw in it was that it might lead to putting orders in the wrong place. The purpose of the architect was impersonal.

COMPETITIONS.

Palais de Justice, Athens.

The time for sending in designs for the above has been extended from August 8th-21st to September 12th-25th.

Penrith Secondary School.

The awards in this competition are as follows:—1, Messrs. Harrison and Ash, Pilgrim Street, Newcastle; 2, Mr. W. P. Schofield, Leeds; 3, Mr. Theo. Halliday, Manchester. There was a very large number of competitors, about 200 architects having applied for particulars. The school will probably cost about £12,000.

Marylebone Town Hall.

In their report to the Marylebone Borough Council, the Town Hall Committee state that, considering that the Council might wish to choose their own assessor, and also to have the final choice of the designs submitted, they placed the matter before the President of the R.I.B.A., with the result that it has been agreed (subject, presumably, to the approval of the Borough Council) that the President shall nominate three gentlemen from whom one may be chosen as assessor, with whom two members of the committee should be associated in the selection of the designs.

Pavilion for Consumptives at Royal Hospital for Incurables, Donnybrook.

The awards of the assessor (Mr. A. William West) in this competition are as follows: 1, Messrs. Kaye Parry and Ross, 48, Kildare Street; 2, Messrs. Walter Doolin and Butler, 12, Dawson Street; 3, Mr. George P. Sheridan, 1, Suffolk Street, Dublin. The Committee recorded on the minutes their appreciation of the great

trouble and interest taken by the several competitors in connection with the preparation of the plans. The assessor considered that the plans were all well-drawn, clear, and definite, and showed considerable skill and ability on the part of the designers; also that the information accompanying the plans was full, and gave evidence of much care having been devoted to the matter.

LIST OF COMPETITIONS OPEN.

MARCH 21. ELEMENTARY SCHOOL, LUTON.—Luton Education Committee invite architects willing to compete in a limited competition for a new elementary school. Six architects will be chosen to compete, and those who are unsuccessful will receive an honorarium of £5 5s. each. Apply Secretary of Education, Town Hall, Luton.

MARCH 31. CHURCH, NEW CUMNOCK.—Particulars in our issue of March 7.

(R.I.B.A. have requested Members and Licentiates not to take part, see p. 260, March 8.)

APRIL 1. MUNICIPAL OFFICES FOR COVENTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 1. "OWEN JONES" COMPETITION FOR WALL-PAPER DESIGNS, etc. Designs to be submitted to the Board of Education by April 1. The competition is open to students in schools of design. Six prizes are awarded by the Society of Arts, John Street, Adelphi.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

MAY 5. STREET IMPROVEMENT, SWANSEA.—Architects are invited to submit competitive designs and estimates for Castle Street improvement. Block plan and particulars on receipt of one guinea deposit, to be returned to competitors who fulfil the conditions. Premiums: Not exceeding £250 for the architect appointed to prepare the working drawings; £50 to author of design placed second. Mr. S. S. Reay, F.R.I.B.A., has been appointed assessor. Apply Town Clerk, Guildhall, Swansea.

MAY 15. COURT HOUSE, ETC., CHESTERFIELD.—Derbyshire Standing Joint Committee invite designs from architects practising in Derbyshire, for a new court-house and lock-up, to cost £8,000. Assessor, Mr. Frank Baggallay, F.R.I.B.A. Apply to Mr. George C. Copstick, L.R.I.B.A., County Offices, Derby. Deposit of three guineas for particulars.

COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C., invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

CORRESPONDENCE.

Responsibility for Dry Rot.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Referring to your editorial of February 22nd, and the letter of Mr. Geo. Macfarlane in your issue of March 8th, may I remind those concerned that the Form of Contract issued by the R.I.B.A. in agreement with the Institute of Builders and the National Federation of Building Trades Employers contains the following (clause 11): "The Clerk of Works shall be considered to act solely as inspector and under the Architect, and the Contractor shall afford him every facility for examining the works and materials."

If clerks of works were strictly limited by the architect and builder to acting solely as inspectors, probably we should hear a great deal less of their iniquities than we do.

That it is not so is evident from the numerous complaints which reach the ears of those who frequent the meetings of builders, from the formal representations which have been made to public departments, and from the case which elicited your comment and this correspondence.

Why is the clerk of works allowed thus to usurp functions which do not appertain to his true position? Probably because he is the man-on-the-spot. The result seems to be that the architect relies on him for relief from many questions of detail, and has a natural tendency, if the clerk of works shows capability, to leave the general overseeing of the works to him. This in its turn makes it necessary to pass instructions through him to the contractor's foreman, and to rely upon his reports and back up his decisions. In large concerns like Government Departments, this tendency becomes very marked, and the clerk of works becomes in fact a resident architect.

The contractor's foreman naturally defers to the clerk of works as the architect's *alter ego*, and is liable either to become subservient to him, acquire an undue influence over him, or else be at loggerheads with him. Under such adverse influences, the works are apt to be either unduly prolonged or unduly expensive, or seriously defective, while the actual parties to the contract, viz, the building owner and the building contractor, have usually to pay the piper between them.

The clerk of works, according to his previous training, character, and capabilities, is: sometimes a loyal help to all parties concerned; sometimes a punctilious stickler for the letter of the specification, regardless of its spirit; sometimes a self-seeker who makes himself disagreeable with the sole object of either exalting his position or lining his pocket; sometimes one who boasts of the architects he has ruled or overruled, and the contractors he has bled or ruined, or, according to him, made; but whatever he is, probably the last thing he will admit is that his function is "to act solely as inspector."

It certainly is high time that architects and builders, jointly and severally, decided to adhere strictly in practice to the definition of the functions of clerks of works contained in Clause 11 of the R.I.B.A. Form. These imply that the clerk of works shall not give any orders on the works, but merely report in writing his observations to the architect; that all communications shall go to the builder through the architect and not through the clerk of works and the foreman. A. G. WHITE.

TRADE AND CRAFT.

"Sideroleum" and "Stoniflex." ■ ■ ■

"Sideroleum" is a wood preservative, which, applied to new wood used for building operations, for fences, poultry-runs, cycle and tool sheds, garages, etc., has the effect of hardening the wood so as to make it impervious to moisture, and proof against attacks of vermin, dry rot, fungus, and insects. With regard to dry rot, it is claimed that this wood preservative will not only prevent that disease, but arrest its progress. It is easy to apply, and penetrates the pores of the wood, so that the effect is not simply to give the wood a hard coating, but to alter the character of the wood itself. Moreover, as it imparts a fine nut-brown or green colour (according to choice), "Sideroleum" dispenses with paint, the preserving and staining of the wood being completed in one operation. It is stated that a gallon is sufficient to treat 220 square feet of timber.

"Stoniflex" roofing felt has been upon the market for some years. It presents an entirely weather-proof surface, and does not require annual coating. It contains no coal tar or pitch, but is rubber-like and very densely compressed. It does not become sticky, but remains pliable—neither cracking nor perishing with exposure to heat or cold. In fact, it appears to oxidise, and is practically everlasting. The proprietors recommend it as an ideal roofing for fowl-houses, hutches, kennels and sheds.

Samples of "Sideroleum" and "Stoniflex" (the latter in three thicknesses—weighing per roll 15 yards long and 1 yard wide, (a) 50 lb., (b) 35 lb., and (c) 24 lb.—and (c) lining felt) may be obtained from ironmongers and hardware stores, or in response to a postcard addressed to the manufacturers, D. Anderson and Son, Ltd., Lagan Works, Belfast, or Roach Road Works, Old Ford, London, E.

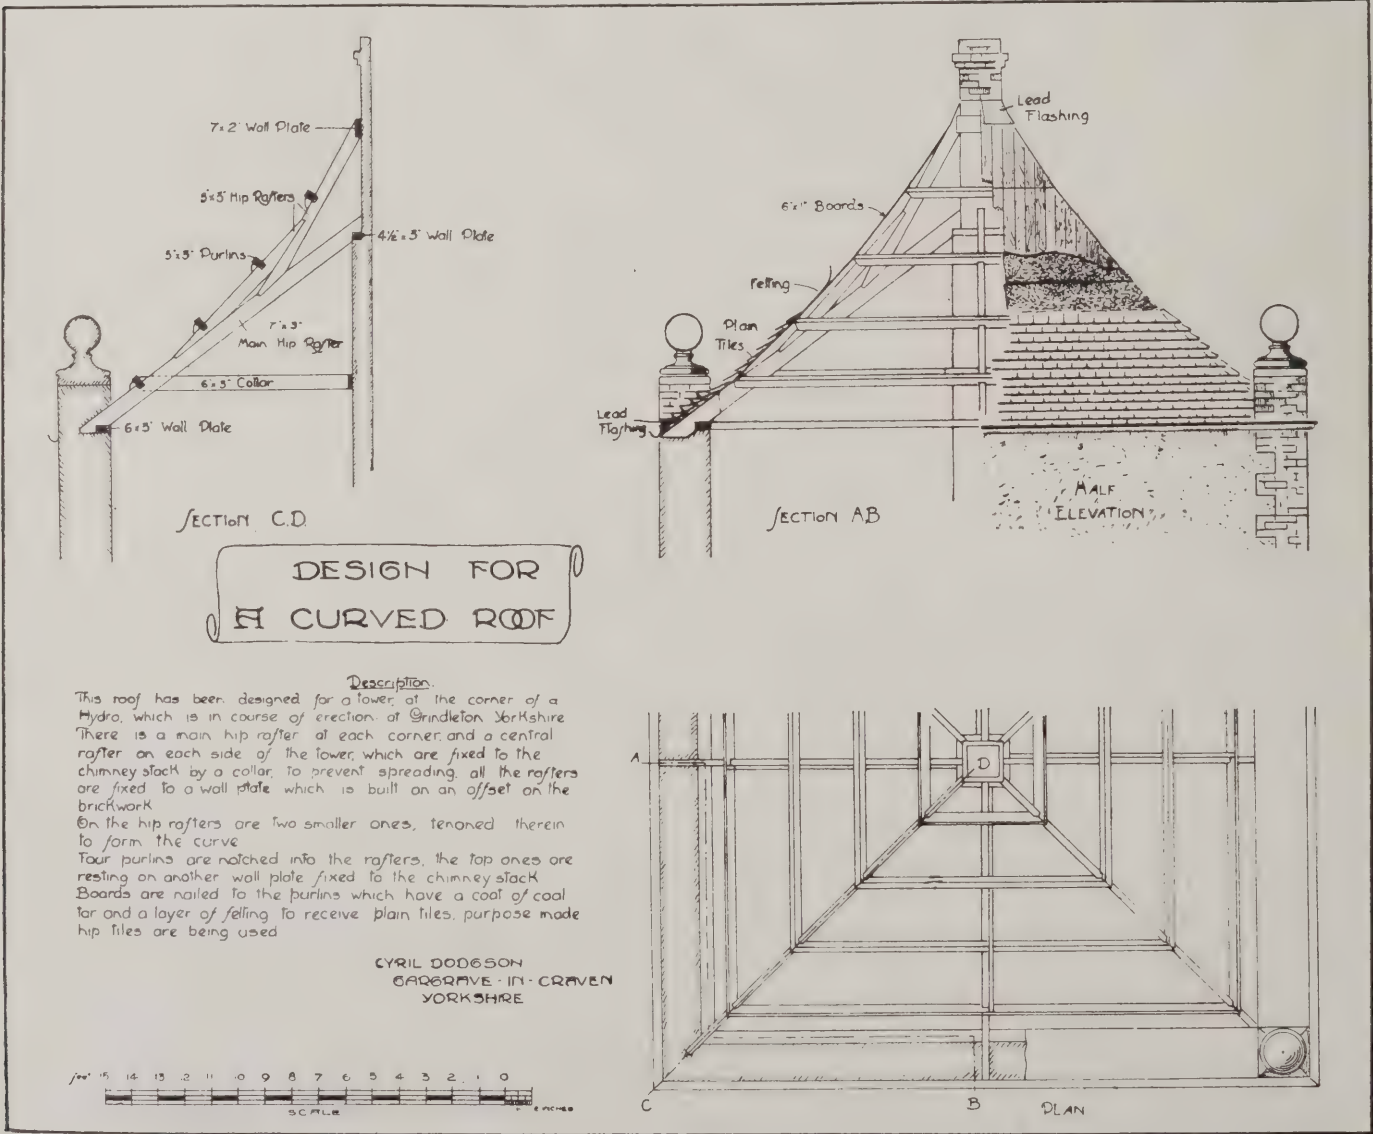

Fuller's Patent Scaffolding.

Briefly described, Fuller's patent scaffolding, which has recently attracted considerable attention, as seen on important building operations in London, consists of ordinary 2-in. by 7-in. battens mortised at regular intervals, scaffold boards being used as ledgers to carry the ordinary putlogs and boards. The scaffolding is tied in to the ledger by means of a patent putlog tie-iron, and by wedging the putlog in the ordinary way to the brickwork of the building. A bracket specially suitable for inside work and adjustable to any position supports the scaffold boards.

The advantages claimed for the system are as follows: In erecting or striking, one scaffolder and one labourer can do the work of six men using ordinary scaffold poles and cords. No bracing is necessary; and when once erected the scaffold requires no supervision, the common trouble of cords slacking in wet weather being, of course, entirely absent. The standards being in short lengths, a large number

A NEW HEATING AND DOMESTIC ENGINEERS' ASSOCIATION.

At a meeting of the engineering employers in the above-named trades held at Birmingham on March 3rd, it was resolved to form a branch association of the National Association of Master Heating and Domestic Engineers, to cover Birmingham and the three counties of Warwick, Stafford, and Worcester. An organising committee was elected, consisting of Mr. John P. Achurch (Parker, Winder and Achurch, Ltd.), Charles Barter (Benjamin Parker, Ltd.), G. N. Guest (Hollings and Guest, Ltd.), J. Jackson (J. Jackson and Co.), and W. L. White, 82, Upper Trinity Street Birmingham, the last-named being convener. The new branch association is to promote and forward the interests of heating and domestic engineers in the area above-named, and to be affiliated with the National Association, whose head-quarters are at 12, Great James Street, Bedford Row, London, W.C. (Mr. H. B. Watt, secretary).

Goldwin Smith Hall, Cornell University, Ithaca, N.Y.

French and English Cathedral Architecture.

It has become the fashion with American writers on architecture to speak of French Gothic, especially as illustrated in the cathedrals, as the only true Gothic architecture, English Gothic being either entirely ignored as not worth consideration, or referred to only in contemptuous terms, and illustrated

with details carefully selected to show some weak point which is represented as typical of the English style. No doubt France is the true cradle of Gothic, and in the early days of the Gothic Revival in England the English style was unduly exalted, and French Gothic almost overlooked, until Burges, who founded his own style much more on French than on English precedent, did something to open people's eyes to the glories of French Gothic, and prepared the way for a wider view of the subject. But admitting that French is the grander and more virile style, and shows a larger number of fine examples than England can boast, there is still something to be said on both sides; and a comparison of the cathedrals of the two countries shows that there are weaknesses in French Gothic and beauties in English Gothic which have been alike rather overlooked by modern writers, and which furnish matter for useful architectural criticism.

Our attention has been called to the subject by the publication of Mr. Bumpus's book on some of the French Cathedrals.* Mr. Bumpus's books on architecture have been rather of a popular order, and we have not attached very much importance to them in a general way; but this one is certainly the best that he has produced, and contains a good deal of interesting historical information in regard to the various buildings described; and the sheet of small comparative plans which has been added on a fly-leaf is a useful addition to the book; so much so that it might well have been given a more prominent position. Our complaint about his previous books was that they gave no plans. Possibly, however, the omission of plans in those, and the curious way in which they are subordinated in the present volume, is due to the prejudices of the publisher. Plans are not popular with the general reader, who wants to be amused rather than informed; and they are therefore very likely regarded as a blot upon a popular treatise.

These plans serve to illustrate one out of the three most marked differences in the general design of English and French cathedrals. All but one represent the *chevet* plan—the apsidal east end with radiating chapels—as typical of the French plan, as the square east end (after the Norman period) is of the English plan. This preference for the square east end in England is probably a reversion to earlier Saxon practice. While the Norman influence was fresh in England, in the half-century immediately succeeding the Conquest, and while the cathedrals were built by Norman architects, the Continental form of the apsidal east end prevailed, and there are few square-ended choirs of later style which have not the foundations of a Norman apse somewhere beneath their floors. But

as the Norman element became more fused into the English element in the country, the cathedral builders harked back to what was evidently the older tradition in this island. There seems to be no more in it than that; it was not so much architectural choice as ancient precedent. Of the superior effect of the *chevet* termination there can be no doubt; as Mr. Bumpus remarks, it seems curious that when it was once adopted in so important a church as Westminster, it should not have been imitated elsewhere. But Westminster was built obviously under French influence or example; apart from this, native tradition prevailed. The *chevet* form, indeed, brought the French architects under some difficulties in the ranging of the arcade of the apse with the broader arches of the straight portion of the choir, and led, as we see at Le Mans and Beauvais and elsewhere, to an awkward-looking stiling of the arches; but this defect is more than compensated for by the superior beauty and interest of the general design as compared with

MEAUX CATHEDRAL: TRANSEPT WINDOW.

the tamer effect of the flat east end. A characteristic of the English plan, too, is its far greater comparative length—also probably a reversion to Saxon tradition; and it is observable that while the English plan tends to narrow towards the east end, the French plan, in most of the finest examples, widens, sometimes to a marked extent, eastward of the crossing. Of the eight examples of plan given by Mr. Bumpus, five—Bayeux, Chartres, Reims, Le Mans, and Amiens—show this expansion of the plan towards the east end; a much finer architectural scheme than the contracting plan of the English cathedral.

The two other most important distinctions between the French and English type of cathedral are found in the treat-

*The Cathedrals of Northern France. By T. Francis Bumpus. London: T. Werner Laurie: 1911. Price 6s.

TYPES OF THE FRENCH CATHEDRALS.

ment of the west front and the centre. The French scheme, that of the two western towers, masking the ends of the aisles, is the finest and most effective treatment there can be for a cathedral front. But its almost universal adoption in France deprives the west fronts of that variety of invention which is so interesting in the English cathedral fronts. With the exception of York and Canterbury, no two English west fronts much resemble each other; Lincoln might have been somewhat similar had not the builders of the west towers fortunately recoiled from removing the Norman screen; Durham, Wells, and Lichfield, show the twin-tower scheme, but they are entirely different in character both from each other and from the two archiepiscopal cathedrals; and Ely and Peterborough resemble nothing else either in England or France, and are distinct and individual architectural conceptions. Taken together, there is more of interest in these varied designs than in the rather conventional repetition of the same scheme in the fronts of the French cathedrals. And in the third point, the treatment of the centre, the English type has unquestionably the advantage. The centre tower makes a far finer architectural composition than the French mass of high roof, with only a *flèche* at the crossing. Mr. Bumpus claims that there are more centre towers in France than is generally admitted; but with a very few exceptions, such as St. Ouen, these are in the early churches, which had more solid piers and less ambitious height than the later ones. The French sacrificed the possibility of the centre tower for the sake of a greater interior height than the English builders ever ventured on. The interior height has a grand effect, no doubt, when you are once inside; but one cannot have everything, and it may be questioned whether it compensates for the loss of the grandest and most effective of exterior features.

Some of the differences between French and English Gothic in the interior treatment of the buildings are instructive on questions of design. One peculiarity of the French builders was that they almost invariably omitted what we call the ridge-rib in vaulting. Anyone who compares an English vault with

a French one will see how far more satisfactory and complete is the design of a vault with the moulded ridge-rib, emphasising the apex of the vault, and forming a backbone to the vaulting design; the omission of it is a distinct weakness in French work. On the other hand, it is a question whether the later English vaults do not lose something in constructive effect by their elaboration of ribs which are not necessary to the construction. The fan-vault is indeed a beautiful and artistic form of roofing of which England may be proud, and here the moulded ribs are all used in the same manner, and form a consistent design, but it is consistent in the sense that none of them have anything to do with the construction at all; they are merely effective and expressive decoration. But the French, except in a few late examples, contented themselves with the plain quadripartite vault in its structural simplicity; even in so elaborate a late church as St. Ouen the vault is a simple quadripartite structure; and the effect is better and more truly architectural than that of the late English vaults with their multiplicity of "*lierne*" ribs, or of intermediate working ribs, which only weaken instead of strengthen the construction. A point in which French Gothic is inferior to English is in the fact that the principle of growth from the ground line is less completely developed. The French habit of starting a vaulting-rib with a special base of its own, standing on the cap of the main arcade piers—as may be seen in the interior view of Soissons, for example—gives a far less complete effect than the English habit of running up the vaulting-shaft continuously from the ground line. Mr. Bumpus speaks with enthusiasm of the effect of the choir of Le Mans, which he considers the most beautiful interior in any French cathedral; and it is noticeable that this, with its long uninterrupted vaulting-shafts and the design of its piers, is precisely the most English in style of all the interiors which he illustrates. The French practice of placing the base of one shaft on the capital of the one below it is probably a relic of the traditions of Roman architecture, so much more strongly represented in France than in England.

Inigo Jones and Webb.

MR. GOTCH'S paper at the Institute of Architects, on some drawings by Inigo Jones and Webb in the Burlington-Devonshire collection of drawings, left on us the impression that he made out a considerable part of his case, to the effect that some of the work, especially at Greenwich, which had been attributed to Jones, was more probably that of his pupil and admirer, John Webb; but we must be cautious as to accepting the conclusion that there is nothing of Jones's idea in the architecture of the King Charles block at Greenwich. Mr. Gotch says that there is "no evidence" that Jones had prepared any large scheme for Greenwich, reaching from the Queen's House to the river, for Charles I.; but that is only negative testimony after all. And it must be remembered that Webb was an enthusiastic admirer of his distinguished master, and would, we should imagine, have really preferred carrying out a design by Inigo Jones to working out one of his own.

One interesting point emphasised in the paper was the extent to which Palladio is responsible for the general form of much of the work of the earlier English Renaissance. But perhaps the point most brought home to one by the original drawings which were exhibited on the screen was, how impossible it is to form any adequate estimate of the work of English architects of the Renaissance period from their drawings only. In the present day, drawings of modern architecture are often extremely flattering in effect, and it is not uncommon to find the effect of the actual building exceedingly disappointing in comparison with what the drawing had led us to expect. With Inigo Jones and his contemporaries and immediate followers the reverse is the case; their drawings are mere scrawls intended only to suggest the general scheme on which the building was to be worked out; the actual detail was evolved in the course of execution. The only features in the drawings attributed to Inigo Jones which give any evidence of his artistic power are the sketches of intended sculptures of figures and carved ornament, which are put in, though roughly, with the freedom and power of a master. As to the architectural lines of the drawings, it may be questioned whether anything like the modern ruling-pen existed in those days; lines seem to have been drawn in somehow with an ordinary pen, and sometimes even by hand, without the assistance of a ruler.

The sight of these clumsy drawings, however, and even that of the crude drawing for the classic west front for St. Paul's, with its huge and disproportioned scrolls on either side of the crowning feature, should not suggest any doubt as to the real genius of Inigo Jones, and the justice of the place of honour given to him alike by his contemporaries and by modern critics. As to the façade of St. Paul's, it was probably a very different thing when carried out from what it appeared in the meagre drawing shown at the meeting in question. Probably, had we seen the drawings for St. Paul's, Covent Garden, we should have got from them no idea of the effect of that grand portico, essentially Inigo Jones's architecture, though materially a rebuilding. Here, and wherever we can positively trace Inigo Jones's hand in an actual building, it is the hand of a master in architecture. And the respect felt for him by his contemporaries must not be overlooked. A sham genius cannot impose on those who live with him, and work with him, least of all on his own assistant. As it is said that no man is a hero to his valet, so it might be said, perhaps, that few architects are heroes to their draughtsmen. But Inigo Jones evidently was; his draughtsman thought him one of the greatest men in the world; and such a testimony cannot be lightly dismissed.

On the whole, therefore, it does not appear that Mr. Gotch's discoveries, interesting as they are, can have any great effect on Inigo Jones's reputation and position. Even supposing it had been established more clearly than is possible by such slender evidence, that some of the work commonly attributed to Jones may be more probably assigned to Webb, there is still no doubt as to which was the mastermind.

SOISSONS CATHEDRAL: THE NAVE, LOOKING EAST.

SAN MINIATO AL MONTE,
FLORENCE.

BY J. TAVENOR-PERRY.

When, in 1874, it was intimated to Ruskin that the Institute proposed to present him with a Gold Medal, he gave as his reasons for declining the honour four facts which he considered so disgraceful to the profession that he could not consent to be so closely allied to it as the acceptance of a medal might imply, and the second of three reasons was, to give his own words from his letter to Mr. Eastlake, that "the church of San Miniato in Florence, the most beautiful example of twelfth-century architecture in that city, had been turned into a common cemetery." No doubt the painful and often incongruous features of a modern Italian grave-yard have done much to destroy the beauty of its surroundings, but the architectural characteristics of this remarkable church remain undisturbed. Its great mass still looks imposing and picturesque when seen from any of the bridges; and although the approaches have been modified and the gradients of its hill-road better adapted to the needs of modern traffic, from its terraced platform may still be seen one of the most beautiful views in the world: Florence with its background of mountains, as described by George Eliot in the poem to her "Romola."

All authorities concur in placing the date of its foundation in the year 1013, under the direction of Hildebrand, Bishop

of Florence; and there is nothing improbable in this, since the neighbouring duomo of Pisa had been begun seven years earlier. The work of Hildebrand was, however, confined either to what is now known as the crypt, or it may have

been a rebuilding of an earlier church of which the present crypt formed a portion; and this is particularly shown by the fact of the plan of the upper church not coinciding with that of the church below. The same thing happened at Canterbury when the choir there was rebuilt; and in both cases some of the upper piers had to be carried down through the vaulting of the crypt, as there were no corresponding piers below to sustain them. The crypt, or, more properly, the Confession, of San Miniato consists of seven aisles, vaulted in plain Roman vaulting carried on marble columns, some of which are fluted, and may have been taken from an ancient building, standing about ten feet from centre to centre. The three central aisles terminate eastward in the semicircle enclosed by the walls of the apse of the church above; and on the chord of this stands the shrine of black and white marble containing the remains of San Miniato, who, according to legend, was the son of an Armenian king, and to whom the church is dedicated.

The west front of the church, which, like other mediæval Florentine façades, is not particularly graceful in its form, has, under an arcade of five arches crossing the lower part, three large square-headed doorways, which form not only the entrances, but the principal means of lighting the interior. The whole front is panelled by an incrustation of black and white marbles, with a picture in glass mosaic in the centre of the gable, and above it a band of inlaid ornament which appears to be contemporary with the pavement of the nave. The aspect of the interior as seen on entering is well shown by the accompanying illustration; and the appearance of spaciousness it presents, although its internal dimensions are only some 165 ft. by 70 ft., is due to its good proportions and the manner in which it is lighted. Except the little openings in the clerestory which barely suffice for lighting the roof, and one small square opening in the western gable, there are no windows in the church which afford any direct light, for those which surround the apse are filled in with slabs of translucent alabaster; and the deep gloom can only be dispelled by opening the western doors.

SAN MINIATO, FLORENCE, FROM THE NORTH-WEST.

SAN MINIATO: VIEW OF INTERIOR FROM WEST DOOR.

The church is divided into three great bays by two bold arches across the nave springing from half columns which form parts of composite piers of a quatrefoil shape on plan; and each of these bays contains an arcade of three arches standing on single columns. The shafts of these columns are monoliths of marble, and some of them may be ancient, as may also be their capitals, which do not fit them, and which are surmounted by a moulded dossier curiously reminiscent of Byzantine influence. The roof is of open timber work richly decorated in colour, having to each of the great bays four framed principals which are connected in the centre by a narrow gangway running the length of the church, the soffit of which shows in the photograph reproduced on the preceding page.

Up the centre of the nave extends a rich inlaid pavement, like a broad strip of oriental carpet, consisting of seven great squares some 12 ft. across, of most beautiful designs formed by black mastic let into the white marble pavement. The date of its production is given as 1207 on one of the slabs near the entrance, and it is probably the work of the same artist who did similar work at the Baptistery which is dated 1209. At the end of this pathway,

and immediately in front of the steps descending to the Confession, is the Chapel of the Crucifix erected in 1448 for Piero de Medici by Michelozzo Michelozzi, which contains over the altar a richly painted and gilt reredos.

On each side of this chapel and within the aisles are two staircases leading up to a gallery, which crosses the church from north to south on the choir level, but separated from it by the marble walls of the choir screen. This wall, which stands some seven feet in height, is of white marble, carved and panelled, and decorated with inlays of black marble and mastic. This screen, almost as unique in its arrangement as it is remarkable for its beauty, somewhat resembles the work to the walls of the great font in the Baptistery of Pisa, dated 1246, usually ascribed to Guido Bigarelli of Como, but which Rohault de Fleury speaks of as the work of Lino. At the south end of this screen, partly supported on the wall and partly on the marble columns, is an ambone of the usual Tuscan type, but richly decorated with carving and inlay, evidently the work of the sculptor of the screen walls. The desk for the Gospel is supported by a finely carved eagle standing on the head of a human figure which is again carried

on a lion; and the ambone is approached by a staircase directly from the choir, within which the stalls are of very beautiful intarsia work. Except for the roseate glow which penetrated through the slabs of alabaster at sunrise, or the fainter light which fell from the clerestory windows, the choir was always in gloom; but in the apse the great figure of Christ enthroned on a golden background, which caught every reflected gleam, was always visible.

On the south side of the choir is the Sacristy, the walls and vaulting of which were painted in 1388 by Spinello Aretino with the legend of St. Benedict. The grey-coated brethren of Monte Cassino are treated like the champions of the church-militant and remind one of Spinello's treatment of the warriors in the paintings on the walls of the Sala di Balia at Siena. On the south side of the nave opens out a small chapel designed by Antonio Rossellino to contain the beautiful effigy, which he also sculptured, of Cardinal Giovanni di Portogallo, who died in 1466, one of the most perfect pieces of monumental sculpture of the Italian renaissance. The roof of the chapel is decorated with medallions of the four Virtues by Luca della Robbia, and the walls have sculpture by Antonio Pollajudo.

On the north side of the choir stands a campanile erected by Baccio d'Agnolo (the architect also of the tower of S. Spirito) raised on the site of the ancient campanile ruined in the attack on Florence, in 1529, by Philibert of Orange the general of the Imperial armies. When to the unnatural alliance of Pope and Emperor it was decided that the liberties of Florence were to be sacrificed, the citizens appointed Michelangelo to be their *Commissario generale*, and entrusted him with the direction of the fortifications. The elevated position of San Miniato made it an important point, as from the old campanile all the movements of the besiegers could be noted. The result was, the tower became a mark for the enemy's bombards; and although Michelangelo suspended woollen mattresses from the cornice it became so shaken that it had to be rebuilt. Considerable portions of the fortifications which were then erected still remain, and these grouping with the church, give a picturesque and castellated appearance to the building when seen from the valley below.

OBITUARY.

Mr. Ernest Crofts, R.A.

Mr. Ernest Crofts, R.A., Keeper of the Academy, died on Sunday last, aged 64.

The Late Sir John Aird.

The will with two codicils of the late Sir John Aird has been provisionally proved at £1,100,000.

Mr. J. S. Kirk.

The death is announced of Mr. James Sheard Kirk, senior partner in the firm of Messrs. John Kirk and Sons, architects, of Huddersfield. Amongst the buildings for which the firm have been architects are the Crosland Moor Workhouse, the Huddersfield Union Offices, and the Marsden Parish Church, with which the deceased was closely identified. Mr. Kirk was in his 69th year.

Mr. Charles Berrington.

The late Mr. Charles Berrington, builder and contractor, of Bedford and Liverpool, left estate which has been proved at £331,935 gross. The late Mr. J. Howard Colls left property of the gross value of £419,797. But the record builder's estate is probably that of Mr. Edward Yates, of Herne Hill and Southwark, who died in 1907 leaving estate of the gross value of £919,414.

SAN MINIATO: DETAIL OF CHOIR SCREEN AND AMBONE.

INIGO JONES OR JOHN WEBB?

BY J. ALFRED GOTCH, F.S.A., F.R.I.B.A.

In his paper on "The Burlington-Devonshire Collection of Drawings," read before the Royal Institute of British Architects on March 13th, Mr. J. A. Gotch made not the least important of his many valuable contributions to architectural history. His careful examination of the collection points to the somewhat startling conclusion that much of the work that has been hitherto attributed to Inigo Jones should be assigned to his nephew and assistant, John Webb.

AT a general meeting of the Royal Institute on June 27th, 1892, this collection of drawings was first exhibited to the members, and on December 17th, 1894, they were, by a Declaration of Trust, placed in the custody of the Institute. We are indebted to Mr. J. D. Crace for this valuable addition to the library. Attached to the Declaration of Trust is a schedule, which enumerates 17 bound volumes of drawings, mostly by Palladio; and two boxes of miscellaneous drawings in number about 295. Turning to Mr. Crace's description, he concludes his remarks on these loose drawings by saying, "These boxes require careful sorting before any satisfactory list of the contents can be made." It is these unsorted drawings which are the subject of the present paper. They have now all been sorted and arranged, and they have been numbered, so that the classification may be preserved, or perhaps improved, should further light be thrown upon the few which are still obscure, and there is in preparation an annotated catalogue.

They are of very great interest, being connected largely with our own Inigo Jones and his relative and assistant, John Webb. They throw some curious and, perhaps, unexpected light upon the relations of the two men.

Two Important Collections.

The two best known and most important collections associated with the name of Inigo Jones are those at the Royal Institute and those at Worcester College, Oxford. It is a curious fact that a careful investigation of both collections goes to show that they are both more closely connected with John Webb than with Inigo Jones: indeed, there is reason for thinking it highly probable that they are the two halves of the same original collection. It is said that Dr. Clarke, who bequeathed his architectural books and drawings to Worcester College, bought the latter from the widow of Webb's son. The original Webb collection, which (if my conjectures are right) was thus divided, consisted mainly of Webb's own drawings, but among them was a certain number made by his venerated master. References occur in one or two books to some drawings by Jones preserved in the Soane Museum, but from a careful investigation recently made in company with Mr. Walter Spiers, the curator of the Museum, there is great doubt whether any of these drawings were made by Jones. In particular, those of King Charles's block at Greenwich, held by some to be Jones's original design for that building, must have been made at a much later date.

Our own collection illustrates in a most interesting manner the changes which have come over the methods of house-design as compared with what is to be found in the Thorpe and Smithson collections. It shows in what a new way the design both of plan and elevation was approached; how all-important accurate proportion was considered; and how profound an influence Palladio now exercised on design both in

methods and results. My immediate object, however, is to consider the following three points: (1) The draughtsmanship of Inigo Jones; (2) His relations with John Webb; and (3) The authorship of the design of the second portion of Greenwich Palace, known as King Charles's block.

Scarcity of Drawings signed by Inigo Jones.

There are not many drawings left which were actually signed by Inigo Jones. In the Burlington-Devonshire collection there are five, all architectural subjects. But there are others bearing his handwriting, and these may safely be attributed to him. A study of these goes to show that neat architectural draughtsmanship was not his strong point. There are three indeed (a porch signed "Inigo Jones fecit 1616," a certain house signed "Inigo Jones," and the west front of St. Paul's Cathedral, unsigned), which are surprisingly poor stuff for so great a man to have produced. The porch, dated 1616, was drawn after his final return from Italy, when he was 43 years old, and after he had studied the masterpieces of Italy. The west front of St. Paul's was begun some fifteen years later, in 1631. The design is classic in treatment, and was to be applied to a Gothic building. This, in itself, was no great fault, inasmuch as classic was becoming the prevalent style, and Jones had no competent knowledge of Gothic. But the design itself is a curious medley. The lower storey is well-proportioned and interesting. But the upper storey is a wonderful mixture of incongruities. The great scrolls are as much too large in scale as the lanterns, which crown the towers, are too small. The three central windows are rather overpowering, and the arch of the middle one bites into the frieze above it with indefensible voracity. I venture to think that no one, on seeing this drawing, would take it to be the work of a master in architecture. Curiously enough, when the work was carried out, the lower storey was masked by a widely projecting columnar portico of good design; while the upper storey was carried out very much as drawn, but with a few improvements. These will be readily seen on comparing the drawing with Hollar's view or with Kent's elevation, which agree, on the whole, tolerably closely.

John Webb expressly credits Jones with the (then) recent improvements to St. Paul's: he was, he says, "the sole Architect . . . who, in faithful Discharge of that Trust reduced the Body of it from the Steeple to the West End into that Order and Uniformity we now behold; and by adding that magnificent Portico there, hath contracted the envy of all Christendom upon our Nation, for a Piece of Architecture, not to be paralleled in these last Ages of the World."

The drawing of the house (signed by Jones) shows a small building of no great architectural pretensions, a columned portico being the only feature having any detail of consequence. It would probably have been designated "a lodge," and it was, like many houses of the time, rather an exercise in proportion than an attempt

to provide suitable accommodation for daily wants.

Jones's Draughtsmanship.

It is curious that of the five signed drawings two should give so inadequate an idea of the master's power. Two of the other signed drawings give the details of a gateway for Lord Lincoln at Weybridge. The design of the front shows a massive, well-proportioned archway. It is true that, if it were the work of a less famous man, exception might be taken to the woolly masses that adhere to the pillars and the cornice. There are, however, precedents for this particular treatment in some of Serlio's designs. There is a certain amount of free-hand drawing in this example; and in those which follow it is still more in evidence, and the conclusion to which all these drawings point is that Jones was much more at home with his pencil and pen than he was with his tee-square and compasses. He was at his best in his sketches for carving, and particularly in those of the human figure. His cupids, his caryatides, and his busts are touched in with a skill and facility that would have done credit to any of his beloved Italian masters. Where straight or formal lines were required, he was happiest when he ruled them in with his ordinary pen, or even dispensed with a ruler and got them as straight as he could with his unaided hand. There is one drawing (of a chimney-piece) attributed to him where all the carving, including cupids and angels, has been admirably sketched in and shaded, while the architectural members are only faintly indicated, and have been left for a more mechanical person to finish; but the mechanical person never did his work, and the drawing remains incomplete.

This view of Jones's draughtsmanship is strengthened by his sketch-book, preserved at Chatsworth, of which a few facsimile copies were made, one of the number being now at the Soane Museum. In this little collection there are none but free-hand drawings, and those mostly of the human figure and costume, all done with great skill and freedom.

Curiously enough, John Webb, in his "Vindication of Stone-Heng Restored," expresses the same view of his master's drawing: "Mr. Jones," he says, "was generally learned, eminent for Architecture, a great Geometrician, and in designing with his Pen (as Sir Anthony Vandike used to say), not to be equalled by whatever great Masters in his Time for Boldness, Softness, Sweetness and Sureness in his Touches."

Relations of Jones and Webb.

We now come to the relations of Inigo Jones and John Webb. Jones was the uncle of Webb, and took the lad into his office in 1628, when he was seventeen years old. It is assumed, and probably with truth, that Webb remained working with his uncle until the latter's death in 1652. Webb became a very excellent architectural draughtsman; and if the estimate of Jones's powers in this direction suggested by these drawings be correct, Webb must have been his right hand. Webb has always been regarded as a pale shadow of Jones. He himself had an unbounded admiration for his master, and asserted that Jones's reputation abroad was greater than it was at home. His contemporary, Evelyn, speaks of him as "Mr. Webb (Inigo Jones's man)." But an unprejudiced examination of the Institute drawings and those at Worcester College seems to lead to the conclusion that in spite of the depreciatory attitude of those who have written about Webb, a little reputation ought to be added to his stock, and perhaps, a corres-

ponding little deducted from that of Inigo Jones.

The Assignment of Greenwich Hospital.

In Kent's two volumes of "The Designs of Inigo Jones," the drawings are by Flitcroft. Whence did he get his particulars? The original drawings are extant. Who made them? The writing on them suggests to me that they were not by Inigo Jones, but by John Webb. (Mr. Gotch detailed his reasons for supposing that the credit for the design of King Charles's block at Greenwich must be transferred from Jones to Webb; unless, indeed, we feel ultimately compelled to re-transfer it to Palladio, for on plate 12 of the second book of Palladio's "Architecture" is the detailed elevation of a house at Vicenza, built by the Counts Valmarana, to which Webb's elevation of the end blocks of his building bears a striking resemblance.)

The Hand is the Hand of Webb.

It is not difficult, said Mr. Gotch, to distinguish between the draughtsmanship and writing of Jones and those of Webb, and the conclusion forced upon the mind is that even in the present day much that is really Webb's has been attributed to Jones. "It may, of course, be replied that the hand is the hand of Webb, but the inspiration is that of Jones. To which I respectfully answer, Produce the evidence.

"It is by no means my desire to decry Inigo Jones, or to start a crusade against his reputation. There is no wish to suggest, for instance, that John Webb was the first and greatest of architectural ghosts, and was exploited by his famous master. But it is only right that the evidence of these drawings should be carefully weighed, and one result, I cannot help thinking, will be the conclusion that John Webb was not merely a pale shadow of Jones, but that he was a man of remarkable independent ability."

Discussion.

Mr. J. D. Crace, proposing a vote of thanks, referred to his connection with the Institute collection of drawings—an incident in his life upon which he looked back with unmitigated satisfaction. The date of the Queen's House at Greenwich, he continued, was beyond question, as it was actually inscribed on the front of the building. John Webb certainly deserved higher praise as an architect than he had hitherto received. He, Mr. Crace, had no doubt in his mind that Webb was actually responsible for King Charles's block. It was not difficult to see how the design came to be attributed to Inigo Jones. It was quite natural to ascribe the work to the greatest name that history suggested. He was surprised to hear of the existence of the foundations of old Greenwich Palace in the east wing. He had always understood that the old Palace of Henry VIII. extended east as far as, or a little beyond, the present east gate of the Hospital. Concluding, the speaker complimented Mr. Gotch upon his careful analysis of the old drawings and for his very able paper.

Mr. Lawrence Weaver, seconding the vote of thanks, doubted whether Webb did the drawing of the ceiling at Wilton, although the handwriting was his. This should be a lesson to gentlemen present not to allow assistants to sign drawings. A thorough search, he thought, would reveal some reference to Webb's work at Greenwich. He was not sure that it was quite fair of Mr. Gotch to say that the onus of proof lay with Inigo Jones. The documents of the period were certainly very sparse, but he thought that Jones would not have gained such a reputation

on "ghosts." The drawing of Inigo Jones's addition to the west front of St. Paul's was rather a parody on the work as actually carried out. The present St. Paul's Church, Covent Garden, was, as we knew, not the original church designed by Inigo Jones, that having been destroyed by fire. But the present church gave a fair representation of Jones's original work; yet it differed from the drawings of the period, which did no great justice to Jones's design.

Mr. W. R. Adkins, M.P., said it seemed that certain contentions of Mr. Gotch had the support of the history of the period to which he referred. It was quite plausible that Jones, called in to design works like masques, should find a greater delight in the freedom of the pencil than in the more strictly scientific instruments. Jones, it seemed, was greater in the less rather than the more acutely technical detail in design. The Queen's House at Greenwich was finished in 1635; and he thought that the period from 1631 to 1642 was, for obvious reasons, an inconvenient one for the spending of public money on works of a public character. During that period Charles I. was hard put to it to find money; and there was a very great lack of resources for these undertakings. That Inigo Jones's design for Temple Bar was not carried out was reasonably to be ascribed to this fact. In his concluding remarks, the speaker

alluded to the extraordinary reverence that was paid, at the Restoration, to things done before the Civil War, and quoted some lines by Dryden to Congreve in support of his contention.

Mr. J. T. Maine (Librarian to the Duke of Devonshire, at Chatsworth) said that the paper was to him one of extreme interest, as, in the course of his work at Chatsworth, he had to consult Inigo Jones's drawings for masques, and also his sketch-book. There could be no doubt that Jones was more at home in freehand drawing than when trammelled with instruments. His first sketch-book gave an impression of great power and mastery. In his sketch-book used on the journey to Italy, before 1620, he had apparently jotted down with the pen the things that interested him as he stood before them. The drawings for figures in the masques were first done in pencil, and, after many erasures and corrections, subsequently inked in. It had occurred to him that there seemed to be two hands at work in the drawings, and he remembered saying to Dr. Ashbee, "Who is the other man?" Mr. Gotch had given them a great deal of illuminating information on the subject. The paper, he continued, threw much new light on the drawings at Chatsworth. With regard to the drawing for Wilton House ceiling, was it not possible that the quality of the ink and the handwriting might determine

RESIDENCE OF GEO. L. RIVES, NEW YORK CITY.
CARRÈRE AND HASTINGS, ARCHITECTS.

whether the drawing was done by the same hand?

Mr. C. R. Peers said that until the age of forty-two Inigo Jones was an arrant amateur. Until after his return from Italy his chief artistic work was connected with the designing of scenery for masques, which could hardly be called architectural work. Inigo Jones lived in a most critical time for English architecture; and it could not be claimed that what he gave us was a vernacular style. The Banqueting Hall in Whitehall was absolutely different from anything else contemporary with it. But Jones founded a basis of scholarly architecture; and Webb seemed to be greatly influenced by the work of his master. Webb's mind was not so scholarly; but he produced work that was considerably affected by the scholarly inspiration brought by Jones from Italy. Probably one-third of the work that it was customary to attribute to such men as Jones, Wren, or Gibbons was undoubtedly not their own, but that of men who were taught by them, and who produced work in the same style.

Mr. Gerald Horsley thought that the paper taught a good deal about draughtsmanship. The drawings they had seen on the screen were very much of the quality of Palladio.

Mr. Maurice B. Adams said he had long been familiar with the drawings. The draughtsman, whoever he might have been, did seem to realise the gist of the whole thing, which many of our modern and more adroit draughtsmen missed. He wanted draughtsmen to study the drawings themselves, and to get true proportion and scale.

Mr. Leonard Stokes said that if Webb did work that was attributed to Jones he thought it only right that we should have the facts.

Mr. Gotch, in reply, said, with regard to the ceiling at Wilton, that the drawing had Webb's handwriting upon it, and it seemed quite consistent with what we could see of Webb's power as a designer. It was quite natural, he thought, that Jones should absorb more than he deserved; and he could quite well lose some of the credit without at all detracting from his reputation. Nine of the drawings for Whitehall Palace were done by Webb. It was customary, continued Mr. Gotch, to believe that the Banqueting Hall was the only piece of a large scheme carried out. He questioned whether this was the case, and suggested that the Hall was erected as a complete building, and that it was afterwards proposed to add to it. The portico of St. Paul's, which was so much extolled, was not represented by the drawing which he had thrown on the screen. Regarding the drawings for masques, it was quite possible that Webb, born in 1611, and joining Jones in 1628, helped with the later masques; but it was improbable that he helped with the early ones.

Paper and watermarks were important factors in the examination of old drawings; but as they were usually mounted it was difficult to utilise the evidence that would be thus afforded. The great advantage of the Worcester Collection was that they were unmounted. If they turned over the pages of Palladio, and then those of Kent, they would plainly see the source of inspiration of English architecture. The drawings were all founded on Italian examples. In support of his theory that Inigo Jones was credited with work for which he was not actually responsible, Mr. Gotch quoted the instance of the book on "Stonehenge Restored," which was published from in-digested notes after Jones's death.

THE WORK OF THE LATE JOHN M. CARRÈRE.

The untimely death of Mr. John M. Carrère, which was announced at last week's meeting of the Royal Institute of British Architects, will call forth universal regret. Mr. Carrère, whose death was the result of a collision between a tram-car and a motor cab, was to have read a paper on "The New York Public Library" before the Institute in May next; and the unfortunate accident actually occurred just before his intended departure for England.

Mr. Carrère, who was fifty-two years of age, was a partner in the firm of Carrère and Hastings, who, since the break-up of the partnership of McKim, Mead and White, have undoubtedly taken first rank among American architects. John M. Carrère and Thomas Hastings were both draughtsmen together in the office of McKim, Mead, and White, and in the year 1885 they entered into partnership and commenced to practise.

Mr. Carrère was born in Rio Janeiro, Brazil, in the year 1858, but according to

THE LATE JOHN M. CARRÈRE.

the American and Brazilian laws he was an American by birth. He was educated in the schools of Brazil and Switzerland, and at the Ecole des Beaux-Arts became an "élève de Première Classe."

Besides works designed in collaboration, each member of the firm has worked in his individual capacity. Mr. Carrère devoted many years to the teaching of ethics, and to the education of the younger professional men in the art of design. The Society of Beaux-Arts Architects was founded in 1894 at his suggestion, and several ateliers were formed to work under the auspices of that society. Mr. Carrère was made the first Chairman of the Committee on Education, and he outlined the course in architectural design which has revolutionised the system formerly prevailing in the American colleges. The fundamental principle which he introduced into the American system of architectural education is, that design is the first essential to architecture—that whatever other training a student may receive he is wholly unfit to practise architecture unless thoroughly

trained in design. Mr. Carrère was for two terms President of the Society of Beaux-Arts Architects, composed of pupils of the Ecole des Beaux Arts residing in the United States.

The very important work of establishing the Art Commission of the City of New York was entirely Mr. Carrère's idea, and was put through by himself and his friends, notwithstanding the pessimistic views of the art interests at large.

Mr. Carrère was Chief Architect of the Pan-American Exposition, and Chairman of the Board of Architects in charge of the grounds and landscape features of the Exposition. Besides this, he has personally held other very numerous appointments.

The first notable success which he and his partner achieved was in the great competition for the Cathedral of St. John the Divine, New York, in which they gained the first premium; but the magnificent design was never carried out.

Two important works of the firm are the House and Senate Office Buildings, inspired directly from Perrault's colonnade of the Louvre and Gabriel's buildings on the Place de la Concorde, which to the architects represented the most complete and successful expression of the monumental architectural work of the eighteenth century in France. But however clear the source of inspiration, and however frankly acknowledged, there is no suggestion of slavish copying of the older work, but the scholarly study of a new and fresh design.

The following list represents the most important works completed by Carrère and Hastings.

Public and Educational Buildings:—New York Public Library, New York City; Annexes to the U.S. Capitol, Senate Office Building, Washington, D.C.; House, Office Building, Washington, D.C.; Borough Hall, Borough of Richmond, N.Y.; Ferry Terminal, Borough of Richmond, N.Y.; Paterson City Hall, Paterson, N.J.; Administration Building for the Carnegie Institution, Washington, D.C.; City Hall, Portland, Maine; fourteen Carnegie Branch Libraries in New York City; Manhattan Bridge and Approaches, City of New York; New Theatre, New York City; Woolsey Hall, and the Memorial Dining Hall at Yale University, New Haven, Conn.; Rockefeller Hall and Goldwin Smith Hall at Cornell University, Ithaca, N.Y.; Science Hall at Hamilton College, Clinton, N.Y.; McKinley Monument, Buffalo, N.Y.; Pedestal of Lafayette Monument, Paris, France.

Churches:—Methodist Church and Parsonage, St. Augustine, Florida; Presbyterian Memorial Church, St. Augustine, Florida; Central Congregational Church, Providence, Rhode Island; Christian Science Church, New York.

Office Buildings:—Mail and Express, New York City; Pierce Building, New York City; Blair Building, New York City; Royal Bank of Toronto, Canada; Traders Bank in Toronto, Canada; Pan-American Exposition, Buffalo, N.Y.; St. John's Park for the City of New York; Hamilton Fish Park for the City of New York.

Country Estates:—E. C. Benedict, Greenwich, Conn.; C. Ledyard Blair, Peapack, N.J.; E. H. Harriman, Arden, N.Y.; Murray Guggenheim, Elberon, N.J.; Otto H. Kahn, Morristown, N.J.; Whitehall for Henry M. Flagler, Palm Beach, Fla.; Giraud Foster, Lenox, Mass.; Mrs. Richard Gambrill, Newport, R.I.; Walter Jennings, Cold Springs Har-

BUILDING FOR THE HOUSE OF REPRESENTATIVES, UNITED STATES CAPITOL GROUP, WASHINGTON. CARRÉRE AND HASTINGS, ARCHITECTS.

bour, L.I.; Colonel Oliver H. Payne, Esopus, N.Y.

City Residences:—Mrs. Richard Townsend, Washington, D.C.; Mrs. Ralph Ellis, Washington, D.C.; Honourable Elihu Root, New York City; Honourable George L. Rives, New York City; Doctor C. A. Herter, New York City; Charles F. Hoffman, New York City; Burrah Hoffman, New York City; Richard M. Hoe, New York City; Doctor E. K. Dunham, New York City; John H. Hammond, New York City; Frank H. Goodyear, Buffalo.

A complete and fully illustrated account of the firm's work was given in our "Architects of the Day" Series, in the issue for May 18th, 1910. In the present issue the centre plate illustrates some representative buildings.

A ROYAL REBUILDING SCHEME.

At the recent meeting of the Council of his Royal Highness the Prince of Wales, at which his Majesty the King presided, a scheme for the rebuilding of the Duchy of Cornwall Estate at Kennington was under consideration.

The Estate has suffered in the past from the practice which prevailed in the first half of the nineteenth century of granting small plots of land on leases for terms of

three lives. The system was happily ended by the Prince Consort, but many of the old leases are still outstanding, and the property till recently was so interspersed with houses held on this precarious tenure that it has not been possible for any comprehensive scheme for dealing with the estate as a whole to be carried into effect.

Efforts, however, have been made, whenever sufficient space was at disposal, to improve the housing accommodation by the erection of improved dwellings.

In March, 1910, after a number of old leases had expired, his Majesty, as Prince of Wales, commissioned Mr. S. D. Adshhead, Professor of Town Planning at Liverpool University, to report on the condition of the property and to make suggestions for its improvement.

This scheme, which was considered at a recent meeting of the Council, practically involves the entire reconstruction of the older property. The proposal is to build improved cottages and small seven and eight-roomed houses of two storeys over the greater portion of the estate. Apart from a small number of three-storeyed dwellings for old tenants, and superior flats facing the Oval Cricket Ground, the erection of block dwellings is not contemplated.

THE GREEN MARBLE OF CONNEMARA.

It is a well-known fact that Ireland has mineral resources of great value which only need the necessary capital for their exploitation, and prominent among these resources are marble and building stones. Connemara is rich in deposits of the very fine green marble which bears its name. This marble has been known to architects for a long time past, but, as with other minerals in Ireland, great difficulty has been experienced in securing it in any quantity and in large enough sizes. The matter is purely one of business enterprise. The marble is there, and it only awaits the arrival of a development company organised on up-to-date lines and equipped with modern plant in order that it may be available for architectural and other requirements. It is with the express object of effecting such development that a company is now being formed—the Connemara Green Marble Quarries, Ltd.—(offices, Carlton House, Regent Street, W.) with a capital of £100,000. This company proposes to acquire 1,000 acres of land at Recess, County Galway, containing vast deposits of the green marble, of many different shades, to quarry the material, and to place it in any desired quantity at the disposal of the architectural profession and building trades. The deposits have been examined by experts, who speak of "a practically inexhaustible supply of the finest grade of all shades of very beautiful and rare green marble," and as it is estimated that the total cost of production will not exceed £4 per ton on an annual output of 7,000 tons only, while the selling price would be £9 per ton, and more—some of the deeper and rarer shades realising £30 per ton—there seems to be the prospect of a good investment. Dividends of from 25 to 30 per cent. are mentioned in the prospectus.

Marble is now being increasingly adopted as an interior finish to walls of business and other premises—particularly in the United States, to which a considerable supply of Connemara marble has been shipped for some years past—and the exploitation of a great deposit of fine material in our own Kingdom will doubtless be followed with great interest by architects and builders.

LONDON MASTER BUILDERS ASSOCIATION.

The monthly meeting of the Council was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, March 16th, Mr. G. Bird Godson in the chair, supported by the officers and a large number of members.

The quarterly financial statement was presented by the Finance Committee, and, after discussion, adopted. The various committees for the year were appointed, also the conciliation boards for the various trades.

A proposal for affiliation from the Master Decorators was considered, and it was unanimously resolved to agree to the same, it being considered an important step towards unity in the trade.

Various items of interest to the Trade were discussed. Mr. F. J. Gorham, builder and contractor, of Point Hill, Greenwich, was elected a member of the Association. Messrs. W. Bloore and Son, timber merchants, of South Lambeth Road, were elected associate members.

Bolton Improvement Scheme.

Mr. Thomas Mawson, Hon. A.R.I.B.A., was assisted by Mr. Robert Atkinson, A.R.I.B.A., in the preparation of this scheme, dealt with in our last issue.

BUILDING FOR HOUSE OF REPRESENTATIVES, WASHINGTON: DETAIL OF FACADE. CARRERE AND HASTINGS ARCHITECTS.

MAGAZINES & REVIEWS.

In the "Art Journal," Mr. Luther Hooper, in an article on "Art in the Church" (under the serial heading of "Art of To-day"), observes with only too much truth that "no department of art has suffered more from the separation of design from workmanship than that of painted glass." But the criticism might be made with equal truth about the whole field of what is called church art—in silversmith's work, and in textiles, as well as in stained glass. For many years all these things, but more especially the stained glass and the church plate, have been produced by trade firms, with the natural result that they have lost vastly in artistic value. We are only just beginning to emerge from this influence of trade art, the ill effects of which are more noticeable in stained glass than in any other form of work, because it is in itself an art of such beautiful capabilities, and because no other form of decoration is so prominent in its effect on the interior of a building. Numbers of old parish churches are disfigured by these windows put in by trading firms, and actually designed by workmen in their employ whose names are not allowed to appear, and who therefore can have no pride or interest in their work. And when a window is designed by an independent artist it may be spoiled in the manufacture, for the colour effect is all-important; the real effect of coloured glass can only approximately be shown in a coloured cartoon, and there is no certainty that the original artist's ideal will be reached in the executed window. As Mr. Hooper suggests, the only way to ensure the best artistic results in stained glass is for the work to be put into the hands of independent artists, and for those artists to be not only the designers but the makers of the glass. "Artist in stained glass" ought to be as distinguished and honourable a title as "painter" or "sculptor"; and when it becomes so we shall have the chance of seeing something really fine in modern stained glass. Among other articles in the same issue is one on "The Glamour of Landscape," by Mr. Lewis Hind, which is mainly occupied with observations on and illustrations of the landscape backgrounds of the early Italian painters; a most interesting subject which has hardly received sufficient attention from students of landscape art.

The "Burlington Magazine" contains a short article by Mr. F. W. Hasluck on a rather new subject—"Genoese Lintel-reliefs in Chios." The island of Chios was for more than two centuries (1346—1566) a dependency of Genoa, and there have been preserved there a certain number of sculptured lintels, similar to those found on some of the palaces of Genoa, and no doubt carried out by Genoese workmen. Two of these, now in the South Kensington Museum, are illustrated. The issue contains an article on "Old Marcasite Jewellery," by Mr. D. C. Falcke. Marcasite, or "marquiseite," is a pyrite which, when faceted, can be used as an imitation of diamond, and, according to the author, was largely so used in the eighteenth century. Judging from the illustrations, a good deal of beautiful jewellery seems to have been produced in the shape of marcasite in decorative settings. Browning, whom nothing in art seems to have escaped, refers to marcasite in his drama, "Colombe's Birthday," where a courtier tells a visitor—

"Yon green urn's veritable marcasite,

The Pope's gift"; though Browning seems to have been under a mistaken impression that marcasite was

of special value, whereas it seems to have been in reality an inferior material used to imitate more precious substances.

The "Architectural Record" (New York) is very largely taken up with "Recent Philadelphia Architecture," including in two separate articles "City Buildings" and "Suburban Dwellings." There are a good many buildings among these with a strong British tradition about them; the Provost's Tower of Pennsylvania seems to have been suggested by Heriot's Hospital. St. Mark's Protestant Episcopal Church is a rather mild piece of late Gothic. The American architects, though following English Gothic, never seem to get into the true spirit of the style. The church of St. Francis de Sales, of which Mr. H. D. Dagit is the architect, is a more original building, owing something, perhaps, to the influence of the modern French quasi-Byzantine style; it is a domed church with twin towers or cupolas flanking the facade; both these and the central dome are said to be covered with polychromatic tiling, which would have a good exterior effect; but the building, as shown in the monochrome illustration, does not attract us much; the general effect is good, but the detail seems commonplace. The United States Post Office, Custom House, and Court House at Cleveland, by Mr. Arnold Brunner, is a fine square classic building, with a Corinthian order running through the upper three storeys, on a rusticated ground storey; the architectural scheme is what one has seen again and again, but it is well carried out in a scholarly manner. The Technical Department of the paper contains a description and illustrations (with sections) of an immense modern "store," a kind of American Selfridge's, but with a very different architectural treatment.

The "Contemporary Review" contains an article by Mr. Wynford Dewhurst on "What is Impressionism?" which will be read with enthusiasm by those who have already run mad after the latest impressionism, and with laughter by those who have not. As a summary, we learn that an impressionist picture "is a cheerful optimistic picture, nobly up-lifting, good and healthy to live with. . . . indeed, so charming is it, that throughout a lifetime's association it retains its power of evoking pleasurable emotion." It is certainly amusing to read this and to think of the recent Grafton Gallery Chamber of Horrors. And before Manet and Monet, we suppose, there were no pictures that were uplifting to live with. Mr. Dewhurst considers that he has got Ruskin on the side of impressionism by a sentence to the effect that "a good artist habitually sees masses, not edges, and can in every case make his drawing more expressive by rapid shade than by contours." Did any one ever doubt it? That is one of those obvious truths in art which Ruskin thought he had discovered, whereas what he really did (which was no doubt a great benefit) was that he was the first to attempt to render them popular knowledge. But for one sentence in Ruskin which might seem to favour impressionism it would be easy to quote fifty which would be dead against it. The whole thing is one of the numerous crazes of the present day, which will have no lasting influence on sound and sane art.

The "Studio" appears to have been inviting a competition for designs for a village hall, and publishes some of the designs received (plans and perspective sketches). What strikes one in the designs is that all the competitors seem to have

been making designs for an ancient village instead of a modern one; high roofs and half-timber construction seem to be thought the necessary architectural ingredients of a village hall. High-pitched roofs are not the natural way of building now; they are only an affectation. Some of the plans are rather naive in their arrangements. "Lothian" shows "retiring-room—male" and "retiring room—female" ("gentlemen" and "ladies" is a pleasanter expression) accessible by doors opposite to each other out of the main hall, in full view of the audience; "Dannwin" the same. There should always be a separate entrance managed for those who are to be performers, instead of requiring them to come through the audience. And "Thatch" seems to think that one dressing-room will do for ladies and gentlemen.

It is of some interest to note that the "Gazette des Beaux-Arts" has an article on our great and sadly neglected English genius, Flaxman, by Mdlle. (or Mdme.) Jeanne Doin. The article, if not exactly enthusiastic, is highly appreciative, and what criticism there is is reasonable and not uncalled for. It is true that Flaxman's exceedingly methodistic turn of mind prevented him from altogether realising either the Pagan or the mediæval spirit of life. One may recall the story of Fuseli, when "keeper" of the Royal Academy, quitting a dinner party with the words "Farewell, friends! Farewell, wine! Farewell, wit! I must go and preside at sermon, the first from the Rev. John Flaxman." But Mdlle. Doin does full justice to the serene beauty and individuality of Flaxman's outline designs to Homer and Dante, of which several reproductions are given.

In Scribner, "The Field of Art" is occupied by illustrations and a description of the monument at Washington to General Grant—a thing on a scale that might have better suited a monument to Napoleon. There is a long platform with steps along one side; an equestrian statue of Grant across the centre axis, four lions on pedestals surrounding it, and at the far ends an artillery wagon and a cavalry group respectively. The equestrian statue is fine in pose; the sculptor is Mr. Merwin Shrady. Another article gives a description and illustrations of "The Hall of Panels" in the house of Sir L. Alma-Tadema; apparently there are a number of long, narrow upright panels each painted with a subject by a well-known artist; illustrations of all are given. This will interest many English as well as American readers.

The "Century" contains a well-illustrated article on Carcassonne. There is also an article called "A New Motive in Decoration," though there seems to be nothing new about it except that the subject, "The Building of the House of Wisdom," may not have been used before; otherwise it is only one more piece of wall decoration carried out in a private house in Philadelphia. The artist is a lady, Miss Violet Oakley. A coloured view of one of the lunettes shows a very pleasing result.

Change of Address.

Mr. S. Douglas Topley, Architect and Surveyor, has moved his offices from Cheapside to Palace Chambers, Bridge Street, Westminster.

Institute of Sanitary Engineers.

After March 31st, Mr. Nandy Hoskins, M.S.E., M.R.San.I., F.I.S.E., will cease to act as honorary secretary to this Institute. He will continue to practise, however, from his offices at 120 and 122, Victoria Street, Westminster.

SOCIETIES' MEETINGS.

SHEFFIELD SOCIETY OF ARCHITECTS
AND SURVEYORS.

At the meeting of the Sheffield Society of Architects and Surveyors held on Mar. 9th, Mr. E. M. Gibbs, F.R.I.B.A. read a paper on "The Future Extension of the Suburbs of Sheffield," illustrated by some plans of a development scheme he had prepared, and which, he suggested, might be put forward as data for the preparation of a town-planning scheme for submission to the Local Government Board. His scheme is not for the improvement of the old parts of the city, which cannot be dealt with under the Act, but only for the immediate and effective control of the extensions to suburbs, to prevent them being injured more than is necessary.

The deplorable way in which Sheffield had been and was being extended, said Mr. Gibbs, was generally admitted. Houses were now being erected at the rate of 30 to 40 to an acre, with the smallest or gardens and forecourts, or none at all, and this in suburbs where there was plenty of land close at hand still let for agricultural purposes at £3 or less per acre. This was due largely to the apathy in the past of public opinion, which, however, had now unmistakably awakened, and demanded a remedy for the future. The City Council had recognised the demand by the appointment of a Town Planning Committee, who were having plans prepared for two of the suburbs where building operations were the most rapidly developing. But, while the Act was no doubt applicable to these two suburbs, it was almost equally applicable to others. "The scheme should be applied to all the suburbs and to the full area of each, so that there would be no intervening spaces in which advantage might be taken of the absence of restrictions. Also, as it is uncertain which of the suburbs are most likely to extend, it is desirable to protect the public by the inclusion of the whole. From considerations as to the future growth of the city, it is evidently desirable to include not only the whole of the suburbs, but the whole area within the city boundaries, in the town planning scheme, and this should apply to land now in course of development as well as land at present outside the developed parts."

Mr. Gibbs suggested the formation of a new road connecting the suburbs, and in-

corporating wooded ground as public parks. Starting at Owlerton, the first portion would be across the Valley of the Don and up the wooded valley of Old Park Wood, through Norwood to the bottom of Barnsley Road, to Brightside, Attercliffe Road, Broughton Lane, Darnall, Intake, Gleadless, Hemsworth, Woodseats, Millhouses, Bannerdale, Banner Cross, Nether Green, Sandygate, Hillsborough, and back to Owlerton; while part of an outer ring was suggested from Woodseats via Abbey Lane, Beauchief, Whirlow, Ringinlow, Redmires, and the new road through Wyming Brook to Hollow Meadows.

BIRMINGHAM ARCHITECTURAL
ASSOCIATION.

On March 10th Mr. Selwyn Image, Slade Professor of Oxford, was the guest of the members of the Birmingham Architectural Association. He came down to Birmingham "to address a few words to artists about the seriousness of their calling, and how to commend art to the community," and appealed to them all to do what they could in that direction. What, he asked, could artists do to encourage art as a living thing, as distinct from merely the connoisseurs' and collectors' business? Every one needed to take a very serious view of his own calling. With regard to pupils, or other young people over whom they had any power, the great thing was to exert a steady influence, and one very profitable way would be to get them as much as possible to fall back upon the English traditions of art, which were some of the very finest the world had seen.

INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting of the Institution of Civil Engineers on Tuesday, Mar. 14th, Mr. Philip Dawson, M.Inst.C.E., read a paper entitled "The Electrification of a Portion of the Suburban System of the L.B. and S.C. Railway," from which the following extracts are taken:—The selection of the single-phase system, said the speaker, was at the time very severely criticised by many engineers, and foredoomed to failure; but thirteen months' regular working has entirely justified its adoption. The distance between London Bridge and Victoria is 8.7 miles, and the trains accomplish the distance, including ten intermediate stops of 20 seconds each, in 24 minutes. The results obtained on the

South London line were so satisfactory that the Brighton Company decided to extend the system from Battersea to the Crystal Palace and Selhurst, and from Peckham Rye via Tulse Hill to the Crystal Palace, thus bringing the total length of route electrified to 23 miles, which is equivalent to 62 miles of single track. Difficulties have been experienced, particularly in America, with the overhead conductors; but owing to the flexibility of the design employed, no trouble has been found here, and the extensions are being constructed to exactly the same design as those originally got out for the South London line. Owing to the fact that at Victoria Station porters had to get on to the roofs of the carriages in order to light gas lamps, the height of the conductor is 20 feet in this station and at London Bridge; whereas, the normal working height is 16 feet, and the lowest position under certain low bridges is 13 feet 9 inches. Double-insulation is used throughout, and the only type of insulation employed is porcelain. The underframes of the coaches consist of plate-girders, and the carriages themselves are of a new type as regards this country, being fitted with side doors and having a passage-way between compartments.

LEEDS AND YORKSHIRE ARCHITECTURAL
SOCIETY.

At a general meeting of the Leeds and Yorkshire Architectural Society held on Thursday, March 9th, when Mr. Sydney D. Kitson, F.R.I.B.A. (president) occupied the chair, Mr. W. H. Ward, A.R.I.B.A., read a paper on "The Renaissance Church Architecture of the Sixteenth Century in France."

It was a commonplace, said Mr. Ward, that the history of architecture was in most countries and ages the history of religious architecture. In the Middle Ages if church architecture were eliminated nothing coherent, or very important, would be left. But at the time of the Renaissance, western Europe had largely outgrown the tutelage of the Church, the idea of nationality was developing, and in England, Spain and France the focus of national life was becoming a strong centralised monarchy.

The architectural expression of this state of affairs was to be found, therefore, in secular building, and more particularly in the dwellings of the Sovereign and his

THE ENGLISH BRIDGE, SHREWSBURY, WHICH IT HAS BEEN DECIDED TO WIDEN.

(See next page.)

Court. The architecture of France in the sixteenth century was essentially an architecture of châteaux, of the pleasure-houses of a still half-feudal aristocracy.

Thus it was much more difficult to present a picture of church architecture of this period than of contemporary secular architecture; and, excepting a short list of approximately complete buildings, a history of the style must be compiled chiefly from additions and embellishments to Gothic churches—here a chapel, there a transept, elsewhere a vault or a portal, a tomb, a screen, or a reredos.

St. Eustache, Paris, begun in 1532, was the largest and completest Renaissance church of the century in France; and although practically identical in plan with Notre Dame, it was designed as a whole from the first as a Renaissance building, its Gothic features being clothed with detail inspired from Italian sources.

The lecturer broadly analysed and compared the various parts of this church with contemporary examples elsewhere, and by means of a series of some sixty slides traced the gradual spread of Renaissance ideas—first in the detail and later in the general design—over the ecclesiastical architecture of France.

ABERDEEN SOCIETY OF ARCHITECTS

A meeting of the Aberdeen Society of Architects was held on March 7th, Mr. Arthur Clyne presiding. The annual report alluded, among other matters, to the terms of the School Board's re-appointment of their architect, and the Society's action in regard to it. The ground of the Society's objection was mainly the unfairness, as they considered it, to members of the profession in Aberdeen as a body in giving to any individual architect the monopoly of the Board's work, while extending to him also the privilege of engaging in general practice. The Board, however, declined to see the matter from the point of view of the Society, and the appointment was made on the terms originally proposed.

Mr. Rust gave an exhaustive account of his impressions of the Town Planning Conference, and of the garden cities he had visited near London. He did not see why such a town-planning exhibition should not be held in Aberdeen. Their citizens, he said, were under a deep debt of gratitude to the Aberdeen Land Association for the excellent manner in which they had developed the Rubislaw estate.

Mr. Clyne (who was re-elected president) shared the hopes that the town-planning exhibition might be brought to Aberdeen. It was now in Edinburgh, and there was no reason why it should not go to Aberdeen.

INSTITUTION OF MECHANICAL ENGINEERS.

In connection with his presidential address to the Institution of Mechanical Engineers last week, Mr. Edward B. Ellington showed a drawing of what he termed "possibly the oldest example of mechanical engineering work now extant." This drawing, prepared by Mr. James P. Maginnis, M.I.Mech.E., represented a bronze pump, in the British Museum, found at Bolsena, in Etruria, and attributed to Ctesibius, a barber of Alexandria, who lived in the third century B.C. He was probably a contemporary of Archimedes, the inventor of a screw for raising water. Curiously enough, said Mr. Ellington, a pump constructed on the same principle as Ctesibius's was unearthed a few years ago during the excavations at Silchester, the old Romano-Bri-

tish city situated not far from Reading. This pump, however, was a much cruder affair, made of wood and lead, but it undoubtedly was an effective force pump, and it suggested that such pumps were in considerable demand at the time of the Roman Empire.

GLASGOW INSTITUTE OF ARCHITECTS.

A special meeting of the Council of the Glasgow Institute of Architects was held on March 9th, when the following office-bearers were appointed:—President, Mr. John B. Wilson, F.R.I.B.A.; vice-presidents, Messrs. A. N. Paterson, M.A., F.R.I.B.A., J. K. Hunter, F.R.I.B.A., and R. D. Sandilands, F.R.I.B.A.; secretary and treasurer, Mr. C. J. MacLean, writer, 115, St. Vincent Street; auditor of professional accounts, Mr. George Bell, F.R.I.B.A.

COMPETITIONS.

Penrith Grammar School.

The third premiated design in this competition was the joint work of Mr. Claude Paterson, A.R.I.B.A., and Mr. J. Theo. Halliday, A.R.I.B.A., of Manchester (submitted under the title of Messrs. Halliday and Paterson), not the work of Mr. Halliday alone, as stated in the announcement of awards on p. 285 of our last issue.

New School Buildings, Walisend.

The Council of the Royal Institute of British Architects request Members and Licentiatees not to take part in the above competition.

Chilian National Monuments: International Competition.

The Government of the Republic of Chili are organising an international competition for several commemorative monuments. An independence monument is to take the form of a triumphal arch, in which various stages of the development of the Republic are to be symbolised in four groups in bronze. Ten thousand and five thousand dollars will be awarded respectively to the authors of the first and second premiated designs. Five other monuments will have for their respective subjects the statesmen Camille Henriquez and Zenteno, and the generals Joaquim Prieto, Manuel Bulnes, and Las Heras. For each of these monuments there will be a first prize of 2,000 dollars, and a second of 1,000 dollars. The limit of cost for the Independence monument is 20,000 dollars, and 60,000 dollars must cover the cost of the other five. September 1st, 1911, is the last day for receiving the designs.

LIST OF COMPETITIONS OPEN.

MARCH 21. ELEMENTARY SCHOOL, LUTON.—Luton Education Committee invite architects willing to compete in a limited competition for a new elementary school. Six architects will be chosen to compete, and those who are unsuccessful will receive an honorarium of £5 5s. each. Apply Secretary of Education, Town Hall, Luton.

MARCH 31. CHURCH, NEW CUMNOCK.—Particulars in our issue of March 7.

APRIL 1. MUNICIPAL OFFICES FOR COWENTRY.—Premiums of £150, £175, and £125 for designs for municipal offices and town hall. Mr. E. Guy Dawber, F.R.I.B.A., has been appointed assessor. Particulars from Geo. Sutton, Town Clerk.

APRIL 1. "OWEN JONES" COMPETITION FOR WALL-PAPER DESIGNS, etc. Designs to be submitted to the Board of Education

by April 1. The competition is open to students in schools of design. Six prizes are awarded by the Society of Arts, John Street, Adelphi.

APRIL 6. SEWERAGE AND SEWAGE DISPOSAL, CARLTON.—Scheme required by Barnsley U.D.C. for a portion of the parish of Carlton. Apply to Mr. James Senior, Clerk to the Parochial Committee, Carlton, near Barnsley.

MAY 5. STREET IMPROVEMENT, SWANSEA.—Architects are invited to submit competitive designs and estimates for Castle Street improvement. Block plan and particulars on receipt of one guinea deposit, to be returned to competitors who fulfil the conditions. Premiums: Not exceeding £250 for the architect appointed to prepare the working drawings; £50 to author of design placed second. Mr. S. S. Reay, F.R.I.B.A., has been appointed assessor. Apply Town Clerk, Guildhall, Swansea.

MAY 15. COURT HOUSE, ETC., CHESTERFIELD.—Derbyshire Standing Joint Committee invite designs from architects practising in Derbyshire, for a new court-house and lock-up, to cost £8,000. Assessor, Mr. Frank Baggallay, F.R.I.B.A. Apply to Mr. George C. Copstick, L.R.I.B.A., County Offices, Derby. Deposit of three guineas for particulars.

JUNE 10. SEWERAGE SCHEME, ASPATRIA.—Cumberland U.D.C. invite plans for a scheme of sewerage and sewage disposal. Plans and estimates by June 10, to F. Richardson, Aspatria, Cumberland.

AUGUST 15. MONUMENT AT BERNE, to celebrate the foundation of the International Telegraph Union. Copies of the conditions can be seen at the R.I.B.A. Library, 9, Conduit Street, W. Particulars in our issue of January 11th.

SEPTEMBER 12-25. COURT OF JUSTICE, ATHENS.—Competition open to foreign architects. Cost of building not to exceed £160,000. First and second premiums, £800 and £320. Plans, estimated costs and a fee of £8 required. Particulars to be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

THE ENGLISH BRIDGE, SHREWSBURY.

The proposal to widen the English Bridge over the Severn at Shrewsbury was again revived at a recent special meeting of the Town Council. It was stated that the work would cost at least £6,000 to carry out if the beauty of the bridge was to be preserved, and the Deputy Mayor moved that a sum of fifty guineas be spent in preparing plans, costs, etc.—Dr. Cureton moved that the plans should include a girder bridge structure instead of the present one. There was too much sentiment, he said, about that bridge, and too little common sense.—Alderman Peele said he was perfectly shocked to hear councillors make a proposal to do away with their present beautiful bridge. If they did so Shrewsbury would not be worth living in, as they would be abused from one end of England to the other.—The amendment for a girder bridge was defeated, and the motion carried to prepare plans for widening the present structure.

The bridge consists of seven arches with rusticated voussoirs, with a cornice and balustrading and projecting piers between the arches. The centre of the bridge is marked by a small pediment, and each arch is accentuated by an ornamental keystone. It was built in 1774 from the design by John Gwynne, R.A., and is a fine specimen of eighteenth-century stone bridgework.

DETAILS—OLD AND NEW.

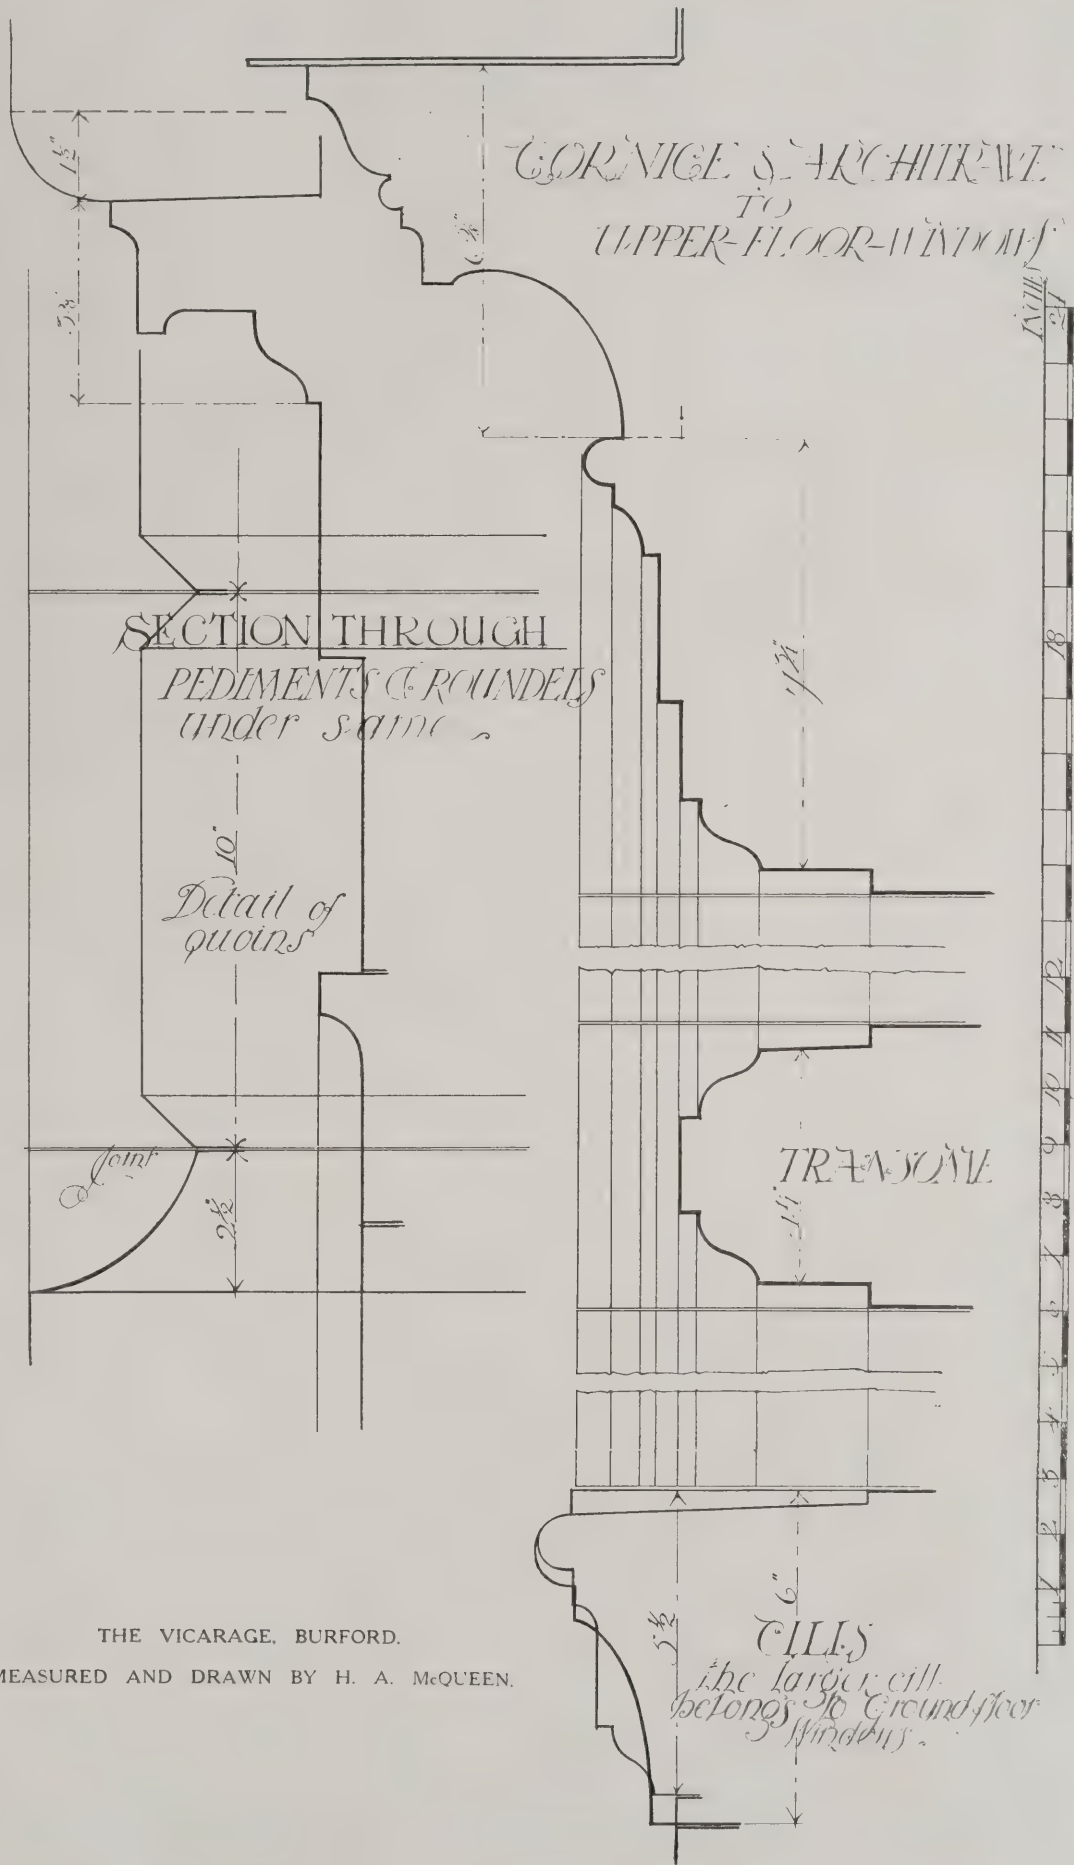

We publish in this issue the first of a new series of detail drawings, with photographs, which we think will be of much interest and value to our readers, more especially as it is our intention to include good examples of new work as well as fine examples of old.

With regard to the Vicarage of Burford, it may be noted that the date cut on the centre tympanum is 1672. The building is a delightful example of the Later English Renaissance carried out in a very unpretentious manner. It is built of closely fitting ashlar with joints rendered quite imperceptible by time. Mr. Gotch, in "The Growth of the English House," uses this building (considering that it is contemporary with Wren's mid-career) to show how architecture of that time pursued two several ways—"the stately, guided by great artists; the homely, guided by unknown artisans." He writes further: "The survival of old ways in remote places is well shown in the Vicarage at Burford. . . . Here there is no attempt at pronounced classic. The roof is gabled, it has no cornice of any account; the windows are mullioned, and the dormers retain some of the fantastic curls of the early years of the century. Nevertheless, in the plainness and precision of the whole treatment, in the flat shape of the mullions, and in the ovals of the dormers, the experienced eye can detect the march of Time."

It was found impossible to draw the stone joints of this simple front.

NEWS ITEMS.

Change of Partnership.

In notifying, on p. 281 of our issue for last week, the retirement of Mr. Rickman from the firm of Messrs. Rickman and Burr, surveyors, and the continuance of the firm under the style of E. J. Burr and Son, we gave the address as 5, Queen Street, instead of 5, Queen Square, Bloomsbury, W.C.

* * *

Surveyors' Golf Tournament.

The Chartered Surveyors' Golfing Society will hold a match play tournament between March 25 and July 31, the winner to hold for a year the challenge cup presented by the council of the Surveyors' Institution and to receive a memento presented by Mr. Leslie R. Vigers, President of the Society, and of the Surveyors' Institution.

* * *

Co-partnership Housing.

Viscount Howick has joined the Board of Co-partnership Tenants, Ltd., whose work as pioneers in housing reform has become so well known through the various tenant society estates at Hampstead and elsewhere. Other changes of the Board that mark the increase of its work are the inclusion of Mr. F. Litchfield among the directors; while Mr. George Morriss has left the Labour Co-partnership Association to become secretary in his place.

* * *

Bristol Royal Infirmary Extension.

On Tuesday last week Sir George White laid the foundation-stone of the new surgical wards which are being added to the Bristol Royal Infirmary as a memorial to King Edward. The architects are Messrs. H. Percy Adams and Charles Holden, of London, and the contractors Messrs. Cowlin and Son, of Bristol. The extension will provide accommodation for 180 additional beds, with three operating theatres. The cost of the work will be £70,000.

* * *

Liverpool Cathedral.

The second part of this great building scheme—namely, the choir and transepts—is to be ready for consecration in the spring of 1915. £43,000 is still required for this work, although £36,000 has already accrued as interest on the capital given to the fund. The work is rapidly progressing, more than 200 men being engaged on it. Mr. G. Gilbert Scott is the architect.

* * *

New Architect for Rochester Cathedral.

Mr. Temple Moore, F.R.I.B.A., of London, has been appointed by the Dean and Chapter architect to Rochester Cathedral. The restored north aisle of the Cathedral was dedicated recently by the Bishop of Rochester. The cost of the work has been defrayed by Mr. Thomas Hellyar Foord, of Botley Grange, Hampshire, a native of Rochester, whose gifts to the cathedral, including the restoration of the central tower and the restoration of the chapter library, have amounted to £8,000.

* * *

New Pavilion and Winter Gardens for Margate.

On what used to be known as Fort Green at Margate work is now in progress for the erection of a new pavilion and winter gardens, to be ready in July next. The undertaking will, with the undercliff promenade, cost from £30,000 to £35,000. The Fort Pavilion will be a unique structure. The old Fort has been excavated

from the top of the cliff to sea level in the shape of a horseshoe 360ft. long and 180ft. wide. Rising from the sea wall will be the pavilion, with frontage of 116ft. It will comprise a concert-room capable of seating 2,500 persons, an open-air arena with a capacity of 1,200, and a covered colonnaded promenade with balconies overlooking the sea and the gardens, and sunk lawns and grounds giving complete shelter from the winds. The concert-hall is to be 140ft. long and 95ft. wide.

* * *

Two Burne-Jones Drawings for Stained-glass Windows.

The two huge pastel drawings by Sir Edward Burne-Jones of "The Nativity" and "The Crucifixion," which were at Christie's recently, have been transferred to the Victoria and Albert Museum by Sir Philip Burne-Jones. They each measure about 19 ft. by 7½ ft., and were the designs for the stained-glass windows in St. Philip's Church, Birmingham.

* * *

Widening of Leadenhall Street.

From the proposals of the City Corporation it appears that the long-delayed widening of Leadenhall Street will most probably be carried out shortly. The widening of the south side of the street to 50ft. was commenced in 1860, and it is now proposed to continue this work, at an estimated cost of £252,800. The scheme would mainly consist of setting back fourteen houses, Nos. 57 to 69.

* * *

Welsh National Library.

The contract for the first section of the Welsh National Library, the foundation-stone of which will be laid by the King in July next, has been let. Ten tenders were received, and the lowest, that of Messrs. H. Willcocks and Co., Wolverhampton, at £50,000, was accepted. Messrs. Willcocks were the contractors for the Edward Davies Memorial Laboratory at Aberystwyth. The total cost of the completed library building is estimated at considerably over £100,000. Mr. Sydney K. Green-slade, F.R.I.B.A., is the architect.

* * *

A Great New Road between Wolverhampton and Birmingham.

It was announced at last week's meeting of the Staffordshire County Council that the Road Board, which derives its funds from the petrol tax and motor licences, had offered £30,000 towards the cost, estimated at £100,000, of the proposed new road between Wolverhampton and Birmingham, passing through the Black Country. Sir Reginald Hardy, Chairman of the Main Roads Committee, said it was proposed to construct a magnificent boulevard, with a fence, trees, and side-tracks for fast and slow traffic. The expenditure by the Council would, it was anticipated, be recouped by the increased assessable value of the building-line on either side of the road.

* * *

A Memorial Column by Mr. Lutyens.

At a meeting of the Attractions Committee at Bath last week, a scheme submitted by Mr. E. L. Lutyens, F.R.I.B.A., for the King Edward Memorial was considered. The Memorial Committee had decided, on the recommendation of the President of the Royal Institute of British Architects, to consult Mr. Lutyens as to the suitability of some site adjacent to the Institution Gardens, and as to the particular form the memorial should take. We understand

that Mr. Lutyens suggests a column, about 80 ft. high. His scheme also provides a considerable improvement in the widening of the roadway on the east side of the Orange Grove, with a very broad pavement encroaching somewhat upon the new portion of the Institution Gardens, where the memorial column would stand.

CORRESPONDENCE.

"Design for a Tall Chimney Shaft."

With reference to the illustrations, on p. 250 of the Journal for March 8th, of a design for a tall chimney-shaft, a firm of steeplejacks and builders of tall chimneys write to the effect that the bonding shown should not be recommended for tall chimney building; and they express the opinion that this class of work should only be undertaken by specialists.

The R.I.B.A. Licentiate'ship.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Your journal and the other professional journals are an educational force, and the Royal Institute of British Architects has set up for an educational and examining force; therefore, its policy should be consistent, or, surely, you will assist in criticising that policy.

Is it consistent to get a lot of men to work up for the examinations of the R.I.B.A., and then quietly open the back door for Licentiates not only to become Licentiates, but very easily, as one can see, Fellows? The result is that numbers of young men who have neglected the examinations are now crowding in as Licentiates.

Stresses in Angle-Cleat Rivets.

[See Journal, Feb. 1st, p. 123; Feb. 22nd, p. 193; and March 8th, p. 246.]

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—With reference to my letter on "Stresses in Angle-cleat Rivets," p. 193, February 22nd, it does not appear that my contention as to the stress on the rivets has been quite clear.

The following sketch, I think, will possibly better show what I mean:—

Let A A be two plates rigidly fixed, and let B, acting as a beam, be another plate secured to plates A by rivets. It is evident that under these conditions there will be no turning moment on the rivets due to any load carried by B, other than that due to any deflection of B. From this it appears that unless plate A can bend at the section X—X, there can be no turning moment on the rivets; or, in the case where plate A is a cleat, if the connection up the flange is strong enough to hold the load as shown in my previous letter.

There seems to have been some misunderstanding with regard to the one rivet mentioned in my previous letter. My idea was to show that if the joint would hold with one rivet, there could be no turning moment, and then that if under the same conditions any number of rivets were substituted for the one, there would still be no turning moment.

BY J. L. BERRY.

These balusters, with the exception of the one marked A (which is Flemish), are eighteenth-century English work, and are principally in pine wood.

THE LEGAL AUTHORITY OF THE ARCHITECT.

BY A. MONTEFIORE BRICE.

In his paper on the above subject, which was read before the Architectural Association on March 20th, Mr. A. Montefiore Brice, of the Middle Temple and the Oxford Circuit, Barrister-at-Law, dealt with cases where the authority of the architect was implied rather than expressed.

SPEAKING generally, an architect may be employed merely as an adviser, or as a designer or draughtsman, or as an agent for the building owner. Usually, of course, he is called upon to discharge all these functions together.

As adviser he holds himself out as possessing the necessary knowledge and skill, and as willing to exercise all reasonable care in giving such advice. No authority is delegated to him by the building owner, because there is none to exercise in this simple relation.

As designer or draughtsman he contracts to supply drawings and a specification executed with reasonable care and skill, and that these shall be capable of being carried out. He warrants no special degree of skill, and the test as to whether he displays enough is whether the skill is so deficient or the case so defective that a bad result becomes inevitable. Again no authority is delegated to him by the building owner, because there is none to exercise in this relation.

But when he adds to these the function of supervision of the works upon which he has advised, or which he has planned, or, less often, when he undertakes to supervise the erection of what others have planned, he becomes the agent of the building owner, invested with certain authority over others, and expressly liable to his employer and to third parties for his use of it.

Terms of Appointment.

An architect may be appointed and invested with the full authority of the terms of his appointment by mere word of mouth, or his appointment may be inferred from the conduct of his apparent principal, or from the ordinary course of dealing, or, as is obvious, it may be shown by a written contract. In practice appointment by written contract is the usual manner, but in law it is only necessary in two cases to make such appointment in writing. In the first case, if the work is not to be performed within the year, or is incapable of being completely performed within the year, then, in order to satisfy the Statute of Frauds, the appointment must be in writing. In the second case, seeing that a corporation aggregate can in general only act by deed, its agent must be appointed by deed. There are exceptions to this second rule, and for certain trifling agencies a corporation can act without deed, while a trading company, though it be a corporation aggregate, can generally act without a deed.

The authority of an architect flows from the terms of his employment as the agent of his employer, and in practice is generally limited (so far, at least, as the relations between the building owner and the builder are concerned) by the terms of the building contract. On the other hand, it frequently happens that where the work is on a small scale, or of an intermittent character, the building owner does not enter into a formal agreement expressing the conditions upon which he delegates his own authority to the architect, and in such cases the limits of that authority must be sought elsewhere than in a formal contract.

The Law of Agency.

The general principles of the law of agency as affecting the authority of the architect are equally applicable whether the appointment is made in writing or otherwise, but in both cases they may be excluded by an express, or what in point of law may be held to amount to an express, provision to the contrary. Failing such express provision, it is clear that the architect's authority (as between his employer and third parties) is to be measured by the extent of his usual employment—a standard which, though it might be readily ascertained in practice, is not unlikely to invite litigation.

Where the architect is the agent of his employer, authorised to act in the name of that employer, he may be the general agent of his employer, and his authority may be restricted within narrower limits. If he be the general agent to the extent of the usual employment of an architect, then he possesses the full apparent authority due to his position, and his employer is bound by all acts of the architect which come within that authority. And whether the terms of the agreement are merely general, or are in part or wholly inconclusive as to the nature of the authority imposed, the architect would be justified in adopting the ordinary and reasonable practice of his profession, and in doing so would be held to be complying with the requirements of the law.

On the other hand, where the authority of the architect is defined by express terms, which may be oral, but are usually in writing, such limitation must be strictly observed. Any infringement of such authority by the architect would release the employer from liability, and render the architect himself liable in damages to injured parties. But the infringement must be material, for the law holds that in the construction of such authority there is present an implied permission to the agent to use the means that are necessary to carry into effect the expressed purpose of the employer.

Thus, in Evans on "Principal and Agent" (2nd edition, p. 178) it is pointed out that when authority is conferred upon an agent by a formal instrument there are two rules of construction to be carefully observed:—

(1) The meaning of general words in the instrument will be restricted by the context, and construed accordingly.

(2) The authority will be construed strictly so as to exclude the exercise of any power which is not warranted either by actual terms used, or as a necessary means of exercising the authority with effect.

Principal and Agent.

A good illustration of this doctrine is afforded by the leading case of *Sharpe v. San Paulo Railway* (1873, L. R. 8 Ch., 597), where it was held, *inter alia*, that the contractors could not on mere verbal promises by the company's engineer (which were unauthorised) maintain against the company a claim to be paid sums beyond the sums specified in the contract, even though the amount of work to

be executed might have been underestimated by the company's engineer; and that as the contract had provided that the certificate of the engineer had been made a condition precedent to payment, such certificate must be held conclusive between the parties in the absence of fraud.

The authority of the architect, whether general or limited, usually extends to his doing all acts required in the process of obtaining tenders and making drawings for and supervising the erection of or addition to the building, for the purpose of which he has been employed. Thus, in *Kimberley v. Dick* (1871, L. R. 13 Eq. 1), Lord Romilly, M.R., said that he must treat the architect as the agent of his employer, "generally, for all purposes connected with this building, and that without any limitation as to price or anything else." Again, Lord Coleridge pointed out in *Laidlow v. Hastings Pier Company* (Jenkins and Raymond, 4th edition, p. 238) that the engineer, from the beginning to the end of the deed, "out of the four corners of which his position is to be collected," was agent to his employers, but as their agent "clothed with peculiar functions exercisable only as provided for by the deed." Where, consequently, an architect allowed the projecting timbers of the adjoining owner to be built into the wall of his employer, it was held that he had exceeded the nature of his employment, and that the act was not within his authority (*Betts v. Pickford's* (1906), 75 L. J. Ch. 483).

Again, if an architect be employed merely to make drawings, he is acting as an independent contractor, a skilled draughtsman, or professional man, and, as no question of agency arises, no question of authority can follow. But if he is making drawings for delivery to the builder, a question of authority can enter as to the warranty that they are correct or that the builder can work to them. But no such warranty can be implied. An illustration of this is to be found in *Thorn v. London Corporation* (1876, 1 App. Cas. 120), where the House of Lords held that where plans and a specification for the execution of a certain work are prepared for the use of those who are asked to tender for its execution, the person asking for the tenders does not enter into any implied warranty that the work can be successfully executed according to such plans and specification. No such warranty would appear in any properly drafted building contract, and if the architect should be so foolish as to warrant such accuracy or possibility to the builder it is he and not the building owner who would be liable to the builder, for it is the architect who has exceeded his express authority.

The Written Contract.

Where the duty and authority of the architect are set out in a written contract there should, as a rule, be little difficulty in ascertaining the extent and limitation of both duty and authority. But all building contracts (in which the provisions for the architect's powers are usually embedded) are not perfect specimens of draughtsmanship, and it is when they become ambiguous, inconclusive, or defective that questions for consideration and settlement arise. It is in such cases that it becomes of the highest importance to know what the implied as opposed to the express authority of the architect may be, and to apply to the omissions or the ambiguities the general principles of the law of agency as modified by the practice of the profession, and as limited by the context of the contract in question.

For example, when the architect has power to order extras he has not, in consequence, the implied authority to order as extras the execution of omissions on his drawings (*Sharpe v. San Paulo Railway, supra*). Nor when his drawings are not practicable has he any implied authority to order as extras work to be done that will render them practicable. Thus, in *Tharsis Sulphur and Copper Company v. M'Elroy and Sons and others* (1878, 3 App. Cas., part 2, p. 1040), where there was a contract for construction for a lump sum, and a clause that no extras should be done without a written order from the employers' engineer, it was held that the certificates of the engineer, though they referred to work done of a more expensive character than that specified for, were not to be regarded as written orders, and that the claim of the contractors was excluded by the contract.

No implied authority rests with the architect either to obtain tenders or to enter into contracts with a builder. Neither is he authorised to negotiate for advances or undertake any preliminary work of this character without an express authority from the owner. If, on the other hand, he has such express authority, he can bind the owner for any reasonable expenses to which he may have been put in the course of conducting such preliminary work.

Though an architect has authority to make drawings for the purpose of the works, he has no implied authority to make such changes in those drawings as would destroy the original scheme. But he has an implied authority to supply drawings of details not shown in the original plan.

Authority for Quantities.

So, too, it has been held that an architect has, when authorised to obtain tenders, an implied authority to engage the services of a quantity surveyor to supply quantities, although it is doubtful whether such architect has any implied authority to take out those quantities himself. But the quantities must comply with the limitations of the architect's authority, and if he be authorised only to obtain tenders not exceeding a certain amount, then he can only have the implied authority to obtain quantities within that amount. But where, as in *Evans v. Carte* ("Times," May 5, 1881), the quantity surveyor brought an action against the building owner for fees for reducing the quantities upon drawings of the architect, which proved too expensive when the tenders came in, and the building owner authorised the architect to reduce the quantities in order to reduce the cost of the building, it was held that the quantity surveyors were entitled to sue the building owner for the cost of such reduction of quantities. And even if the building owner has not originally given the architect authority to reduce the estimates and quantities, but becomes aware of the fact and approves expressly or impliedly, the architect's authority would be confirmed, for, as Lord Coleridge said in the case just cited, "ratification or tacit assent would be equivalent to precedent authority."

In the absence of a limit of price in the contract, the architect has an implied authority to order works for which the builder may recover the price, even though, as a fact, the employer has privately given such limit of price to the architect. As long as the authority can be properly implied, the builder can maintain his claim against the building owner, and it is for the latter to recover damages from the architect for exceeding his authority.

The architect has not an implied authority to dismiss a builder, and consequently any authority so to dismiss must

be expressed, and is usually put into the contract. If put into the contract it must be specific and not general in its application, for it has been held that where there is a clause enabling the architect, should he deem proper, with the written authority of the building owner, to dismiss the builder, the written authority of the building owner must not be in general terms, but must indicate a particular person.

Architect and Sub-contractor.

An architect has no implied authority to bind his employer for the expense consequent upon sub-contractors of the contractor carrying out the orders of the architect, whether by way of original work or of deviations. Nor has he an implied authority to incur on behalf of his employer any liability to specialists unless such specialists can be shown by the terms of the contract to be employed by the building owner. If such specialists are, in fact, the sub-contractors of the principal contractor, then no certificate of the architect can entitle them to claim payment from the building owner; nor can the contractor claim damages from the building owner in respect of any delay caused by such specialists (*Leslie v. Metropolitan Asylums Board* (1901, 68 J.P. 86).

The architect has no implied authority to vary the building contract. His authority, on the contrary, directs him to see that its express terms are carried out. But it is always possible for the parties to the contract to vary it by consent, and to empower the architect to authorise such variations. Where he is empowered to give directions, such directions must be within the expressed limits of the contract (*Sharpe v. San Paulo Railway, supra*).

Similarly, an architect has not the power, unless expressly given, to represent that

the building owner has varied certain conditions—often such conditions as deal with waiver. The contract, when reduced to writing, remains the final agreement of the contracting parties, and no unauthorised representation of the architect can reduce the liability of the builder or impose one on the building owner. On the other hand, should the architect make representations, before the builder has entered into the contract, as to the character of the work he will require, he would be authorised to act subsequently upon such representations, and they would not be held to be varying the terms of the contract unless those terms were inconsistent with the representations. But the making of such representations is loose and ill-advised, and leans to litigation.

An architect has no implied authority to give verbal orders when the contract provides for orders in writing, nor can he dispense with estimates in writing when such are required. But this does not prevent the architect from giving verbal orders or receiving verbal estimates conditionally upon their being reduced into writing before they are to become binding.

The Question of Extras.

As to extras, the architect has no implied authority to vary the conditions which the terms of the contract impose in respect of these items. Nor has he authority to regard as extras such items as are absolutely necessary to complete the contract. The architect will often certify as extras certain works which are not shown on his drawings or mentioned in the specification, or, at least, in the quantities. He has no authority to do so if such details, though not included in the contract by name, are necessarily part of the work. It is the duty of the builder to see whether every-

FIRST FLOOR PLAN

GROUND FLOOR PLAN

This house cost £315, including drains and water supply, and could be built cheaper in a district where the cost of bricks is less (at Farnham the cost is 3s. to 34s. per 1,000).

HOUSE AT FARNHAM, SURREY. HAROLD FALKNER, ARCHITECT.

thing is mentioned in the specification necessary to the completion of a given work, and to allow for such things as may not be described in the specification or shown on the drawings. *Thorn v. London Corporation* (*supra*) clearly laid down that the onus rests on the builder if he tenders on specifications and drawings which are inadequate or not practicable. He must not rely on such drawings or specifications; as Lord Chelmsford said, in the case just cited, "It is an usage of blind confidence of the most unreasonable description." This being so, it is not within the limits of the architect's authority to certify for such extra work which such "blind confidence" might consider extras to the contract. Whether certain work is an extra or is included in the contract may be a question of construction, and demand legal consideration, but it is often within the implied authority of the architect to decide what are extras. Such a power would arise when the contract allows him to decide the construction of the contract: it would also be present if he were empowered to value extras, and were not required to demand or were permitted to waive written orders for extras. This would apply to extras within the contract. But if the extras were so outside the contract that they might be regarded as severed from it, and from any restriction contained in it, it would naturally follow that all the conditions affecting written orders, valuations, and certificates by the architect would thereupon cease to apply, and that the claim by the builder in respect of such extras as these would be found on the basis of a *quantum meruit*, and not upon the contract as controlled by the authority of the architect, whether express or implied.

To put it summarily, an architect has no implied authority to order or contract for extras, and if he abuses his powers in this respect under the contract the builder, who is privy to the contract and yet acts on these unauthorised orders, cannot recover from the building owner (see *Cooper v. Langdon* (1841), 9 M. and W. 60).

"Progress" Certificates.

Similarly, there is no implied authority on the part of the architect to bind the building owner by his progress certificates, unless such certificates conform to the terms of the contract. But if the architect is authorised by the terms of the contract to make a valuation which shall be binding upon both parties to the contract, then he would have an implied authority to issue certificates not so conforming.

The authority of the architect when granting a certificate in his capacity as the agent of the building owner is comprised within the range of such certificates as may be merely ministerial—that is, which do not call upon him for a final opinion dependent on the exercise of judgment and professional skill. In certifying that certain materials have been supplied, that a given amount of work has been done, that something agreed to be delivered has been delivered, that something which the architect had power under the contract to order has been ordered by him and supplied, that the times agreed upon for performance have been complied with—in short, while issuing non-conclusive interim or "progress" certificates—the architect is ordinarily discharging the ministerial duty which he is authorised as agent for the building owner (see *Tindal, C.J.*, in *Morgan v. Birnie* (1833, 9 Bing. 672), and so long as he exercises all proper care, displays all reasonable skill,

and acts honestly and bona-fide, and within the scope of the authority conferred on him by the contract or otherwise, he discharges his liability to the building owner.—Acting in such a manner, he is under no liability to the builder, between whom and him there is no privity of contract. But as soon as his authority is extended to enable him to determine, or assess finally and conclusively, some question of fact between the parties, he ceases to be the agent of the building owner *ad hoc*, and becomes a quasi-arbitrator between the two parties. His authority extends to, nay, it compels, an impartial discharge of this supplementary power, for, as *Collins, M.R.*, observed in *Chambers v. Goldthorpe* (1901, 1 Q. B. 641), he is "clothed with the duty of exercising an impartial judgment." All that is needed to make such judgment binding are the facts that he is not disqualified by some circumstance to act judicially, that he is the person designated by the contract to give the certificate (when the certificate of more than one architect is required a certificate by one will not suffice, see *Lamprell v. Billericay Union* (1849), 3 Ex. 282, 18 L. T. Ex. 282), that he has received authority to certify regarding the subject matter of his certificate, that the power is still in existence, and that the certificate is shown by the contract to be intended to be binding on both parties (*Robins v. Goddard* (1905), 1 K. B. D. 294).

Professional Discrimination.

So, too, a contract will frequently leave many matters to the decision of the architect for the exercise of his professional judgment and skill, not as an arbitrator, who hears and weighs evidence, but as a person on whose special knowledge and capacity both parties rely. In such a case, the authority exercised in individual instances is an implied authority, which depends for its validity upon the fact that it is applied to cases which come within the clause of the contract. For example, where in *Roberts v. Bury Commissioners* (1871, L. R., 5 C. P. 310) the architect had decided that the builder had not exercised due diligence, and the building owner, in consequence, dismissed the builder and determined the contract under the conditions, it was held that the building owner was not entitled to do so, as the contract had not made the architect conclusive judge as to the due diligence. And where the architect's certificate or decision is declared to be conclusive concerning anything in connection with the contract, there is yet no implied authority by which the architect can bind the builder as to the compensation payable by the building owner in respect of his breach of the contract.

Where the architect exceeds his authority, and the builder, nevertheless, complies with his unauthorised instructions, the building owner can repudiate any claim the builder may make in respect of work done in these circumstances, unless, either expressly or impliedly, he has adopted or ratified such unauthorised instructions; and the only measure of relief then open to the builder is a claim by him against the architect for damages for breach of warranty of authority. One of the principles of the law of agency is that a person, whether acting in good faith or not, who represents to a third party that he is the agent of another when he has no such authority, or represents, when authorised to act as such agent, that his authority is other than it is, warrants such authority, either expressly or impliedly, to that third party, and, since his represen-

tation is untrue, is committing a breach of such warranty of authority. For such breach, or for the alternative claim, where a builder would bring an action for damages for deceit founded upon a fraudulent assertion of authority, the measure of damages would be about the same, for the measure would be in almost every case the amount which the builder has lost through acting on the faith of the architect's warranty, together with such profit as would have been made, and such expenses as he may have been put to by any action of the building owner in regard to the work done in accordance with the architect's warranty.

Unauthorised Intervention.

For example, where an architect who was employed to superintend the building of a church falsely represented that he was authorised by the building owners (a committee) to order stone from a certain firm for the building of the church, and the firm, relying on the representation and believing that the architect had authority from the building owners to order the stone on their account, delivered it, and it was used in the building of the church, and subsequently failed in its action against the building owners and had to pay the costs of the successful defendant in addition to their own, it was held that the stone merchants were entitled to recover from the architect not only the value of the stone, but also the costs they had incurred and paid in the action against the building owner (*Randell v. Trimen* (1856), 18 C. B. 786). This was an action for deceit, but an action for breach of warranty would lie, and similar damages would be awarded, even though the architect had the bona-fide belief that the authority he warranted was vested in him.

On the other hand, if the builder has notice of the architect's want of authority, then his right of action against both the building owner and the architect disappears. And, at this date, when building contracts are not only almost universally used, but largely become in course of time of a stereotyped character and singularly complete, it has become increasingly difficult for a builder to say that he has had no notice of what the building owner will be responsible for, and no notice of the extent and the limitations of the architect's authority.

Before closing this paper a few words should be added with respect to the architect's capacity to delegate his authority. The old maxims—"Delegata potestas non potest delegari" and "Delegatus non potest delegare"—apply to architects as to others, but it is settled law that in certain circumstances the delegate may employ subordinates to carry out the details of his work. In *Hemming v. Hale* (1859, 7 C. B., N. S. S. 487), *Williams J.* held that, "Where a man employs an agent, relying upon his peculiar aptitude for the work entrusted to him, it is not competent to that person to delegate the trust to another, but, where the act to be done is of such a nature that it is perfectly indifferent whether it is done by A or B, and the person originally entrusted remains liable to the principal by whomsoever the thing may be done, the maxim, 'Delegata potestas non potest delegari,' does not apply." And in a much more recent case, that of *Graham v. The Commissioners of Works* ("Builder," November 15, 1902, p. 456), it was similarly held by the Court of Appeal in circumstances thus described by the Master of the Rolls:—"By the terms of the contract the architect could order the removal of any materials used in the building that

appeared to him not up to the specified quality. What the architect actually did was to examine the wood on the ground, and, finding that it was not of the required quality, he directed the clerk of the works to mark the timbers already put in the roof of the sorting house to which he objected. Upon that gentleman's report, the architect framed his certificate, and the question was whether in these circumstances the architect could be said to have adjudicated on the matter. It was perfectly obvious as a matter of business that one could not expect an architect to go into every detail himself, and he (the Master of the Rolls) had no hesitation in holding on the authorities that the architect, having himself first ascertained that the timber being used was not of the stipulated quality, was perfectly entitled to delegate the duty of particularising which of the timbers had to be removed." And the Lords Justices concurred in this judgment.

General Conclusions.

But the architect is not entitled to put unreasonable confidence in any person to whom he may delegate his authority, even though that person may be employed by the building owner; and he would be liable in damages to the building owner if, by reason of such unreasonable confidence, he should certify for work which is inferior to the quality required by the contract. For example, where a building owner employed an architect to superintend the rebuilding of a house after a fire, and also appointed and employed the clerk of the works, and the architect, accepting the view of the clerk of the works that certain timbers did not require replacing without himself inspecting such timbers, passed those timbers, it was held by Cave J. that the question whether new timbers were required or not was one for the architect and not for the clerk of works, and that if the architect adopted the view of the clerk of the works without himself inspecting the timbers the responsibility of doing so attached to the architect, who became, in consequence, liable in damages to the building owner (*Lee v. Bateman* (Lord) 1893, "Times," October 31).

To put it briefly, although the architect may delegate certain duties of a more or less ministerial character, he must not abdicate his position or lay down his responsibility as the authorised agent of the building owner.

New York's New G.P.O.

The contract was awarded last week for the erection of the new General Post Office for New York. The building when completed will have cost £500,000, and will have the distinction of being the largest Government office.

The Ecclesiastical Commissioners.

The sixty-third report of the Ecclesiastical Commissioners for England on the proceedings for the year ended October last states that the net rental of estates produced £1,432,100, dividends and interest £435,600, these amounts, together with the balance brought forward, viz., £499,900, making up a total of £2,367,600. Of this amount the payments to benefices, bishops, chapters, and other charges, including expenses of management and income tax, absorbed £1,259,800; £401,200 was appropriated as capital for the further endowment of benefices; £80,000 was transferred to the minerals depreciation fund; £292,900 was applied to writing down securities, and the balance—£333,700—was carried forward to the new account.

ENQUIRIES ANSWERED.

Sub-Contractors and Bill of Variations.

X. writes: "When a contractor lets part of a contract to a sub-contractor at schedule prices in a bill of quantities, is he bound (or is it only an act of courtesy) to give the sub-contractor a copy of the surveyor's valuation of extras and omissions?"

The adjustment of any questions of omission or additions which may arise between the contractor and the sub-contractor must be either regulated by the terms of the agreement made at the time the sub-contract was accepted, by subsequent mutual agreement, or by customary practice. In the absence of specific agreement to provide the sub-contractor with a copy of the surveyor's valuation of extras and omissions, it is only an act of courtesy on the part of the contractor to do so.—

A. G. W.

Wanted a Heat-proof Floor.

Under the above heading we published in our last issue an enquiry from a correspondent inviting suggestions for a heat-proof floor between a bakery and a public hall. Correspondence has been received as follows:—

The Kleine Patent Fire-Resisting Flooring Syndicate, Limited, of 133 to 136, High Holborn, London, W.C., writes: "We would undertake to construct such a floor, with a guarantee that the temperature in the institution room is not affected by the heat of the bakery below. Similar work has been carried out by us over the heating room of a Turkish bath, and also over a boiler room heated to a great temperature."

Another correspondent writes: "Thermos' might employ Jones's patent slag wool and plaster slabs, as used for purpose of thermal non-conduction over the boiler room and under the King's Hall of Holborn Restaurant."

Young Architect and Lic. R.I.B.A.

"IN DOUBT" writes: "Please advise in the following case: A young practising architect in a year or two becomes a fellow of his local institute, which is affiliated to the R.I.B.A. Not being exactly the age required for entering the L.R.I.B.A. class, when this comes about, does he become eligible for election to the Licentiate class?"

—The Council of the Royal Institute have no power to make any exception in the matter of the age limit for Licentiates. Only a change in the Charter would enable them to elect Licentiates under the age of 30.

Liability for Private Street Improvements.

G. writes: "Owners of land edged heavily in black have received notice from the U.D.C., under the Public Health Act, 1875, Section 150, to construct a macadamised road half the width of the intended street, with a footpath alongside the wall from A B to C, and the owners

of the grounds have written to the Council to repudiate liability for the paving in question from B to C. The grounds and mansion were purchased over 12 years ago, and the mansion was converted into an hotel, and it is not intended to lay out the grounds into building sites. From B to C there was a footpath or ancient public right-of-way, with a stile at each end, and alongside this footpath was a farm road with a gate also at each end with open field beyond. The land from B to C and northward was purchased some years ago by a speculative builder, and laid out as a building estate, and for this purpose a 40ft. street was formed alongside the hotel boundary, tramways being constructed by the tramway company, from whom the builder receives a yearly rental. The U.D.C. are now about to construct and pave the roadway properly, and to form a cement or flagged footpath, and they call upon the hotel company to pay a proportion of the cost. The hotel company some ten years ago broke a doorway through the wall, where indicated, forming access to the ancient footpath, which has been maintained by the U.D.C. The Council threaten that if the company succeed in their objection they will not allow them to break out and construct any further entrances in the boundary wall to the hotel grounds. (1) Is the hotel company legally liable to bear the cost of the paving from B to C, seeing that the road is not being made for their benefit, but rather for the benefit of the adjoining estate owner, and that the footpath alongside the wall is an ancient right of way? (2) Have the U.D.C. power to prevent the hotel company from making access to their grounds from the ancient footpath?"

—The answer to this enquiry entirely depends upon whether the road from B to C is a "new street" within the meaning of the Act, or whether it has hitherto been dedicated to the public and repairable by the U.D.C. (as representing the inhabitants at large). I rather gather, from the particulars given, that the entire site of the roadway from B to C is the property of a private person, and that the seats referred to have only been placed there by the expressed, or possibly tacit, permission of that person. Under these circumstances the replies to the numbered queries are:—(1) Yes; the hotel company possess a frontage to the new street, and the question as to whether they intend to employ it or not is quite immaterial. (2) No; the land over which the road passes is not vested in the U.D.C., and consequently it is not for them to say whether any person shall, or shall not, have access to it.

F.S.I.

Post of War Department Surveyor.

X.Y.Z. writes: "Would you kindly inform me to whom application must be made for appointment as a district surveyor to the War Department?"

—The Civil Service Commissioners, Burlington Gardens, London, W., would probably be able to give full information with respect to any vacancies for surveyors in the War Department.

THE BUILDER, THE WORKMAN, AND THE STATE.

BY G. HENRY WRIGHT.

At the fifth annual meeting of Midland Centre secretaries of the National Federation of Building Trades Employers, held at the Imperial Hotel, Birmingham, on the 9th March, the Secretary of the Birmingham Building Trades Employers Association (Mr. G. Henry Wright) read a paper on the National Insurance against Sickness, Invalidity, and Unemployment. It was impossible to enter into the details of the history of national insurance in Germany; the author therefore confined himself to a few of the principal points necessary to elucidate the problem as it presents itself to the English employer. He said:—

The German system of national insurance has been in operation for more than a quarter of a century.

We seem to be in the midst of an epidemic of political sentiment, which may tend to the lessening of our industrial efficiency. Anything which removes the incentive to hard work and to perseverance must detrimentally affect the moral attributes of those from whom the incentive has been removed. Any system of national insurance established for the benefit of the workers should be constructed not only so as not to impose an undue or inequitable burden on the employer, but also so as to make it quite apparent to the employee that he is an effective contributor.

In Germany there is no unemployment insurance. The German system of national insurance covers sickness, invalidity, and old age. It is made up of (1) compulsory thrift on the part of the workers; (2) employers' liability and contributions; (3) State aid.

General compulsory insurance of workmen against sickness in Germany dates from 1883. The number of persons insured in 1903 was over 11,000,000. Contributions depended on the rate of earnings, and varied from $1\frac{1}{2}$ to 3 per cent. of the average earnings. The total contributions worked out at about 18s. per head, towards which the workmen paid two-thirds and the employers one-third. Out of this fund the workmen receive sick pay beginning from the third day of incapacity, for 26 weeks in case of sickness and 13 weeks in case of accident.

The German State system of accident insurance belongs to the same period. The number of persons insured in 1903 was 19,000,000. The whole of the liability after 13 weeks' absence is upon the employers. In 1903 the total receipts represented 8s. per head to the employers, which is considerably less than the liability to employers in this country under the Workmen's Compensation Act, 1906.

The German system of invalidity and old age insurance dates back to 1889. The number of persons insured in 1903 was over 14,000,000, and the contributions represented about 10s. per head—one-half of which was paid by the employer and one-half by the worker. In addition to this every pension is supplemented by a State bonus.

It will thus be seen that in Germany national insurance is a huge system. What are the proportionate burdens? Dr. Shadwell, in his work on "Industrial Efficiency," says that in 1902 the State contribution was £2,000,000, the employers' £10,000,000, and the workers' £9,000,000, whilst the accumulated funds approximated £80,000,000. Sir Kenelm Digby, the Chairman of the Departmental Committee on Workmen's Compensation, in a Memo-

randum issued with the Committee's Report, quoted the following figures showing the incidence of the whole burden of German national insurance in 1901, when the contributions to the threefold system were as follows:—Employers, 45.20 per cent.; employees, 37.64 per cent.; State subsidies 6.43 per cent.; interest on invested funds, 10.3 per cent.

It may truly be said that the burden imposed on employers in Germany is a heavy one, representing, as it does, a payment averaging 19s. per head of all employed. But what is the employers' burden in this country under the Workmen's Compensation Act? No one will deny that it is heavy, and everyone realises that it is continually increasing and that the limit of cost, even under the present law, is not yet in sight. Let us add to this the employers' contribution through State taxes to the old age pensions, and the burdens of the poor-rate on employers for the maintenance of workmen invalidated by chronic sickness or permanent incapacity, or infirmity and premature old age, and I venture to think that the British employer's burden is already more than that which has to be borne by the German.

During the present session of Parliament it is intended to launch vast proposals for national insurance against unemployment, sickness, and invalidity, and these should have the scrutiny and criticism of every association of employers in the country. The Birmingham Chamber of Commerce have had this matter under consideration for some time, and have made frequent efforts to obtain information as to the details—actual or probable—of these proposals. Up to the present these have been refused, and we are therefore thrown back on to such scraps of information as have appeared in the public press.

In 1909, Mr Winston Churchill, then President of the Board of Trade, outlined a scheme of national insurance against unemployment, to be applied in the first instance to the following industries:—(a) building, (b) shipbuilding, (c) engineering, (d) construction works generally, and (e) vehicle making (which presumably includes the cycle and motor car industries). These industries, according to Mr. Churchill, employ about $2\frac{1}{4}$ million men—i.e., one-third of the total number engaged in purely industrial occupations. He stated that the amount of the contributions was not definitely determined, but that they would be something like $2\frac{1}{2}$ d. a week per head from the employer, $2\frac{1}{2}$ d. a week per head from each worker, and $2\frac{1}{2}$ d. a week per head from the State. Out of the fund so created, the bona fide unemployed worker, after seven days' unavoidable unemployment, would commence to receive something like 8s. per week, which might go on for 15 weeks, or longer if the benefits were slightly less. At the end of this period he would drop out, and when he next got employment would begin all over again. The second time he would have to subscribe longer before he became eligible for benefit. The original period of probation was likely to be fixed at about eight months, whilst the next (for those who had dropped out) would be more extended and the next more lengthy still.

In a report prepared by the Birmingham Chamber of Commerce in November, 1909, calculations were made as to what these proposals would mean from a monetary point of view, and from these data the author deduced that the greater part of the

cost of collection would fall on the employer, and only a small part on the administration, and that it would cost 27s. to distribute £20 16s. per annum.

The following paragraph from the Chamber of Commerce report gives the startling result of an examination of the question of cost from the employer's point of view:—"An employer with 100 workmen would pay £54 3s. 4d. per annum, equal to income-tax at 9d. in the £ on an income of £1,440 per annum. If the employer's income was only half this sum, namely, £720 (and many are no doubt less), the cost to him of the insurance scheme would be equivalent to an additional income-tax at the rate of 1s. 6d. in the £. With five times as many workmen the cost would be five times as great, and with ten times as many it would be ten times as great, and the incidence, calculated as income-tax, would remain the same according to the small income of the employer." It should be noted that the above estimate takes no account of the cost to the employer of calculating, deducting, entering, and transmitting the contributions, which might reasonably be estimated at not less than 5 per cent.

While believing in the enormous advantages of a system of national contributory insurance on a compulsory basis, I must confess that these calculations and estimates tempt me to express the view that this additional burden alone is a crushing burden to put on the back of the employer. However, it by no means exhausts the matter, for there are also proposals which will shortly be launched providing a scheme of national insurance against sickness and invalidity. The only statement that has yet appeared in this connection has been a semi-official *communiqué*, which appeared in the daily press on the 4th January, and from which it seems that this scheme is to apply to the whole of the working population of the country whose incomes are below the income-tax level of £160 a year. From the same paragraph it appears that the amount of the insurance is to be 5s. a week between the ages of 16 and 70, and that the contributions to the fund are to be one-half by the workman and the remaining half in equal proportions by the employer and the State.

Assuming that the employers' share will be $2\frac{1}{2}$ d. per week per head, the startling calculations previously quoted would have to be at least doubled, and to this would have to be added the already enormous burden of workmen's compensation and the employers' heavy contributions through State taxes and poor rates to the cost of old age pensions and the maintenance of the pauper classes. It is perhaps well to remark that the employer would not be relieved by the loss of a workman's services through sickness or infirmity, because, first, he would have to employ someone else to take that workman's place; and, secondly, his contributions would be made in respect of the workpeople he employed, and not those who were placed on the insurance fund.

I do not think there would be found many employers who would be averse to the adoption of a comprehensive scheme of national insurance, but I hold that it must be an indispensable condition that the burden is equitably distributed. This obviously cannot be done by super-imposing the German contributory system upon our present system. Serious consideration must be given to the undoubted fact that the effect of the Workmen's Compensation Act, 1906, has been to double the cost to the employers, and that the premiums payable continue to be

increased each year. Practically the whole of the increased cost has been caused by the reduction of the qualifying period from 14 days to 7 days, coupled with the liability to pay compensation from the date of the accident where the workman is disabled for more than two weeks. The question which has to be settled, therefore, is how, with mutual benefit to employer and employed, can a system of national contributory insurance be established? It must be recognised that the cost of production is one of the most important factors in international competition, and that anything which tends to increase this cost in one of the principal competitive areas must react to the disadvantage not only of the employers but also of the workers in that area.

The Government scheme should be so framed as to stimulate effort on the part of industrial workers, and not so as, even in the slightest degree, to undermine those great qualities of independence and self-reliance which have ever been so valuable an asset. How then can this be, at any rate, partly accomplished? In the report of the Chamber of Commerce to which I have referred it is suggested that in connection with any scheme of national insurance against sickness and invalidity, instead of super-imposing the German system the question of grafting it into the English system should be considered. An injured workman in Germany is compensated out of the sickness insurance fund for a period of thirteen weeks. Seeing that the workers are contributors to this fund to the extent of two-thirds, they are personally interested in protecting it

from such abuses as are experienced here in connection with the Workmen's Compensation Act, especially since it was amended and extended in 1906. It is notorious that one of the evils which have arisen out of the law of Workmen's Compensation has been the depletion of the funds of sick and benefit societies, and this has been due to the fact that injured members in receipt of compensation and sick benefit have had no incentive to return to work at the earliest possible moment, as they have been nearly as well, if not better, off without work. There has undoubtedly been a very serious spread of malingering and a corresponding deterioration in the condition of our industrial efficiency. This is, perhaps, the greatest danger which must be guarded against, and it is contended that employers are reasonably entitled to demand that no new burdens shall be imposed upon employers unless there is a readjustment of existing burdens. It is suggested that this might be partly accomplished by making legal provision for injured workmen to be compensated out of sickness insurance fund for a period of not less than four weeks after they become entitled to compensation.

This is a very moderate and reasonable proposal. It would enable the commercial community to regard sympathetically and also to support a well-considered scheme of national insurance, even if it involved them in an extra burden. It would relieve the employer from liability for the great bulk of the trivial accidents of which advantage is taken by the indolent worker on the one hand and the speculative lawyer

on the other, and it would undoubtedly strengthen our industrial efficiency.

I most earnestly urge that it is the bounden duty of every association of employers to give this vital question their most careful consideration and at the earliest possible moment to take steps to place their views before the Chancellor of the Exchequer and their local Members of Parliament.

ST. BARTHOLOMEW THE GREAT, SMITHFIELD.

The Priory Church of St. Bartholomew the Great, Smithfield, was founded by Rahere in 1123, and the Norman portion of the existing building was probably completed in 1133, when King Henry I. granted a Charter of Privileges. Rahere, who was one of thirty canons of St. Paul's Cathedral, and a great favourite at the Court of King Henry I., about the year 1120 went on a pilgrimage to Rome; and while visiting the supposed site of the martyrdom of St. Paul he was attacked with the malaria fever. Recovering, he made a solemn vow that if he were spared to reach London in safety he would build a hospital for its poor. The first building erected was the church, which was gradually surrounded by the buildings and offices necessary for a monastic community—cloisters, infirmary, chapter house, etc., and in this settlement was installed for 400 years a body of the Order of the Canons Regular of St. Austin.

The church is entered from the enclosed churchyard through a new porch erected in 1893, in the base of the tower, which is

CHURCH OF ST. BARTHOLOMEW THE GREAT, SMITHFIELD: VIEW FROM THE NORTH TRANSEPT, LOOKING EAST.

NOTES FROM PARIS.

The Salon of the Société Nationale des Beaux-Arts will be held, as usual, at the Grand Palais, and will open on April 16th, and close on June 30th. Varnishing day will be April 15th. The architectural exhibits for the 1911 Salon of the Société des Artistes Français should be deposited at the Grand Palais des Champs Elysées on April 2nd and 3rd, between 11 p.m. and 5 p.m. Varnishing day is fixed for April 29th, and the opening for Sunday, April 30th.

M. Pams, the French Minister of Agriculture, has received an influential deputation which placed before him the project of building a new Palace of Agriculture, near the Porte Maillot, to take the place of the old Gallery of Machines, and to house the annual national agricultural meeting. M. Pams informed the deputation that he was negotiating on the subject with the Minister of War and the Paris Municipal Council, and he promised to do all in his power to forward the enterprise.

The choice of a site for the new School of Decorative Arts appears to have been at length definitely settled, and it is in the Rue Denfert-Rochereau that the new building will probably be erected. The new buildings, it is stated, will be of only one storey, and will not include residences for the officials. A large garden will be available for open-air study.
